Bank.

By order of the Trustees of Morden College.
GREENWICH.
To Brewers, Licensed Victuallers, and other Investors.
MR. MATTHEW MILES (late Writers,
Lovejoy, and Miles) is instructed to SELL by
PUBLIC AUCTION, at the Masons' Hall Sale Rooms,
E.C., on TUESDAY, DECEMBER 13th, 1898, at ONE
o'clock precisely, the undermentioned very valuable
PROPERTIES, in Two Lots.
A REBUILDING LEASE for EIGHTY YEARS,
at a
Ground-rent of £125 per annum,
with possession at Midsummer next, of
The GLOUCESTER TAVERN,
Fully-licensed Public-house,
with a frontage to King William-street of 169ft. and to
Nevada-street of about 83ft., thus offering exceptional
facilities for early development. This property is most
prominently placed, immediately facing one of the
principal entrances to Greenwich Park, and covers an
area of about
8460 Square Feet.

A REBUILDING LEASE for EIGHTY YEARS,
at a
Ground-rent of £80 per annum,
with possession at Christmas, 1899, of
The DUKE OF WELLINGTON
Fully-Licensed Public-house,
No. 128, Old Woolwich-road,
East Greenwich.
having a superficial area of about 4510 square feet.
This house is well situated for business, and when
rebuilt should command an extensive trade, to which
the improvements now taking place in the immediate
neighbourhood must necessarily contribute.
May be viewed by leave of the respective tenants.
Printed particulars and conditions of sale, with plan,
may be had of Messrs. GOLDING and HARGROVE, Solicitors,
99, Cannon-street, E.C.; of T. BARNES-WILLIAMS,
Esq., Surveyor to the Trustees, 24, Railway-approach,
London Bridge, S.E.; and of the AUCTIONEERS, 55,
Chancery-lane, W.C.

FAIRMILE PARK, near Cobham, Surrey.—A FREE-
HOLD BUILDING ESTATE of about 40 acres, with
possession.

MESSRS. DRIVER and CO. have received
instructions to offer to AUCTION at the MART,
Tokenhouse-yard, Lothbury, NEXT SPRING (unless
previously sold by private contract), the above property,
situate in a favourite residential district, about a
quarter of an hour's walk from the Oxshott and Fair-
mile Station, and about a mile and a half from Cobham
Station. The estate comprises Building Land, ripe for
development, the higher portion (sloping to the south)
possessing charming views over the intervening country
to Epsom Downs; and a Residence known as "South
Lodge," with stabling and garden; Eight small Villas,
some Cottages, and the "Griffin" Beerhouse. On a
portion of the estate brickearth is being worked, and
will be included in the sale as a "going concern."
Particulars and plans, when ready, can be obtained of
CHARLES JUPE, Esq., Solicitor, 43, Lime-street, E.C.;
and of Messrs. DRIVER and Co., 23, Pall Mall, S.W.

B. T. BATSFORD'S
NEW PUBLICATIONS.

ALPHABETS, OLD AND NEW. Con-
taining 150 complete Alphabets, 30 Series of
Numerals, Numerous Facsimiles of Ancient Dates.
Selected and arranged by LEWIS F. DAY. Preceded
by a short account of the development of the
Alphabet. With modern Examples specially
Designed by WALTER CRANE, PATTEN WILSON,
A. BERESFORD PITE, the Author, and others.
Crown 8vo, art linen. Price 3s. 6d. net.

Second Edition, revised and greatly enlarged.

THE ARCHITECTURE OF THE
RENAISSANCE IN ITALY. A General View for
the Use of Students and Others. By WILLIAM J.
ANDERSON, A.R.I.B.A., Director of Architecture at
the Glasgow School of Art. Containing 64 full-page
Plates, reproduced from Photographs and Draw-
ings, and 100 Illustrations in Text, with a specially
compiled CHART of the CHIEF BUILDINGS of the
PERIOD. Large 8vo, cloth. Price 12s. 6d. net.

"We know of no book which furnishes such information
and such illustrations in so compact and attractive a form. For
greater excellence with the object in hand there is not one more
perspicuous."—The Building News.

"A delightful and scholarly book, which should prove a boon
not only to architects and students, but also to clients of 'the
profession.' The large number of illustrations, which enrich the
volume, help the study of the matter to the fullest extent, selected
as they have been with the greatest judgment and perception."—
The Journal of the Royal Institute of British Architects.

"Should rank among the best architectural writings of the
day."—The Edinburgh Review.

An Architectural Causerie.

The "London" of William Hyde. It seems inevitable that an artist of quality, born into a generation of second-rate men, should suffer ill-advised comparisons with the few classics who abide all time. From the persons who so incontinently heralded M. Maurice Maeterlinck as the Belgian Shakespeare, Mr. William Hyde may confidently await his christening as the Turner of to-day. It

given a welcome opportunity for exhibiting the original drawings reproduced therein. That Mr. Hyde is a "nature-artist" in a special sense—a lover of the sternest and yet most elusive moods of weather and light—forces him into challenge with exceptional genius, and tempts some of us into relative criticism which does injustice to his actual power. The present exhibition shows him in two diverse but by no means opposite manners; as intimate with pastoral beauty as with the noonday aspect of the Strand; and while defining the quite acceptable limitations of his talent, leaves us more than satisfied of his fascination within those lines. He is a worshipper of that "Natura Maligna" that "glimmers in the death-wind cold," with her "dire mists, and azure eyes of prey." Rain and frost are his elements, and lurid cloud, and all ungenial twilights, from the loveliest hillside to the heart of the town. Much of his art, indeed, is but a brilliant attack on the impossible; as when, in a "Night Scene, Bermondsey," he tries to reduce to terms of black and white a gas-lit street-corner, with the moon above—a subject in which the very essence

it. He knows it as a living thing—in-satiable, seductive, imperturbable—"Terrible London," as he calls it in what would seem at first sight the least terrible of its aspects, viewed from suburban heights in a mild, calm dawn. Here, as we look closer, that subtle and indefinable terror breaks upon us which we feel sometimes in Nature's most benignant moods. The dawn's placid beauty becomes poignant for what it shines on, reflecting so indifferently the evil and the good. It is high praise to say that Mr. Hyde is able to convey this by sheer composition and atmosphere, without realistic or symbolic detail. "The Nerves of London," a study of telegraph poles from a house-top, is a *tour-de-force* in the idealisation of the commonplace. The familiar platitude about "doing what a photograph can do better" rises to our lips at the marvellous literalism of the picture, but is silenced by the imaginative force which has transfigured a prosaic into a picturesque and palpitating thing. "Utilitarian London," with broader and less exacting materials, fails conspicuously in this imaginative charm—the dull details of a railway junction have escaped

ASHORNE HILL HOUSE, NEAR LEAMINGTON: DRAWING-ROOM ENTRANCE DOORS. - E. GOLDIE, ARCHITECT.

may be well to anticipate this label frankly, and to dismiss it at once as irrelevant to the modest group of black-and-white drawings which Messrs. Dowdeswell, of Bond Street, have now on view. The publication of two luxuriously illustrated books—Mrs. Alice Meynell's "London Impressions," and Mr. George Meredith's "Nature Poems"—has

of the impression is the conflict of colours, utterly unexchangeable, between two different kinds of light. But Mr. Hyde knows London architecture like a poet, and sees it always in a mysterious and fluctuating atmosphere—poetic, and yet relentlessly real. He knows the City in its appalling mass, as well as a hundred typical corners of

that convincing touch. The river studies are treated with a lighter hand. Water, to Mr. Hyde, seems always to be a redeeming element; as though he found in it, amidst all sordidness, a curious compensation and delight. "Below Bridge" (No. 27—Mr. Hyde has an awkward way of duplicating his titles) is one of such; and among others

are "The Last Boat" and "Waterloo Bridge." But it is hardly among well-known landmarks, or even, in the fine studies of St. Paul's, that the artist is at his best. It is in the nameless but typical bye-ways of the city that his pessimism—if it be such—is least forced and most impressive. One of the best examples of this vision, so intimate and actual, of London slums, is a quiet little picture called "The End of a Winter's Day." It might have formed the frontispiece to "Tales of Mean Streets." There are no figures in it—at least none that can be remembered; yet it is full of the suggestion of life. Its grim grey stones and murky windows arrest us like the silent raising of a drop-scene in a play, upon such darkness as lures our eyes to the next action—shadowy, momentous, almost without speech. The London of cheerful noons and gala-days he leaves to painters of a different school. Most of us, however, have gathered from our life in it certain more sombre impressions of the city; memories, perhaps, of some familiar building in fog or snow, or in common gas-light, dusk, or rain. According to such predilections will each London-lover choose his own particular favourites among Mr. Hyde's "Impressions." One of the most popular will surely be the still, cold picture of St. Margaret's and the Abbey after snow. Others will include the little twilight idyll in Kensington Gardens, also in winter; or that "Forgotten Corner" of a churchyard, in which the eighteenth century still broods over sententious epitaphs and once-august gates. In an artist to whom mood and temperament are so much, one finds frequent response to one's own preferences in London landscape and Architecture. It is well that Mr. Hyde can sometimes turn entirely from these things, and take us into the very heart of the woodlands, showing us the most exquisite frost-magic of the trees. Here at least is beauty, seen away from man in the aggregate, though always through the individuality of the seer. And he would not be so genuine a seer if, even in the midst of pastoral joys, the inevitable pensive undertone did not creep in again with the first hint of sentiment life—the folded sheep, the adventurous owl—crowning beauty, as ever, with the knowledge of pain. Mr. Hyde has few notes: they are rare and finely struck; and he is wise not to over-reach his gamut.

E. W.

THE TIMES has been exploiting the Street Noises nuisance. This matter has always seemed to us one which, in the main, adjusts itself. A street hawker whose cries are intolerable to dwellers in Mayfair, is yet a useful member of society in White-chapel, and accordingly he frequents White-chapel and scorns Mayfair. When the street hawker falls to the expedient of making himself a nuisance till he is paid to desist, as did the organ grinder, then, as in the case of the latter, it is time to legislate. For our own part, we would put up with a good deal of personal annoyance rather than see the free life and bright activity of our streets reduced to the dull-flowing mechanism of the commercial day, under a system of petty despotism which characterises, for instance, German towns. There is a more considerable issue at stake in this matter than the welfare or discomfort of a neurotic gentleman. Those who complain of street noises seem chiefly to belong to that class in whom the stress and tension of modern life has engendered a morbid susceptibility to sounds.

MR. W. MILNER was elected a member of the Architectural Association at their meeting held on December 9th, at 9, Conduit Street, Regent Street, W., previous to Mr. Edwin T. Hall reading his paper on "The Position of Architecture Among the Fine Arts."

ON REFLECTION.

Peterborough Cathedral.

At a meeting lately held at Peterborough in aid of the Cathedral Restoration Fund, the Bishop of Peterborough congratulated the assembly, with some justice, on the skill and care with which the work of restoration has up to this time been conducted. The Bishop went on to say that the Dean and Chapter and the Restoration Committee "were now prepared before the whole world to vindicate completely the step so pluckily and perseveringly taken" by them in maintaining an independent attitude in face of the public criticism they provoked two years ago. These must seem "big words" indeed to those who recall the original proposals of the Dean and Chapter for the restoration of the west front. That the restoration has been generally conducted in a spirit of reverence for the inimitable age-scarred stones of the cathedral is greatly due to the independent activity of the S.P.A.B., and the Society of Antiquaries, involving the protest of the majority of those whose names are associated with the vanguard of architectural progress; and also to the wide public interest round the spirited letters of the editor of the Architectural Review to the Daily Chronicle and to Mr. Ruskin's warlike and characteristic protests to the same intent, which appeared afterwards in The Times. Neither Sir A. Blomfield's early advice that it would be necessary to pull down and rebuild above the caps of the great towers, nor the late Mr. Pearson's unmodified scheme involving, in effect, the replacement of the old front with a new one in the same design, would have afforded the Dean and Chapter cause for self-congratulations, nor granted them much hope of vindicating their choice. Let honour be given where it is due. We owe it to the whole-hearted enthusiasm of certain votaries of Art and Architecture, and not to the Dean and Chapter, that Peterborough Cathedral still stands a relic of past ages, rather than a memorial to the Gothic revival.

Urban Inurbanity.

WE need hardly explain that this subject-heading refers to the behaviour of Town Councils in the matter of the architectural competitions which they promote. Readers of this and other Professional journals have grown to expect periodically well-warranted disparagements of the tactics of municipal corporations, and, so far, we see no indications that this expectation should not continue to be justified even to the end of time. When we perceive, on the one side, stout British burghers combined together in committee to cozen architects by this system of so-called "competitions," and on the other, enthusiastic, energetic, young British architects in a virtual conspiracy to support and endorse the system, we know, from innumerable analogies of history, that the dogged perseverance and pluck of the English race will rise superior to all difficulties, and, being once set to its purpose, will triumph over all opposition, including those overwhelming units contributed by reason and common sense. We may realise the bull-dog pertinacity with which promoters and competitors keep the system going when we observe how Urban Councils go through the laborious process of promoting competitions for buildings which they have no hope, much less opportunity, of erecting; and when we remember that it has been estimated that the average number of competitors in public competitions is forty—or, in other words, that every competitor must expect to fail

thirty-nine times for his each success. The incentive to these remarks at this time is afforded by a correspondent, who tells us that in a late competition for public baths at Wimbledon, the drawings for which were sent in on Aug. 16th, the Urban District Council having pledged itself to disqualify any design which involved an expenditure exceeding the stipulated sum of £7000, yet in its "Baths Committee" report named, as deserving the first and second awards, designs which both exceed this cost. The chairman seems to have imbibed the contents of two letters addressed him by the competitors pointing out this injustice, with unwinking stoicism. The final decision of the Council is, however, not yet published, so there is still hope for those of the law abiding competitors who may be inordinately sanguine in disposition. We learn also that the Tavistock Road Competition at Plymouth is giving rise to a great disquiet in the minds of the competitors who supported the project. The drawings were sent in on September 24th, and no assessor has yet been appointed. It is suggested that no reputable architect can be found to assess under the conditions on which the competition was instituted!

CLAIMS by workmen under this Act
Workmen's Compensation Act.

have been numerous reported from the County Courts, the Court of Appeal, and sittings of arbitrators appointed by the Courts. Among recent decisions it has been given that "a building 30ft. high," as described in the Act, does not mean a building which may eventually attain that height, as was ingeniously urged before the judges of the Court of Appeal; and it has been decided that a man employed on a ship in dock is employed "in or about a factory or dock" for the purposes of the Act. The widow of the ticket collector, who, after collecting tickets, got on to the footboard of a train to talk to a friend, and thus met his death, won her case on the grounds that her husband was in the paid employment of the railway company at the time of the accident, and was not guilty of "wilful and serious misconduct;" and the widow of the carman who died from the effects of a fall from a wagon of timber he was loading at his employer's gate, was also allowed compensation, it being decided by Lord Justice Smith that at the time of the accident the man was killed "in course of his employment" and "on, in, or about a factory." Three claims for compensation by workmen or their widows were allowed by the Arbitrator, under the County Court, sitting in the Registrar's Court at Leeds. A petitioner, however, who elsewhere claimed compensation upon one toe and part of a second which he lost in a brickmaking machine, lost his case on the ground of "wilful and mischievous misconduct" by which he met his injuries. Altogether the Act seems as efficacious and satisfactory as it is just and humane. We remember many years ago to have visited the machine-room of a large carpenter's shop of a well-known London firm, where circular saws were screaming on all sides, and men feeding them whose hands were within a few inches of the blades once a minute. We noticed many maimed hands. A foreman had lost several fingers. "Yes," he said, "we most of us get touched sooner or later." There was no attempt to guard or screen these fearful engines, and as soon as a man was incapacitated by one of them he was dismissed and turned away destitute, and someone found to take his place. It is surely a strange irony that a class which is content to prosper under a usage such as this one, should be the first to decry the indolence and callousness of carpenters.

Men Who Build.

No. 54.

MR. EDWARD GOLDIE.

WE know many architects whose natural tastes and bent have predisposed and directed them in the choice of their profession, and whose abilities and enthusiasm have pre-eminently justified that choice; and we know many, also, whose eminence in the practice of Architecture is largely due to the circumstances of their birth and surroundings, and to exceptional advantages for acquiring professional experience and special opportunities of succeeding in the practical application of their knowledge; but we know very few architects in whom a natural gift and facility has been combined with such auspicious circumstance of birth and opportunity as have been the lot of Mr. E. Goldie. The accuracy of the first of these assertions is sufficiently endorsed by the power, and the very remarkable versatility exemplified in the designs which accompany this article, and the truth of the latter will be apparent when we remind our readers that Mr. E. Goldie is the son of Mr. George Goldie, and that he was for some time previous to his father's death partner in the firm of Messrs. Goldie, Child, and Goldie. Mr. George Goldie is best known for his Gothic Ecclesiastic work, and took a foremost place among the more vigorous of the later architects of the Gothic revival. Articled to the firm of Messrs. Hadfield and Weightman, with which he was afterwards connected as a partner, he eventually removed to London and opened in practice on his own account, and to this period are due such well-known works as the Church at St. Wilfrid at York; the Pro-Cathedrals at Kensington, at Durban in Natal, and at Middlesborough. The Cathedral at Sligo was perhaps his most important and best-known work, and, besides many other Roman Catholic churches, the Church of St. John of Jerusalem in Great Ormond Street, "Upsall Castle," and "Weston Manor" in the Isle of Wight are to be attributed to him. In view of the variety of styles in which Mr. E. Goldie has designed, a variety, however, which is not fully exemplified in the illustrations appearing in these pages, and the decision and mastery of which characterise his designs, the son pays a high compliment indeed to his father when he says: "I learnt all the Architecture I know in my father's office."

Mr. Goldie entered his father's office in 1875, when at the age of 19, so that a simple calculation reveals him to be, in point of years, still at the outset of his professional career. In 1880, without having made the student's usual Continental tour, he became in due course a partner in his father's practice, the firm being known as Goldie, Child, and Goldie, and in this capacity his taste and abilities were fully exemplified in the designs for which the firm was justly distinguished. As time went on the senior partner retired almost entirely from the business, and the responsibilities of the firm largely devolved upon the junior partner. When Mr. George Goldie died in 1887, the practice was conducted under the title of Child and Goldie until 1893, when this partnership was dissolved, and Mr. E. Goldie took sole charge of the wide connection and the high reputation attaching to his father's name and practice.

As has been said, the most remarkable quality in the work of the subject of this article, is the very unusual versatility in the uses of style displayed by the architect, and the still more unusual attainment, in an architect of many styles, of a masterly grip and decision in the essential technical and aesthetic qualities of each. It is unfortunate that a demonstration of the versatile nature of the architect's work can only be achieved by the consideration of a much larger number of examples than we are able to illustrate here. We might have given internal views of Hay-

ward's Heath Convent, which show a management of the strict traditional Early Gothic style under difficult and unusual conditions, which so far as may be judged from photographs, has the same subtle convincing quality of antiquity as we must admire, for instance, in Mr. Bodley's work at Magdalen College, Oxford. As an instance of an opposite extreme in point of style we may well choose as an example the drawing-room at Ashorne Hill House. Apart from the design of this beautiful room, there is revealed such a subtle and minute knowledge of the essential qualities and such an intense appreciation of the spirit of the styles of the Early Georgian epoch, as we recognise in the work of a specialist like Mr. Reginald Blomfield. The design raises, even in the experienced critic, the sentiment of English life of a hundred and fifty years ago. There is no false touch; the spirit of past generations is so truly and exactly reproduced and interpreted, that a sort of deception or cheat is imposed upon the beholder, and his admiration is enthralled by qualities which, strictly speaking, are really not architectural

MR. EDWARD GOLDIE.

qualities at all, but rather arouse his sympathies by the human affinity that lives for us all in the Art ideals of a past age and a dead people. This is a sentiment which passes with the general public as due to an architectural quality, and it has contributed more than anything else to the general mis-conceptions, and the complacent ignorance of the public upon all questions of Architecture. It is, therefore, very much to be doubted whether this spirit of design is that in which the interests of the art of Architecture are best advanced, but though the ideal may be cavilled against in the case of churches, and state, and public, and municipal buildings, which have a national character, and should therefore interpret the ideals and impulses of the age in which they are raised; it may still be considered admissible when applied to the highest forms of Domestic Architecture, where the building has primarily a personal interest attaching to the owner, and may be considered as typifying an individual, rather than a national taste and discretion. Mr. Goldie, however, though he shows so keen an insight into the basic elements of the styles in which he composes, is yet no exact advocate of the "Revival" principle. We may realise this if we turn to illustrations of his other works appearing in these pages such as, to take one example, that of the Carmelite Monastery, Kensington, which was his first work designed and executed since his father's practice entirely devolved upon him; and Ashorne Hill House itself is a case to point his unprejudiced attitude, for it exemplifies a principle upon which he insists as not only legitimate, but

desirable. The elevations of Ashorne Hill House are of brick in a free Elizabethan treatment, and the same note is struck in parts of the interior design; the dining-room, however, owes rather to Jacobean traditions, and the drawing-room, as we have noticed, is an encomium on the principles of the early Georgian epoch. Mr. Goldie holds that it adds interest and brightness to a house when it is treated in such various styles as the aspect, plan, and uses of the several rooms may indicate as desirable and fitting, and he has no hesitation in finishing the interiors of his buildings in a style of Architecture other than that of the exteriors, provided always that the manner of the outside work is derived from a tradition anterior to that which characterises the design within.

With regard to the designs illustrated here it may be said that Mr. E. Goldie's reputation as an architect has, like that of his father, though perhaps with less reason, been associated with his ecclesiastic work, and he has in particular had a great deal of special experience in the designing of conventual buildings. These are here represented by a photograph of a convent at Ascot, and a perspective drawing of the large mass of the Hayward's Heath Convent, which has been gradually building for many years about an old house which formed the basis of the convent, and which is even now in course of completion. These two designs exemplify yet again the diversity of Mr. Goldie's methods. Our readers will notice the collegiate form of this latter building, the general arrangement of which may be readily grasped from the perspective view. The planning of these edifices admits of fine effects, the general lines recalling the plans of the conventual buildings of the Middle Ages, for the traditions of such establishments are nearly as old as their origin and are carefully preserved. The general requirements are a cloister, with a church to one side; a chapter-house, perhaps; and a community room and refectory—all accessible from the cloister; quarters for the Superioress and for the bursar (or his equivalent), and also a reception room near the entrance, where visitors may be entertained. A series of small rooms, called "cells," take the place of the monastic dormitory. The Hospital of St. John and Elizabeth, being instituted for the reception of chronic disorders, may be regarded very much in the light of a home, and this quality has been expressed in the elevations. The Church of the English Martyrs, is of the unusual double-nave form of plan. There is a single arcade down the middle of the church, the arches of the naves being sprung from brackets fixed between the windows in the walls of the building. The church, which was planned in accordance with the idea of the incumbent, has never been built. The form of plan, whatever practical advantages it may possess, may be considered in appearance to be no improvement upon the usual form. The central arcade destroys the axiality of the building.

Having said so much of the grip and finish in Mr. Goldie's designs, we may perhaps describe his method of work which is at once characteristic and interesting. When he has established in his mind a clear intention as to the principles and limits of a design he draws it in plan, section and elevation, so far as need be, to 16th in. scale. This design is drawn in pencil, with the finest line, and with an amount of detail and intricacy which must at once set Mr. Goldie's eyesight, as well as his draughtsmanship, on their mettle. The elevations, including the interior elevation revealed by the sections, are lightly washed to indicate the colour tone of their materials, and shaded in places to show the recess and shadow of the main parts. The position of stained glass, frescoes, or other decorative colour effects are indicated with a few touches, the whole, when finished, giving a minute as well as an accurate representation of the building. From this Mr. Goldie's assistants make the general working drawings.

The following is a list of the most important works executed by Mr. E. Goldie since the dissolution of the partnership of Goldie, Child, and Goldie—between the years 1893

CHURCH OF ENGLISH MARTYRS, YORK. MESSRS. GOLDIE, CHILD, AND GOLDIE, ARCHITECTS.

and the present time—Highgate, La Sainte Union Convent; Blakesware, Hertfordshire, part of house, chapel lodge, entrance gates, bridge, for Sir M. Gosselin; completion of Upsall Castle, Yorkshire, for E. Turton, Esq.; Wandsworth, Church of St. Thomas; Chelsea, Church of Our Most Holy Redeemer; Stoke Newington, Home for the Aged Poor; Hayward's Heath, Priory of Our Lady; Blandford Square, chapel and decoration; St. Mary Cray, church; England's Lane, convent and school; Ascot, St. Mary's Convent, Chapel, and School; Harrogate, St. Robert's School; Ashorne Hill, Warwickshire, house and stables for A. M. Tree, Esq.; Hawkesyard, Priory and Chapel; Blackburn, St. Alban's Church; London, Hospital of SS. John and Elizabeth.

A DESPATCH from Wellington, New Zealand, states that the Roman Catholic Cathedral there has been destroyed by fire.

A NEW Orange Hall has been erected in the village of Smithborough, Co. Monaghan. The entire cost was about £150, which sum has almost been cleared off.

THE Conservative Club, Rawtenstall, is being warmed and ventilated by means of Shorland's patent Manchester stoves and patent Manchester grates, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

LADY BURNE JONES is likely to undertake the task of writing Sir Edward Burne Jones's life. A collection of his letters will make a fascinating addition to modern English literature and history and criticism.

THE Plans Committee of the Aberdeen Town Council has just passed plans of property to the value of £17,000. The plan of the Westfield School, estimated to cost £8000, was included in the number, as well as plans of dwelling-houses to be erected at Wallfield at a cost of £3000.

The Position of Architecture among the Fine Arts.*

BY EDWIN T. HALL.

THE subject on which I essay to address you this evening is one of so wide a range, a subject on which so many books have been written, that I cannot hope to treat it fully in the limited time at our disposal, but only rather to suggest matter for reflection; and I must at the outset ask your kindly and patient consideration for my shortcomings. In approaching a subject like this, one is at once face to face with the necessity for definitions, and the two at the base of our fabric are: What is fine art? What is Architecture? I suppose we are so used to these terms that we feel rather a shock in being asked if we really understand what we confusedly know. Fine art has been defined as that power whose great end is to give pleasure, and the pleasure we have in contemplation is the higher or intellectual to the exclusion of the lower and sensual. The vehicles by which this higher pleasure is conveyed to us are, of course, the senses, so that we get sensuous and intellectual or reflective pleasure. By hearing and by seeing, fine art is appreciated, and the pleasure it affords is the greater in proportion to its permanent retention by the intellect, and in proportion to the tranquility with which it is so conveyed. Fine art has been also defined as the representation of an intended idea, the expression of an idea in matter, while the ideal in Art is the rejection of a rude and crude act to illustrate an emotion and the selection of a more subtle and poetic mode of illustrating the idea. The definition

of Architecture varies almost with every writer on this subject, and one is sometimes appalled to hear the courage with which a young architect speaks, and, with the confidence begotten of enthusiasm, lauds this building as good Architecture, and decries that as devoid of Architecture. What is this art of Architecture? Mr. Ruskin says in one place "it is a science of feeling more than of rule," in another it is that which "taking up and admitting as conditions of its working the necessities and common uses of the building, impresses on its form certain characteristics visible and beautiful, but otherwise unnecessary." So that in his view Architecture is a gloss separate or separable from the building. Mr. Fergusson defines Architecture as "the art of ornamental and ornamented construction." To emphasise this he says that in a building it is the art of the engineer which consists "in selecting the best and most appropriate materials, and using them in a scientific way, and where the engineer leaves off the art of the architect begins." In other words, the planning and the

CONSTRUCTIONAL DESIGN

of the building are works anterior to the "architecture" of it, this being a superimposed ornament. Indeed, he gives us an illustration of a building, and shows how he adds Architecture to it. M. Viollet-le-Duc takes a different view. He says: "Architecture and construction must be taught together. Construction is the means, Architecture the result. Architectural construction is the employment of materials according to their quality and their adaptability with the idea of satisfying a want by the most simple and solid means, giving to the constructed object the appearance of durability and proper proportion, subject to certain rules imposed by the senses, reason, and human interest." Briefly, a building must be

* A paper read before the Architectural Association on Friday, Dec. 9th, 1898.

UNIVERSITY OF ILLINOIS

devised by one mind so using construction as to result in a work of Architecture described as having specified aesthetic properties. Mr. Eidlitz's definition is less involved than that of M. le-Duc, and carries the point further. He says: "Architecture is the art which models buildings, which teaches the development of structural forms," the word development comprehending the continuous evolution of Architecture as distinguished from its crystallisation into styles. Mr. Statham, in his recent work on "Architecture and the Poets," defines Architecture "from one point of view as the realisation of

AN IMAGINATIVE CONCEPTION

in composition and outline; from another as the craft of building." The first part of this, it seems to me, is well stated, and it might be added that the architect sees mentally the completed building beyond and through the veil of his drawings. The latter definition, however, appears to me to be involved in the former, because, as M. le-Duc says, the craft of building is merely the means used to attain Architecture, which is the end. A drawing can never faithfully represent a building; the depicted block lacks density and an aerial separation from its surroundings. To us who pass our lives among drawings they become a sort of shorthand, and are intelligible in a way they can never be to the uninitiated. Hegel defines a work of Art as the interpenetration of matter and thought. Viewed in this light, the matter in an architectural production is so relatively massive and intractable that to penetrate it with thought is the goal for

which we must laboriously aim, and he who can subordinate the material to the mental in such a production is entitled to rank as an artist, and to rank higher than other artists in proportion to the difficulties of the material in which he has to express his ideas as compared with those in which they have to work. Having endeavoured shortly to put before you some conceptions of fine art and Architecture, I will ask you to consider with me the

RELATIONS OF THE FINE ARTS

one to another in their mode of expression, and from this to endeavour to find what is the best rule of life which will help us most to carry forward the banner of our own art. We shall speak of the arts of music, poetry, the drama, painting, sculpture, and Architecture. Of these painting, sculpture, poetry, and the drama are imitative, music and architecture creative. As ideas in Art must be expressed in language understood of the people, it is essential to convey the artist's meaning by depicting something in imitation of or based on principles observed in nature, that is, in real life. That this is done in painting, sculpture, and the drama is self-evident, but it is also the same in poetry. The poet's conceptions are descriptive of man or of some other work of nature, and the vivid portrayal of the scene or effect desired is a measure of the artist's power. Thus in the Iliad, and Odyssey, Homer's gods and warriors and women are pictures appealing to us by our power to realise them, and the more subtle pictures of poets' thoughts are conveyed by

imitating that which we can grasp from general knowledge. All the imitative arts may raise the subjects they depict from

THE COMMONPLACE TO THE IDEAL.

and the abler the artist the greater his success in this direction. Music has nothing to imitate. It is a spontaneous creation, and it may convey to the mind suggestions of anything or everything in nature. It is probable that music of a kind is almost as old as speech, and we know that at least thousands of years ago musical instruments were used. There are representations of such instruments on Egyptian monuments, and we have descriptions of them in elaborate variety as in use in Assyria and Babylonia. The European music of to-day, the opera, the oratorio, are but a few centuries old. These originated in the fifteenth or sixteenth century, at the time of the great Renaissance. From the exhibitions we had in London a few years ago of Japanese music it would seem that in the extreme East no such development has taken place. That music is but a rhythmic cadence of few tones. Here it has attained such a development that it speaks to us in a language of its own, quite apart from words. It portrays all emotions. But it seems to me it differs from all other arts, in that it is almost incapable of pandering to the lower passions. It is perfectly true that, used with the accompaniments of words and dramatic action, it may and does minister to sensual tastes; but alone it breathes a purer air and tends always to refinement. Luther says, "Music is the grandest and sweetest gift of God. Satan hates music; h

CONVENT, ASCOT. E. GOLDIE, ARCHITECT.

knows how it drives the evil spirit out of us." And many of us can speak of our own experience how often in the battle of life, when we have been almost in despair, music has calmed and softened and elevated us, faith and courage have revived, and we have been

RENERVED TO GREATER EXERTION.

Poetry would appear to be of later origin than music, in that its aim has been to depict that which pre-existed in the human history, or prophetically to discourse of that which is to be. It is the adornment of expressed thought in any form. We recognise it in descriptive histories, and probably no more poetical piece of writing can be found than the Book of Job, written many centuries before Christ. It is a book which Mr. Froude, the historian, goes so far as to say "will one day perhaps, when it is

than the other arts. I propose to consider it together with the sister arts of painting and sculpture, as they have been so intimately associated with it. When the necessity first arose for man to build in order to protect himself from the elements or his natural enemies, his buildings would take their form on

STRICTLY UTILITARIAN LINES,

using the material readiest to hand. Thus in a timbered district a conical hut of wattles covered with leaves would be the first form of shelter—suggested by the drooping branches of a tree—and in an arid or stone district the earliest form would be doubtless the excavation of a hole under a large flat surface slab, the sides of the excavation being lined with stones to support the edges of the large slab and prevent it slipping or causing the earth

The accessible flat roof belongs essentially to the tropics or hot climates, its purpose being to afford opportunities for getting the greatest amount of air by day or by night. Architecture was born when, in the contemplative mood of leisure, the man of the stone inclosure began to reflect that the pillars of his colonnade might be arranged not at the distances necessary to support the various sized stone slabs which came readiest to hand and were used as covers, but at regular intervals, selecting his cover stones to suit, and that he might reduce the rude outlines of his pillars to regular shapes; and the man of the timber house began to think that he might, instead of having a lot of detached rooms, put them together under one roof, and, when they were so joined might remove the separating walls of some and place pillars in their stead.

ASHORNE HILL HOUSE, NEAR LEAMINGTON: DINING ROOM. E. GOLDIE, ARCHITECT.

allowed to stand on its own merit, be seen towering up alone, far away above all other poetry in the world." The influence of poetry on the race is diverse. It may exalt or elevate the soul, it may debase it. Poetry, being a form of speech, can be artistic while it panders to the lowest of our natural appetites. The drama is a form of poetry depicted by action. Whereas the epic poem appealed to the ear, the drama appealed to eye and ear by a more vivid and realistic representation, exciting more profoundly the interest of the audience. In historical sequence it was later than either music or poetry. Probably its date is the sixth or seventh century B.C. Its influence is great, but it is evanescent. It is an acted sermon whether its aim be high or low. It is taken not as daily food, but as an occasional tonic. We now come to that art which is primarily the subject of our consideration to-night, and as such we must consider it in greater detail

on which it rested to give way under its weight. Many such can be seen in Brittany to-day. As the family or clan increased and, with its increase the feeling of greater security obtained, the wattle hut would give way to the larger timber room, and the burrow would be replaced by the building up of stones above the earth to form a walled inclosure. The existence of large flat stones would suggest the formation, inside the inclosure, against its outer walls, of a portion covered with flat slabs supported by pillars of stone on the inside, and this feature in principle is preserved to this day in the cloister or ambulatory of courtyards and ecclesiastical buildings in the West, as well as in the older buildings of the East. In Iceland a large native house is now but a series of detached wooden rooms joined together by a corridor. The high pitched roof arose in countries of heavy snows, and a wise conservatism retains it in variable climates.

Gradually with the process of political and social education which taught him and his neighbours to live in mutual dependence, would come the recognition of the necessity for order and organisation, and these applied to the home would develop the architectural faculty of convenient planning, and so on until the rude congeries of rooms would become an architectural entity, symmetrical and rhythmic, and thus would be evolved what Fergusson calls "the æsthetic form of the technic art." A further development would arise when assured of the stability of the Commonwealth. Man, in contemplating

THE GRANDEUR OF NATURE,

the sublimity of its outlines, the mystery of its forests, the dignity of its rocky terraces, the massing of its lights and shades, would reflect on the mysterious powers which dwell in these, and on the laws which control the

PLAN OF CONVENT, HAYWARD'S HEATH.

(See inset supplement.)

seasons and the storms, and a desire would arise in him to do honour to the Unseen Author of these mysteries by erecting a temple. In such a building the narrow limitations of domestic life would have no place, and the architect, attuning his mind to this great Author, and finding within himself a reflex of that Author—a creative power—would reverently set himself to produce a work which should, in however dim a fashion, reflect the emotions with which nature and his subject had impressed him. In such a structure there would be no place for the lighter moods of life. The predominant key would be dignity; its harmonies, repose, mystery, and symbolism; their combination appealing to mankind in its contemplative mood, conveying an expression, as Ruskin calls it, "often serious and sometimes melancholy—an equivalent for the sorrow, trouble and mystery of human life." It is by gradual process we thus see the art of Architecture vivifying the dry bones of construction, and making them live and speak. This spirit once aroused would permeate the world. The palace would come next, in which the oratorio would be replaced by the opera, expressive of the various phases of life. The

BROAD OUTLINES OF THE STRUCTURE

would be representative of the dignity of life as a whole. Subordinated to this, the various parts would appropriately express the lighter moods. In the temple the mysterious attributes of the Deity would be symbolised and the phases of His worship expressed. In the palace the glory of the Man would be emphasised and enhanced, so that the stranger should be impressed with his majesty and importance. The enclosure would mark that the King's abode was set apart. Through its stately portals, as through a frame, the eye would be led to contemplate the picture within, and a visitor, conducted for the first time through its courtyards and vestibules, its colonnades and halls furnished with the pomp of armed guards, the peopled bustling of a busy place, would be emotionally affected, his senses impressed, and his mind prepared by the time he reached the hall of audience to render homage to the master mind. The effect I have endeavoured to sketch is recorded of the Queen of Sheba when she had been conducted through King Solomon's palace and had seen its magnificence, "There was no more spirit in her." From the palace the spirit of Architecture would, through the ages, percolate downwards, its steps growing slower and its form attenuated as it receded from the centre of wealth and leisure, of culture and refine-

ment, until it would evaporate at the abodes of grinding poverty, at the factory where Mammon alone was worshipped. And here parenthetically I would dare to dissent entirely from Mr. Ruskin where, in the "Seven Lamps," he inveighs against the external

ARTISTIC TREATMENT OF TRADE PREMISES.

He says you must not mix architectural ornament with business, but should only use it for places where you rest. I venture to affirm, on the contrary, that it is in the refinement of the tradesman's surroundings there is most hope for raising the artistic standard of his wares and fabrics, and indirectly of his customers. It seems to me that the external treatment of every building is a matter of the deepest concern to the man in the street; indeed, every building owner in a city should be encouraged to recognise his responsibility

in the architectural treatment of his building as part of the whole street, just as in his moral conduct he has a responsibility to the community. Architectural ornament is to building as the leaves and blossoms are to the structure of a tree—an artistic development of the skeleton, evidencing life—a perfecting. But, like the leaves, it should be characteristic of, and in harmony with, the structure within. The relative position of Architecture among the associated arts of painting and sculpture may be likened to the relation of trees to flowers. The trees are the more stately, the broad features which give dignity and masses of subdued tone to a landscape; the flowers the decorative colour and brightness. The tree in its perfection is, so to speak, a part of the landscape.

PAINTING AND SCULPTURE

are more like the flowers of the earth, bright, poetical, refined. They must be examined near and in detail. They are the companions of leisure and of ease, while an architectural composition is for him who runs to read, for the virile man, the man of activity. So that for a monument to record a great victory or a national achievement, an architectural building is appropriately the medium almost universally chosen, while the sister arts are selected to record a pageant, an act in the great drama—in short, to depict the detail rather than the mass. Architecture seeks to express the more permanent in nature; sculpture and painting the more evanescent, the ever changing. The picture, too, has a frame to inclose it, to remind the onlooker of its limits. A work of Architecture has its own proper place under the vault of heaven, and calls out that it is part of the actual. Now, to be of any living and vitalising value we must bring home Architecture to our daily life and surroundings. I ventured last autumn, in speaking to your President's address, to suggest a doubt as to the wisdom of teaching architectural history in the early stages of the Architectural Association curriculum, and proposed rather that the student's mind should be first trained to understand the principles of Art and of design, not only by studio work, but by the study of buildings.

THE HISTORY COMING LATER

when his trained mind would know better how to appreciate it. Shortly afterwards the Bishop of London, discoursing to teachers of the School Board on learning, said it was useless to start a child's education with the

HOSPITAL OF SS. JOHN AND ELIZABETH

(See inset supplement.)

END ELEVATION OF CARMELITE MONASTERY, KENSINGTON. E. GOLDIE, ARCHITECT.

Witena-gemote, and that it was better to teach him constitutional history by starting with the actual around him—with the policeman whom he knew—and from the present to lead him back step by step, by which means, said the Bishop, he could learn to appreciate history and so get back to the cradle of our Constitution. I feel that is our best position. We should strive to learn the principles constituting the basis of design and to apply the knowledge of construction we possess now—a knowledge wider far than any possessed by the ancients—to meet contemporary wants. Do not suppose I am belittling the study of history or deprecating research. These are of immense value to an architect, but one may be learned in them and never be an architect. Nothing is more cramping or sterilising to the mind than, by becoming saturated with history, to become the slave of "style," be it Classic, or Gothic, or anything else. To design in a recognised "style" is to arrest all Art progress; to always seek for and follow a precedent, be it for grouping or outline, for planing or moulding is

THE NEGATION OF ART.

It is living in the dead past, in a world whose aspirations, whose moral life, whose callings have but little relation to those of our day. Mr. Fergusson tells us what are the "correct" proportions for a room, others what are the correct proportions of a column of an entablature, &c. As Mr. Eidlitz very properly remarks, "if rules of proportion existed, and a knowledge of them enabled men to produce great architectural monuments, architecture would become a trade, and not an art." My younger friends will say all this is true, but so true that it is unnecessary to speak of it.

But I would ask them to look around, to study the buildings only within the earlier years of this century, to read, when they have nothing better to do, the literature of the battle of the styles fifty years or so ago. Mr. Ruskin, in one place, says we are unwise to build in any other style than that of the pointed arch, "because it is the strongest in structure and a beautiful form, while the square head is both weak in structure and ugly in form." The Egyptians and Greeks did not think this.

They certainly knew of the arch. We have recently heard of the discovery of a brick arch in the tomb at Denderah, erected 4000 or 5000 years ago, and yet the architects built their great monuments in the trabeated style. The fact is, we are inclined to worship the great achievements of the artists of the past, and to regard their work rather than the spirit and principles which underlay their work. Had our great

MEDIEVAL CHURCH BUILDERS

been trammelled by precedent and style, how would their marvellous Art achievements have been produced? We should never have had their masterpieces to glorify the land. That which places Architecture above the sister Arts is that while they, with few exceptions, of necessity record emotions and ideas of the past or present, Architecture is, or should be, ever labouring to bring forth a new organic creation, something in sympathy with the needs, the developments, the aspirations of the times. I want to emphasise this word *new* because the aim to be original is often spoken of as though it were a reproach. I am not defending wild and extravagant designs—though even they show life—but it is of the essence of vitality in Art to depict that which has not been, to increase and multiply forms. You will remember in Viollet-le-Duc's "Habitations of Man," there are two principles represented by Doxious and Epergos. Doxious who sees only in ancient Architecture the *summum bonum* of Art, and resents all change, who when he travels through the world for thousands of years is always with a sigh looking back to Egypt. This is the spirit of the rules of proportion, the worship of style, the negation of progress in science and Art. Epergos, on the other hand, sees in the evolution and development and in the new offspring of Architecture an evidence of godlike powers given to man, an evidence that life and not death is

THE KEYNOTE OF THE WORLD,

and he urges us on to strive, not to stagnate. If we approach an architectural design from the point of view of grasping the purposes for which the building is wanted, so planning it that its various parts adapt themselves to those purposes in such a way that all seems natural and harmonious; making the entrance-hall impressive and expressive with dignity, spaciousness and hospitality; arranging our windows so that the light shall suit the purposes of the various apartments, aerating with sunshine the various cubes, so that sweetness pervades everything, breaking our large floor areas by columns, forming little surprises by arcaded recesses or galleries affording views of any particular picturesque groupings, and making all to grow naturally from our construction, we may produce that which will be both artistic and individualistic, an evidence of thoughtfulness and creative faculty.

(To be continued.)

PLAN OF THE CHURCH OF THE ENGLISH MARTYRS, YORK.

AN ADDRESS TO ARCHITECTS.*

BY MR FRANK W. RICH, F.R.I.B.A.

IT is astonishing what a very small percentage of domestic buildings are the work of architects; those of our friends who reside in detached residences, and who do employ architects, are generally men of simple or quiet tastes, who allow little latitude or scope for design. They generally are possessed of a cherished ideal, a house after their own hearts, often one like a square box, with hipped roofs. This tendency on the part of some of our friends for this modest display is perhaps better so than the other way. It may be called a national characteristic. But however plain or simple our friends desire a house designed, or whatever cranks they may have in their heads either as to the plan or exterior effect, it is our duty as architects to place before them the correct course to be followed, and, whether the house be simple or elaborate, the design should be right, and the plan

A MODEL OF USEFULNESS.

The architects of Newcastle have done fairly well in other walks of Architecture, but in this we are not up to the mark. We have the consolation, as I have said before, of being perhaps as good as our neighbours, but that is not sufficient. The criticism may be a fair one, and the stigma must be wiped out. The British public ever grumble at the costs of works, whether public or private; but if any really fine design be placed before them they are quick to recognise its merits (except members of a Government, or, indeed, of any elective body) and rightly applaud its author, and will gladly face the extra cost rather than a poor design. Our students have done some work during the past session, but one cannot help feeling that there is with our students, as with those in nearly every other similar association, a certain lack of enthusiasm. This is a matter to make us all think seriously whether the plan we follow is a good plan. The whole of our efforts in teaching our younger students at present is voluntary, and however excellent in theory a voluntary system may be, yet there is no shutting our eyes to the fact that the results are not satisfactory, and the reason is not far to seek.

THE TASK OF TEACHING

should, and no doubt does, devolve upon the men of most experience, and of greatest merit; but these men are generally those engaged in active practice, whose every moment is bespoken, rendering it impossible they can do any justice to voluntary teaching. It, after all, very much resolves itself into a money question, that is, the teachers of our students or demonstrators, or whatever we may term them, should be remunerated; to make it worth their while, as in other professions, and the cost involved in this remuneration should be paid by the recipients of the knowledge, and what is more important, is the fact that the teachers should be architects in active practice, the information must not be taught by professional crammers. Architecture is a living Art, and the practice of Architecture carries with it the implication that any person practising it must necessarily be quite to the front in all the endless wants and details of our busy lives, taking advantage of, and working into use, the innumerable facts that science is for ever disclosing; and last, but not least, to possess an enthusiastic and thorough knowledge of what we may safely call

OUR "OLD MASTERS"

and their works—the men who laid down the foundation of our Art, from that Egypt of which we have lately heard so much, down through all the centuries to our own time, building up, in stone and in literature, a colossal and a glorious Art—one which it is incumbent on us to hand down unsullied, and bettered if we can, to future generations. It is on considerations of this nature that the

littleness of our teaching becomes apparent, and the need of a better system being inaugurated. The system of pupilage (as in the apprenticeship system in the building trades) has undergone great changes in our lifetime. Our younger students have, however, all the greater need for information. It is a well-known fact, that one man in every ten would not hesitate to attempt to teach Architecture, so much is it the custom of every man to consider Architecture an art with which he is quite conversant, and, therefore, attacks it gaily with a light heart. He lives in a house, or has business premises, and therefore knows all about it; but, take my word for it, there is no one who knows so much of Architecture as your architect. He spends his life in the study and performance of it; he is in touch with the innumerable wants of the times, and conversant with the record of past centuries, to which I have before alluded. It is to such men to whom I would hand over our younger students. The manner in which this is to be done is the crux of the whole subject. The voluntary system has been tried, and with no particular success. There then only remains the other system, accompanied by the financial consideration. Our Council have given this matter some attention, and know that in this city there exists an institution, the Durham College of Science, where very many subjects of a technical nature, and in touch with Architecture, can be studied, and a scheme for amalgamation with the college on these subjects is at present under consideration by our Council. But

AFTER THE STUDY AND MASTERY OF
TECHNICAL SUBJECTS,

there remains that immense field of true Architecture, embracing the absolutely useful in everyday life, and the absolutely immeasurable field of imagination, or what is more generally termed the fine art of design, a quality beyond the range of examinations. I think we may leave the matter for the present with our Council, who will safeguard our younger friends, and trust the scheme of amalgamation with the College, and also with the Institute, who, I believe, have a plan in embryo, to work in conjunction with allied Societies, not, possibly, so much in technical subjects as with the literature and history of Architecture, will have the effect of putting our students upon a sound footing. But all this points distinctly to some greater scheme looming in the future, a future I imagine not far distant. I should now like to refer to one or two subjects relating to our general practice. I believe we all find, and every day accentuates the position, that the inspection of our works becomes more onerous, owing to circumstances we need not stop to examine here, and the employment of clerks of works has become a necessity to meet the varying changes of practice. But the admittance of a clerk of the works is not always a blessing, and frequently

BRINGS UNCALLED FOR RESPONSIBILITIES

upon us, who have already many to bear. The uprising of so many local and money-spending authorities, who so frequently appoint their own clerks of the works, calls for some decided course of action from our side. Men appointed in this way, are frequently so appointed on political or other questionable grounds, working very often antagonistic to the architect, rendering his position well nigh untenable. We all know, from long experience, that our best-designed schemes may be absolutely wrecked in the performance by the carelessness or ignorance of an inspector. There is no need why any more responsibility should be put upon members of our profession by the faults of others. Therefore, the clear course is apparent—that is, the architect must appoint the clerk of works, as recommended by the Institute, selecting a man who, from his own knowledge, is fully qualified to carry out the work. I think it prudent that the clerk of works should, in the first instance, be paid by the architect, who, in due course, is repaid by his client. I have never known a work suffer when worked on this system, but have known deplorable results follow the other course. It will, I

have no doubt, be well within the knowledge of members, of the increasing vigilance of the City Engineer in respect of the deposit of plans, and the carrying out of buildings. There can be no fault lying with the City Engineer in his efforts to obtain accuracy; it is a quality much wanted, but it, like many other things, all go to make work more costly. Where we do really find a fault, is in the Town Improvement Committee taking such an extended time in approving or disapproving plans. I wish here

TO MAKE A STRONG PROTEST,

on behalf, not only of our members, but of the public generally, against the long interval of time that is lost in the Committee meeting for the consideration of plans, at intervals of fourteen days, causing, in many cases, considerable financial loss to owners of property, and would respectfully ask the Town Improvement Committee to fall in more with the wants of the times, and place their meetings at lesser intervals. I remember, some years ago, when I happened to act as your secretary, the same question arose, and information was obtained from all the chief cities of England and Scotland, as to the usual practice in these matters, when it transpired that, in many of the larger cities, there were much quicker facilities, in dealing with deposited plans, than what obtains in Newcastle. This was communicated to our Town Improvement Committee, but no good resulted. Let us hope they will no longer stand in the way of public business, but take a more enlightened view of the situation. There is not time, in the present rush of business, to wait a fortnight for a decision as to whether a plan is approved, or it is not approved. The public want their work done quickly, and in some instances, where alterations occur in the progress of building, to wait a fortnight, frequently means laying in the work altogether for that period, to the manifest loss of the owner. There is a general feeling that we are becoming very much

OVER-GOVERNED IN MUNICIPAL MATTERS.

Powers are now being sought which will still further interfere with the liberty of the public in building, the strangest part of it being that the public have never asked particularly to have their liberty curtailed in this way; but there is no doubt nine-tenths of these new powers are fads emanating from the mind of some of our City Councillors, and generally for notoriety or elective purposes. This may be plain language, but, speaking for Architecture, we shall find, presently, serious obstacles placed in the way of free design, and the Architecture of our streets reduced, by these Bye-Laws, to a "ditch water" level. It goes without saying, that the picturesque quality of our streets depends entirely on diversity in design, upon one building differing from the other in height, width, disposition of eaves or gables, projections or recesses, or the like. Some there may be found who advocate a design in street Architecture of the "Gower Street" type, but let us hope they are few, or, to fly at higher game, some of the streets of Paris, of the Baron Haussmann period, which, although more grandiose than the former, are equally unsatisfactory in their final effect. The

QUALITY OF STREET ARCHITECTURE

marks down the history of the times, and records the sentiments of the people. We all know the circumstances under which the HAUSMANN buildings were erected, and we all know scores of cities where other circumstances existed, where a free people have given a free scope to their qualities in design, imprinting upon their buildings a strong individuality, rendering their cities interesting in every turn we take. I am the last man in the world who would advocate the abolition of by-laws for the regulation of some building matters; let these matters be confined to health measures and the like, but let us have liberty in design. One is tempted into making these remarks on a suggestion emanating lately from our Town Improvement Committee, and there is the draft for a further Bill now lying at the Town Hall, which should have the careful attention

* The inaugural address of the President of the Northern Architectural Association, delivered at the opening meeting of the session 1898-1899, held in Newcastle-on-Tyne on November 16th, 1898.

of every citizen. While on building matters, we may say a word or two on

A SPECIAL KIND OF BUILDING

very much talked of now-a-days, and much needed, one popularly called a "Fireproof" building; but, as a fireproof building has never yet been built, it is more correct to say a "fire-resisting" building, precisely in the same way as iron or steel safes have changed their names of late. I do not propose here reading an essay on fire-resisting buildings, but merely to call attention to their increasing importance. This is a class of building needing all the skill of skilful men to devise, needing all our powers of observation and investigation to enable us to keep in touch with the times, it is what may be called the "Modern Building." Business, as we all know, moves quicker year by year, and the hazards increase. To have a large and valuable building filled with equally valuable stock burned down about our heads, is too serious an interference with business to be lightly endured. There is often too much theory in the design of fire-resisting building. Fire is a terrible master, but, in it, Dame Nature will have her way; it is, therefore, no use romancing in matters of construction. It is now pretty well agreed that all important or business premises, especially those abutting on public thoroughfares, should be reasonably fire resisting, yet we frequently find them supported on the ground floor entirely on cast-iron columns or steel stanchions. The effect of this, in the event of a fire, is for the whole building to collapse like a pack of cards. It may be said

ARCHITECTS ARE TO BLAME

for this, but it is not so. From what I know of architects, I do not think there is one who in designing a building would, on his own intuitive knowledge of design, ever produce a building standing apparently on plate glass. This iron and plate glass is one of the signs of the times, one of the phases in the history of Architecture of the nineteenth century. The busy City man, in his instructions to his architect, insists on having "All Window," and he has to have it. Therefore, that material, which will bear the greatest load on the smallest section, must be used for supports and, for the rest, glass, for which there is no substitute. But, unfortunately, both these substances are not safe under fire. Here, however, is where the skill of the architect must come in, and here we must rely on our actual experience in fires, noting the effect on building materials, and on well conducted and authentic experiments. I think further that, at this time, it is particularly opportune to refer to fire-resisting buildings, for our methods of construction are altering every day, and, if they are so altering, they may as well alter in the direction of safety. Science has yet a big field before it, there are already many materials in the market of which we can take advantage in constructing fire-resisting buildings, but more efficacious ones are needed. Every one who has noted the great change that has come over

BUILDING MATERIALS DURING THE LAST TWENTY-FIVE YEARS.

and of the wants of the general public, cannot, I believe, help coming to the conclusion, that sooner or later some of our well-known and much used materials, such for instance, as wood, and common lime plastering, will become more scarce, and may, to a great extent, drop out altogether. Already other materials are taking their place. Wood has two great faults (though I am bound to say it has many virtues), it is highly inflammable, and it is highly susceptible to wet and heat; schemes have been tried with a view to render wood less inflammable, but before we can consider our buildings fire-resisting, much more must be done in that direction, that is to say, if wood is used. I alluded earlier in this address to the "rush of business," and it is here where wood fails us. Our clients will not wait, they must have their buildings finished quickly, and expect them to be quite dry in no time, forgetting that the materials of which they are built, are largely mixed with water. If we were, like the shipbuilders, to rivet iron plates together,

and there you are, finished, and as dry as ever it will be, but we have not quite come to that yet. The wood fittings are fixed while the building is reeking with moisture, and when, having had time to imbibe a quantity of this moisture, which expands the fibres of the wood, the heating apparatus is then lighted up, and the woodwork shrinks often to a wreck. It is quite clear that under these circumstances neither of these materials (wood and lime plaster) meet the demands of ordinary practice. Wood on account of its inflammable nature and instability, and lime plaster on account of its wetness and slow setting. There are, as we know, many

EXCELLENT QUICK SETTING PLASTERS

in the market, but then we frequently lay this on to wooden laths, which, in their turn, are upheld by wooden scantlings. In case of a conflagration, all this ends in disastrous results. Indeed, we may go further, and say a great many of the usual modes of construction are wrong, for do we not embed floor, roof, and other timbers in the walls where they rot, and do we not form cavities between floors and ceilings, hollow partitions, skirtings, &c., which form excellent channels for fire? Much of this can be avoided by using a more solid form of construction, but this means more cost; it is the difference between good work and jerry work. The public, after all, have it very much in their own hands to decide. I think all buildings should be built reasonably fire-resisting, especially public buildings, business premises, and country mansions. There seems to have never been a public building so reasonably fire-resisting as the Colosseum of old Rome, and, although such a building is

UNLIKELY TO BE BUILT IN THIS AGE,

yet its lessons should not be lost upon us. A building of to-day would be more composite in its materials, but, take my word for it, simplicity in materials, as in details, is often the secret of good design. It is distressing in the extreme to hear of public buildings being destroyed by fire, probably carrying with it some loss of human life; of immense places of business reduced to a heap of ashes, dislocating trade, and throwing scores of people out of work at a moment's notice; of some old ancestral mansion engulfed in the same fury, destroying, in its irresistible force, not only the building, but, at the same time, priceless works of Art that are lost for ever. It is time, therefore, that more attention was given to fire-resisting buildings, even in a small way, and if wood is still to be used it must be rendered entirely non-inflammable, and which must not much increase its market value or render it unworkable on the bench; or, if wood cannot be so treated, then some other material is wanted

TO FILL UP THE MISSING LINK.

Some material that will be easily worked into all the varied uses to which we now put wood, such as our doors, windows, staircases, and innumerable other things. It must not only be non-inflammable, but must be of such a nature as will admit of its being worked into all the uses I have indicated, and also to be adaptable to all the alterations that occur in ordinary life, such as the alteration of buildings, or even the alteration of a door, or a window, or making a new way through a partition, &c. Wood lends itself easily to all these alterations. It is owing to this very word "alterations" that so many schemes now in the market for fire-resisting purposes fail; but that fatal word "alterations" must be reckoned with, for although the quality of being fire-resisting is a most important question, yet it must go hand in hand with ordinary usefulness, for buildings change owners, and often uses, and alterations become inevitable.

(To be continued.)

A NEW wing in connection with the Whitechurch Cottage Hospital, erected at a cost of £1300, has just been opened.

A NEW Orange Hall has recently been built at Ballymena. Mr. Wm. O'Neil, of Loughconnolly, being the contractor.

FIREPROOF CONSTRUCTION IN AMERICA.

MR. R. W. GIBSON'S paper on "The Construction of Fireproof Buildings in the United States," read before the R.I.B.A. on Monday, December 5th, was followed, as usual, by discussion. Mr. Percival Gordon Smith proposed a vote of thanks to Mr. Gibson.—Mr. Smith said that as Chairman of the Science Committee which initiated this paper he thought he might claim it as an extremely practical one. He believed that those concerned with the erection of large buildings in England would find much that was useful in it. He did not pretend to say that they would ever arrive at the time when those twenty or thirty-story buildings would be accepted in London. The point that occurred to him as being the most difficult was as to the method of

CONTROLLING THESE BUILDINGS

so as to ensure reasonable security. He was glad to hear that the New York Building Law was under revision.—Professor W. C. Unwin said he had seen the buildings with which the paper had dealt. One building he had seen in Chicago was of fourteen floors, containing something like 100 offices. On a moderate computation, something like 7000 persons would be constantly in that building during business hours. In fact, American business habits seemed to make it very convenient that a large number of persons should be within reach of each other rather than in different buildings or different streets. But quite apart from the policy of high buildings, they had the question of iron construction and its strength when masked by masonry or brickwork. In the latest type of the American big building, they had absolute steel construction; every part of the strain going directly to the steel structure. The

WALLS WERE MERE PANELS,

and became thinner as the floors went up. The difficulty of expansion and construction of steel had been found not at all serious. In Chicago difficulties were encountered such as were not met with elsewhere, because buildings were placed on the worst foundations, even 10ft. or 12ft. below the ordinary level of the town, and even from that there were instances of settlements of 4in., and even 8in. and 15in. In general they secured the uniform strength of iron concrete foundations by two fundamental conditions—first, that the pressure per square foot of the foundation should be uniformly distributed and not to exceed 3000lb. or 3500lb. per square foot, and secondly, that in each foundation block resultant pressure should pass from the centre of gravity of the block.—Mr. Lewis Solomon seconded the vote of thanks. He said he was asked to make an examination of the specification of the building they had heard described by Mr. Gibson. What struck him most was

THE COMPLETENESS OF THE SPECIFICATION.

A list of all the stanchions and girders were given, and such matters as electric lighting and heating apparatus were all completely specified. They used Portland cement in the proportion of 1 to 2 of sand; in England this would be regarded as positive waste. Then the bond was different from that used here. Mr. Gibson specified that the bond was to have two headers every fifth course. He was struck by the enormous amount of copper work provided for. Lately there seemed to have been introduced an enormous quantity of copper work. The flooring was mostly ironwork, seven-eighths of an inch thick, not agreed to in England. Then the specifications went on to provide for the best French plate glass. They never heard of French plate glass in England. It was either English or Belgian. It was usual to paint their brickwork, as was provided for in these specifications. The Americans used the word "masonry," where in England it would be brickwork; they used the words "chutes" in cases in which

we used "shoots"; they speak of vault lights where we should say pavement lights. In the diagrams then on exhibition there were several useful features for calculating the weights and strains for each floor, allowing it to be easily ascertained whether there was any fault in the calculations, being much preferable to our system of keeping the particulars on separate papers.—Mr. R. Gifford Read was of the opinion that the paper gave a very good idea of the American way of building high structures, and showed how the Americans differed from us in the

REGULARITY THEY DISPLAYED

in going to work, and their application of purely scientific principles. No doubt they had found much trouble between the iron-work and brickwork men, but the Americans by the plans they adopt stand a very good chance of avoiding this trouble.—Mr. C. H. Brodie stated that the terra-cotta used for fireproof floors in the States was of a comparatively soft and porous composition.—Mr. Max. Clarke said it should be clearly understood that the terra-cotta referred to by Mr. Gibson in his paper was the hard or solid material, not the porous variety mentioned by Mr. Brodie. The latter was noted in the paper as being better in many ways than the hard variety, but was

NOT IN SUCH UNIVERSAL USE,

and in some localities was more expensive.—Mr. Delissa Joseph stated that in this country we should never have the opportunity of building so high as in America, and therefore steel-frame construction did not appear to raise such important issues. As to fireproof construction, he questioned whether capitalists would build more extensively in that direction so long as the fire insurance companies refused to give assistance or encouragement. At the many conferences with the

FIRE INSURANCE COMPANIES,

arranged by the Goldsmiths' Company, in order to see whether the companies would consequently reduce their excessive rates, nothing was arrived at, they deciding to maintain their rates. It was then suggested that the companies should define what they regarded as a model fireproof building, but they refused to give themselves away to that extent. So long as this monopoly was maintained so long would the development of fire-resisting building in London be discouraged.—The vote of thanks was then agreed to, and the president announced that at the next meeting on December 19th, the following papers would be read: (1) "The Application of Electric Power to Practical Purposes in Buildings," by Mr. H. R. J. Burstall, M.Inst.C.E.; (2) "Some Practical Hints on the production and Use of Electricity for Lighting Country Houses," by Mr. Bernard M. Drake, M.E.E.

OAK altar rails have been presented to St. Leonard's Church, Thornton-le-Street, Thirsk, in remembrance of the late Rev. Peter William Watts, formerly vicar of Thornton-le-Street.

At a general meeting of the Society of Oil Painters, Sir George Reid, P.R.S.A., and Mr. Ernest A. Waterlow, P.R.W.S., A.R.A., were elected honorary members, and Messrs. Byam Shaw, R.I., Cecil W. Rea, Mortimer Menpes, R.I., Chas. I'Anson, and Alfred Hartley were elected members.

NINON DE L'ENCLOS took her secret of sempiternal youth and beauty to the tomb. But (says the Paris correspondent of the Telegraph) she left her house behind her. It is still standing in the Rue de Tournelles, with its six stories and its magnificent staircase of artistically wrought iron. The people who live there are not a year younger than they ought to be, but none the less, they refuse to allow the residence of the celebrated Ninon to be touched up or modernised. A rumour circulated lately that the staircase and other relics were going to be removed, and the building renovated. But all the inhabitants of the district rose up against the idea like one man, and prepared a petition to the Conscript Fathers. Their prayer has already been heard, and Ninon's house will be preserved.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

December 14th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

SIR WILLIAM B. RICHMOND, a few days ago, conducted 200 members of the Hampstead Art Society over St. Paul's Cathedral, and showed them the mosaic decorations upon which he and his assistants are engaged. In explaining the work, Sir William told the members of the society that it was initiated by himself, but that, without the industry and intelligence of others, he could not have succeeded at all. There were many hopeful signs which pointed to a better taste in England, in the matter of the Arts and Crafts, than had previously been the case. The Reformation put a stop to church decoration in this country, and the dread of idolatry fostered that terrible dulness which history showed to have been a part of the Puritan spirit.

LITTLE more than a century ago, a Bishop of London refused to sanction the decoration of St. Paul's with Reynolds at the head of the scheme, upon the plea that "nothing would persuade him to sanction the conversion of Protestant St. Paul's into a Romish church." Times had changed, and they were living in times of æsthetic revival; long might it continue. It came to him that he was to have the honour of serving the Church of England, and through her the Art of England, by using whatever abilities might be his in making the metropolitan church as beautiful as he knew how to make it. It was certain that mosaic was the most durable material for decoration in their dirty London. When intended that mosaic should be the decoration. All his workmen, with one exception, were Englishmen, and the exception was a naturalised British subject. In fairness to those Englishmen, he was bound to say that—leaving out all question of the value of his own design—Italy at her best could not show finer mosaic work than they had done in St. Paul's. The materials used were also made by Englishmen, the old firm of glass manufacturers, Messrs. Powell, of the Whitefriars Works. The only merit he claimed was that of having revived the true principles of a lost but most noble decorative Art.

THE Solomon Islands were until recently chiefly noted for savages, malarial fever, and a solid cliff of pure copper. Stern justice is disposing of the first, the second is considered to be grossly exaggerated, and the vision of the third did not survive actual inspection of the new Bonanza. Still, the official report of the British Resident Commissioner much regrets that the disappointment resulting from the failure of the elaborately equipped expedition to find the solid cliff of copper caused the search for minerals to be abandoned.

It will be long, says the report, before persons in such a position to thoroughly test the value of any minerals discovered will again visit the Protectorate, and yet it would be desirable that the locality whence samples containing copper were obtained should be further explored. It seems that the hopes of the expedition, which started from San Francisco—where one would have imagined they were sufficiently inured to wild-cat enterprises at Klondyke to be taken in by a mere Solomon's Island affair—were based upon some fabulous accounts of the existence of gold and copper on San Christoval. Unfortunately, the recorder of the story "was a man of notorious character," although what special form his notoriety took we are not informed. However, the expedition arrived, found but the slightest traces of precious metals, and as for the "solid cliff of pure copper," they failed to find it at all. The "man of notorious character" was leading the expedition, so that the members of it naturally turned to him for information. He was positive that he had seen it; in fact, he had a distinct recollection of the actual spot, and he was evidently troubled in mind when it was not forthcoming. Recognising in Nature an old enemy of his own, he finally decided to attribute the failure to her nefarious methods, and suggested that it must have disappeared in an earthquake. The report is discreetly silent as to whether the "man of notorious character" disappeared from that or other causes. Still, there does not seem to have been so much to complain about, as actual samples assaying 46.94 per cent. of pure copper have been forthcoming.

ONE of the most interesting of the exhibits that are held periodically in London is the Royal Society of Painters in Water Colours. There are always some works to admire, some merit to note. But, apart from this, the number of exhibits is not bewilderingly large. It is possible to examine all the paintings without having a headache to commemorate the event. All the works occupy one large room, and if you wish to enjoy a feast of colour you have but to stand in the centre of the hall, and your eyes will be delighted by bright and brilliant, sombre and dark colouring, which make you forget the gloominess of a London December day. Over 300 pictures and drawings are on the walls and screens, but fifty of these are the work of the late George Prince Boyce, and a very interesting and representative collection is formed. As usual, the West of England is conspicuous at this exhibition. We have works by Mr. Charles Davidson, Mr. Albert Goodwin, Mr. C. Napier Hemy, Mr. S. P. Jackson, Mr. W. Collingwood, and other artists who have gone to the West Coast for inspiration. Perhaps the best of Mr. Hemy's four water colours is "Under the Cliff, Land's End." He has caught the spirit of the angry waves and sky, and in this work he is far more vigorous than in "The Landing Place," another interesting seascape.

MR. DAVIDSON sends no fewer than seven water-colours, and the atmospheric effect in some of them is very striking. In "Borrowdale" there is the soft glow of sunlight over the valley, and in "Morning" the glowing clouds and the weed-covered rocks of the coast combine to make a most effective picture. Mr. Albert Goodwin's works are in his familiar style, and he gives us glimpses of Canterbury, Hastings, Westminster, and Salisbury. Mr. S. P. Jackson's careful, elaborate, and finished paintings are represented by "Trevone Beach," with its rugged slabs of rock and dashing waves, in "Magpie Island, near Henley-on-Thames," and in his striking "Porth Towers, Cornwall." Mr. Sam T. G. Evans gives us a vigorous picture of a "Storm brewing near Newquay," with its lowering clouds and choppy sea. Mr. Matthew Hale sends a painting of the Bristol Channel in twilight, and the familiar "Mount St. Michael, Cornwall," is painted by Mr. Robert W. Allan. There are many other works of general interest in this exhibition, which ought to be visited by all who wish to see the achievement of present-day water-colour painters.

MR. FREDERICK GROVER, of Leeds, has published the results of his experiments on the pressure and explosive efficiency of mixtures of acetylene gas and air. The first series of experiments consisted in exploding mixtures of acetylene and air at atmospheric pressure; the second series with the mixtures compressed to 15lb. per square inch above atmosphere before ignition took place; and in the third series the mixtures were fired at 30lb. per square inch above the atmosphere. It has been thought that great difficulty would be experienced in working a motor on acetylene gas on account of the slow diffusion of the gas with the air. The author experienced less trouble with the ignition of acetylene than with coal gas, when the same time is allowed for the diffusion of each. He therefore anticipates no difficulties in the application of acetylene to motors. It has also been thought that incomplete combustion would lead to a rapid deposit of carbon. After each explosion when the products of combustion were being discharged from the cylinder, a piece of white paper was placed in front of the small pipe from which the products were escaping at a high velocity. This paper was perfectly clean after all the gases had been discharged from the cylinder. This would certainly not have been the case if a large deposit of carbon took place. There is no doubt that with incomplete combustion occasioned by working with too strong mixtures, there would be a serious deposit. The large excess of oxygen with which it is found possible to explode the gas to advantage is a guarantee that no serious deposit in the cylinder is likely to be met with.

At a recent meeting of those who are trying to fight the smoke fiend, the Earl of Meath presided, and Sir W. B. Richmond, R.A., said the proposed body would not take over the duties which were already consigned to the local governing authorities, but they could assist those authorities to carry out the law at present dealing with the question. If they could strengthen and encourage the powers that be, in a very short space of time London would be rid of a considerable portion of a very serious and dangerous nuisance. It was not an æsthetic or artistic agitation, but one which was of great interest to every class and section of society. He had received letters in favour of the movement from the Duke of Westminster, Lord Hobhouse, Mr. Ruskin, and others. He explained his proposed scheme of working for the society, and the association was formally inaugurated, after some discussion. Mr. Ruskin's letter alluded to "doing battle with that villain smoke."

THE annual prize distribution in connection with the Goldsmith's Institute took place the other evening. A large number of valuable prizes were won in many competitions connected with the various arts and sciences, as well as in scholastic and mechanical subjects. The prizes were distributed by the Right Honourable Lord Davey. In the course of his address he said that he felt sure the enlightened individuals who founded the Institute would feel well rewarded when they contemplated the success it had already achieved. After dealing with different successes achieved by the students, Lord Davey dealt with the recreative side which had been provided. Referring to foreign competition, he said he considered that protection would only aggravate the evil. The true remedy was to put their shoulders to the wheel, and produce better goods than their foreign competitors. He thought it was the duty of every patriot to strive to maintain their commercial greatness, which was only to be done by providing a means for technical education accessible to all classes.

A most interesting exhibition of artistic bookbindings is now on view at 61, Charing Cross Road. The work, which has been carried out by members of the Guild of Women Binders, is remarkable not only for its beauty and finish, but for its great originality. The

designs in every case are fresh, and have been specially thought out, so as to harmonise with the special character and contents of the book for which they may be intended. Among the most beautiful are the mediæval bindings, embossed by hand on undressed morocco. An interesting example of this kind of binding is the work of Mrs. Macdonald. An example of the same kind of binding is the cover of the Kelmscott "Chaucer," which bears a design composed of various details from Sir Edward Burne-Jones's illustrations. A number of beautiful copies of the Song of Solomon are also to be seen. Another case is devoted to examples of "African binding," in which a new and very beautiful Venetian-red morocco from the Niger Territories is employed, embossed in any design on a groundwork of gold dots. The colouring of the leather is extremely rich, and many of the designs shown were very effective. Most visitors will probably covet a Browning or an Omar Khayyam, of which there are several examples in the exhibition, bound in this style, which is at once handsome and durable. A case of bindings sent by Miss Barrett derives a special interest from the fact that all the work has been done by crippled girls under her supervision; but the work need not rely in any way on charitable interest, for it is thoroughly well done. The specimens of cut calf bindings by Miss Sophia Smith are also very effective, and her designs, more particularly for the covers of nursery tales and fairy books, are particularly clever. The exhibition also includes a number of very fine specimens of the work of the Hampstead Bindery, which consists of men binders. An original design is made there for every book bound, and is never repeated unless ordered. The collection includes some examples of the new "Londonderry" binding in cream morocco, on which flowers are inlaid in brilliant colours. Besides the bookbindings, a number of specimens of hand-coloured illustrations by Miss Gloria Cardew are in the exhibition, and are of great interest.

FOR some little time a movement has been on foot in favour of throwing Finsbury Circus Garden open to the public. Difficulties have hitherto stood in the way consequent on the rights of freeholders and leaseholders, and the objection they have to what is considered by some to be an infringement of their privileges. Only about a month ago the matter came before the Court of Common Council in the form of a report by one of the committees, and it was then stated that the Corporation were powerless in the matter owing to the refusal of the residents to concede what was asked. The City Press now states that there is a possibility of an arrangement being come to that will shortly enable the garden to be enjoyed by the many instead of only by a few.

ONE of the strongest evidences of the strides which electricity as an illuminant and as a motive power is making in Great Britain is to be found in the figures published in connection with the plans, &c., deposited in respect of the Private Bills and Provisional Orders for next Session. The Electric Lighting Orders this year number 114, as against eighty-five last year—a very substantial increase. In addition to this, several important electric schemes will be proceeded with by private Bill. The application for powers is by no means confined to the large centres of population, as many of the smaller urban districts have decided to use the hidden power. Cornwall will this year enter the field for the first time, Penzance and Camborne being the towns applying. If all the London orders are granted, the metropolis will very materially increase its patronage of electricity. In the district of Sheffield the number of applications is well maintained. Scotland is represented by a fair proportion of orders, and one or two from "gallant little Wales," but not a single order is from Ireland. It is clear that gas is feeling the competition, as the few Gas Bills to come before Parliament are nearly all for the purchase by compulsion or agreement of existing undertakings by local authorities. There is only just an odd case of a new gas company to be incorporated.

SIR J. F. D. DONNELLY, Secretary of the Science and Art Department, distributed at Dalston, a few days ago, the prizes gained at recent examinations by the students of the North London and Borough of Hackney School of Art. This Institution, which was founded in 1868, has long been doing important work in North London. Since its establishment it has taught no fewer than 2944 Art students, who have gained among them 6228 Government awards, including 1282 Queen's Prizes. In the Government examinations of the present year 322 successes have been obtained, and in five years thirty-eight scholarships of the aggregate value of £840 have been secured, while Royal Academy Studentships for five years each were gained in 1896 and this year. The subjects of instruction comprise modelling, wood-carving, painting, and drawing, Art needlework, and various kinds of designing.

At Newcastle last week a number of summonses were returned against Solomon Levene, who was charged with having infringed the copyright of several well-known pictures. The information was laid by Mr. Francis Euston Field on behalf of the Fine Art Society (Limited) and others. In the first summons it was alleged that the defendant, not being then the proprietor of the copyright in a picture entitled "First Words of Love," and without the consent of the plaintiffs, unlawfully did copy and multiply for sale the copyright painting by means of photographic reproductions thereof. In other summonses he was accused of having similarly reproduced "Wedded," "Peacemaker," and "Forgiven." According to the prosecution, Levene had for many years carried on this class of business, and had guilty knowledge of the class of trade he was engaged in. When a gentleman painted a picture which happened to be successful it was unjust and unfair that this work should be pirated and produced at a tithe of its value, and that copyrights selling from one guinea up to ten guineas should be sold for 2s.—The magistrates dismissed the charges of multiplying the pictures, but convicted the defendant of having sold imitations of copyrights, and fined him £5 in cash in each of the four cases, with special costs of ten guineas and the court costs spread over the four cases.

ONE of the most painstaking and conscientious artists in the West is Mr. Charles E. Brittan, and the water-colour drawing which he is now exhibiting at Plymouth, at Messrs. Harris and Sons' Bedford Street establishment, bears striking evidence of the excellent progress which this young artist is making. It is a large work, and is unquestionably one of the best, if not, indeed, the very best we have noticed from Mr. Brittan's studio. That straining for effect, which we have had cause to condemn in the past, is absent, and there is proof in the picture that the artist fully appreciates the importance of outdoor work. It is an expansive Dartmoor view taken from Hamilton Down, and its title is "Amid Devon's Alps." In the foreground is a sparkling, rippling stream, and spanning it is an old clapper bridge. Lying here and there are grey, moss-clad boulders, around which bracken and furze, touched by Autumn's "fiery finger," and delicate grasses grow, whilst two or three moorland ponies give life to the picture. To the left the rugged form of Haytor, and to the right the Bowerman's Nose, are seen, and between these familiar landmarks stretch away ridge after ridge of moorland heights, until they become all but lost in the pure light from the rising sun. The background is full of refreshing beauty. A flood of clear, silvery light, interspersed by rays of a warm-r hue, tells that the sun is still below the horizon, and has not yet grown hot and oppressive, but is slowly driving away the mists and fleecy clouds of an autumn morning. The breeziness of Dartmoor and the loftiness and majesty of its tors are pervading elements in the picture, and its atmospheric effects are noticeable; but, apart from these features, the lichen and the mosses, "the humblest and the most honoured of the earth-children," are painted in all their unfading beauty.

R.I.B.A.

THE NOVEMBER EXAMINATIONS.

The asterisk (*) denotes members of the Institute.

THE November Examinations list of the Royal Institute of British Architects has just been issued. It is as follows:—

THE PRELIMINARY.

Agutter: Edwin Albert; Falconhurst, Devonshire Road, Honor Oak Park, S.E. [Master: Mr. J. T. Lee*].

Alexander: James Montgomerie; Greenbank, Ashton, Gourock, Scotland [Master: Mr. Jas. B. Stewart].

Amies: Herbert William; the Vicarage, Barkworth Road, South Bermondsey, S.E. [Masters: Messrs. Truefitt and Watson*].

Anderson: Douglas; Aldersyde, Middleboro' Road, Coventry [Master: Mr. T. R. Donnelly].

Anderson: Herbert Cooper; Wesley Villa, Wesley Road, Leeds [Masters: Messrs. Thos. Howdill and C. B. Howdill*].

Armour: John Laurence; 5, Woodhouse Terrace, Gateshead-upon-Tyne [Master: Mr. W. Lister Newcombe*].

Arthur: John Maurice; West Parkhill, Airdrie [Master: Mr. George Arthur].

Balderstone: John Henry; 128, Railway Terrace, Padiham, Lancs. [Master: Mr. John Gregson].

Barker: Walter Clement; West Grove, Hebdon Bridge, Yorks. [Mr. Wm. H. Thorp*].

Batley: Claude; Little Roundwood, Ipswich [Master: Mr. George Wm. Leighton].

Bennett: Robert; c/o Messrs. Parker and Unwin, the Quadrant, Buxton [Masters: Messrs. Parker and Unwin].

Blacka: Fort Vincent; Victoria Villa, Todmorden [Masters: Messrs. Butterworth and Duncan].

Bladen: Lionel Macdonald Wells; Fairlie, Stone, Staffs. [Masters: Messrs. Lynam, Beckett and Lynam].

Bosom: Alfred Charles; 17, Caledonian Road, King's Cross, N. [Polytechnic Architectural School].

Bowen: Henry Farre; 102, Lansdowne Place, Brighton [Harrison College, Barbados].

Box: Lawrence Ashton; 339, High Street, Cheltenham [Masters: Messrs. H. A. Prothero* and G. H. Phillott].

Boyle: Joseph; Low Wood, 195, Chorley New Road, Bolton, Lancs. [Master: Mr. Robert Boyle].

Bramley: Francis Herbert; Claremont Crescent, Sheffield [Masters: Messrs. Flockton,* Gibbs* and Flockton*].

Bridges: Sydney; 30, Wickham Road, St. John's, S.E. [Master: Mr. George Elkington*].

Buckley: Harry Francis; South Field, Halifax [Master: Mr. Thos. Kershaw*].

Chambers: Theodore Gervase; 4, Bloomsbury Place, W.C. [Tonbridge School].

Chard: Claude Percy; Glen View, Wembdon, Bridgewater (Masters: Messrs. Samson* and Cottam*).

Chilwell: Benjamin Charles; Oakeswell, Wednesday (Master: Mr. C. W. Bosworth).

Church: Guy; Sunny Bank, Waringham, Surrey [Master: Mr. A. Beresford Pite*].

Clarke: Herbert Ford; 56, Great Cheetham Street, Lower Broughton, Manchester.

Claypole: Edward Ernest Blunt; 2, Benedict Road, Brixton, S.W. [Master: Mr. Aston Webb*].

Collings: John Saxby; 68, Jermyn Street, St. James's, S.W. [Master: Mr. J. Osborne Smith*].

Collington: Frederick Edwin; 42, Vicarage Street, Nottingham (Masters: Messrs. Sutton and Sutton).

Commin: Ethel May; Barnfield Road, Exeter [Master: Mr. Frederick J. Commin].

Corking: James William; 42, Jackson Street, Gateshead [Master: Mr. James W. Frazer*].

Cosway: Reginald Wentworth Alfred James; 6, Engineers' Quarters, H.M. Prison, Wandsworth [Master: Mr. T. E. Lidiard James*].

Crickmer: Courtenay Melville; 15, Albert Road, Regent's Park, N.W. [Master: Mr. A. Aitchison*].

Curtis: William Thomas; Harbledown, South Croxted Road, W. Dulwich [Master: Mr. Durward Brown].

Davidge: William Robert; Teddington Park Road, Teddington, S.W. [Master: Mr. M. Hainsworth].

Davies: Alan Hier; Rosemont, Clytha Park, Newport, Mon. [Masters: Messrs. Habershon and Fawckner].

Dyer: Frank; 167, Chorlton Road, Brooks's Bar, Manchester [Masters: Messrs. Booth and Chadwick*].

Elkington: George Leonard; 95, Cannon Street, E.C. [Master: Mr. George Elkington*].

Ely: George Frederick; 32, King Street West, Manchester [Master: Mr. John Ely*].

Forbes: James; 2, Woodlands Terrace, Borough Road, Middlesbrough [Masters: Messrs. R. Lofthouse and Sons*].

Fouracre: John Leighton; 16, Portland Square, Plymouth [Master: Mr. H. J. Snell].

Gardiner: Frank George; 7 and 8, Barton Street, Bath.

Gask: John Harold; Bank House, Todmorden [Masters: Messrs. Barker and Ellis].

Gradwell: Arthur Rowland; Bank Villas, Blackburn [Masters: Messrs. Stones* and Gradwell].

Grant: Robert; Dunheanish, Oban [Master: Mr. Alex. Shairp].

Hall: Amos George Frederick Martin; Huntly Grove, Peterborough [Master: Mr. Martin Hall].

Haswell: Frederick; Monkseaton, Northumberland [Master: Mr. F. R. N. Haswell*].

Haward: Francis Robert Boyd; 19, Nelson Road South, Great Yarmouth [Masters: Messrs. Bottle* and Olley].

Hemingway: Willie; 254, Ainsworth Lane, Tonge, Bolton [Master: Mr. Frank K. Thompson].

Hilton: Geoffrey William; Burlaston, Stoke-on-Trent [Master: Mr. G. L. Jones].

Holbrook: Arthur Ernest; Warleigh House, Grove Road South, Southsea [Master: Mr. Alfred H. Bone].

Holder: Archibald Lawrence; 5, Bloomsbury Square, W.C. [Master: Mr. W. West Neve].

Hoskins: Henry Joseph Bissaker; 45, Longmore Street, Birmingham [Masters: Messrs. Cossins, Peacock, and Bewlay].

Hossack: Ian Andrew; 123½, Union Street, Aberdeen, N.B. [Master: Mr. Arthur Clyne].

Huggup: Robert, jun.; Low Hedgeley, Glatton, Alnwick [Master: Mr. Geo. Reavell].

Hussey: Montague Grove; 13, Promenade, Cheltenham [Masters: Messrs. Prothero* and Phillott].

Judge: Max; 7, Pall Mall, S.W. [Master: Mr. Mark H. Judge*].

Kellett-Smith: Herbert Chippendale; Hill View, West Kirby, Cheshire [Masters: Messrs. Willink* and Thicknesse].

Kennedy: William James; 8, Fettes Road, Edinburgh [Masters: Messrs. Hay and Henderson].

Knapp: Alured Faunce Primatt; [Forest School, Walthamstow].

Lacey: Philip Warner; Selwyn House, Mill Hill, Derby [Masters: Messrs. Naylor* and Sale].

Laycock: Edward Penard; 5, Argyle Terrace, Plymouth [Masters: Messrs. King and Lister].

Leech: Norman Austin; The Walnuts, Pinkney's Green, Maidenhead, Berkshire [King's College Architectural School].

Lethbridge: James Morton; 9, Cholmeley Villas, Highbury, N. [Master: Mr. George Lethbridge*].

McKissack: James; 68, West Regent Street, Glasgow [Master: Mr. John McKissack].

Marwick: Thomas Craigie; 43, Lauder Road, Edinburgh [Master: Mr. T. P. Marwick*].

Millar: Allan Scott; 5, Victoria Square, Reading [Masters: Messrs. Millar and Nasmyth].

Moore: John Kernish; 20, Copeland Road, Walthamstow.

Moss: Harry; 9, Park Road, Alexandra Park, Manchester [Master: Mr. F. W. Dixon].

Nash: William James; 117, Midland Road, Wellingboro', Northants [Master: Mr. Alfred Bucknall].

Newman: Bernard Leigh; Ty-Melyn, Clytha Park, Newport, Mon. [Masters: Habershon and Fawckner].

Parlett: John; 33, Daneville Road, Denmark Hill, S.E. [Masters: Messrs. Colman and Thomas].

Payne: Ernest Henry; 95, Lincoln Street, Barton Hill, Bristol [Masters: Messrs. La Trobe* and Weston*].

Pease: Charles Edward; Lancaster Lodge, Lawriston Road, Wimbledon, S.W. [Masters: Messrs. C. John Mann and Son].

Phibbs: Harry; Williams Street, Brierley Hill, Staffs. [Master: Mr. R. S. Oldacre].

Poulter: Briant Alfred; Collingwood, Camberley, Surrey [Farnham Grammar School].

Preece: John; 62, Miskin Street, Cathays, Cardiff [Master: Mr. David C. Salmond].

Price: Francis Henry; 8, Mount Terrace, Taunton [Master: Mr. C. H. Samson*].

Rainforth: Sydney Herbert; Brier Gate, South Park, Lincoln [Masters: Messrs. W. Watkins* and Son*].

Richmond: Wilfrid Stanley; 89, Victoria Road, Bedford [Bedford Modern School].

Robinson: Francis James; 39, Green Park, Bath [Master: Mr. Mowbray A. Green].

Salvin: Thomas; Melrose, Sheffield Road, Chesterfield [Master: Mr. Charles Hadfield*].

Scott: Archibald; 6, Broompark Terrace, Dennistoun, Glasgow [Masters: Messrs. Thos. Dykes and Andrew Robertson*].

Shebbeare: Henry Vivian, B.A. Cantab; 1, The Crescent, Surbiton [Master: Mr. E. W. Mountford*].

Simpson: Claude Herbert; 19, Southbourne Road, Sheffield [Masters: Messrs. Flockton,* Gibbs,* and Flockton*].

Smith: John Barlow; 8, Kent Villas, Alexandra Place, Bedford [Masters: Messrs. C. E. Mallows and Grocock].

Smith: William Collin; 1, Westbourne Park Crescent, Paddington, W. [Philological School, Marylebone Road].

Spencer-Smith: Charles Owen; Palmer Lodge, Palace Street, Westminster, S.W. [Master: Mr. H. Percy Adams*].

Stair: Arthur Cecil; Highcroft, Etchingham Park, Church End, Finchley, N. [Master: Mr. Ernest A. E. Woodrow*].

Stretton: Clement; 2, Mecklenburg Street, Leicester [Master: Mr. Stockdale Harrison*].

Sullivan: Leo Sylvester; 28, Maitland Park Villas, Haverstock Hill, N.W. [Masters: Messrs. Alfred Waterhouse* and Son*].

Symon: Alexander; 7, John Street, Bedford Row [Masters: Messrs. Carver and Symon].

Tod: George Wallace; 19, East Preston Street, Edinburgh [Masters: Messrs. MacGibbon and Ross].

Topley: Samuel Douglas; 57, Granville Park, Lewisham, S.E. [St. Dunstan's College, Catford].

Tyndall: Richard John; 17, Castellain Road, Maida Vale, W. [Master: Mr. A. J. Style*].

Walters: Frederick George; 37, Great Queen Street, Westminster, S.W. [Master: Mr. F. A. Walters*].

Widdup: Percival Sylvester; 171, Preston New Road, Blackburn [Master: Mr. Walter Stirrup].

Williams: Geoffrey Hyde; Longwood Vicarage, Huddersfield [Master: Mr. J. William Cocking].

Yorke: John Vincent; Church Street, Tunstall, Staffs. [Masters: Messrs. Wood and Hutchings*].

THE INTERMEDIATE EXAMINATION.

In Order of Merit.

Byrne: Thomas Joseph [Probationer 1897]; 55, Clarence Street, Kingston-on-Thames [Master: Mr. F. R. Farrow*].

Ewing: James [Probationer 1897]; 70, Church Street, Berwick-upon-Tweed [Masters: Messrs. James Stevenson and Son].

Green: Thomas Frank [Probationer 1893]; 55, Blenheim Terrace, St. John's Wood, N.W. [Master: Mr. Frederick Wheeler*].

Papworth: Alfred Wyatt [Probationer 1897]; 8, Maitland Park Road, N.W. [Master: Mr. F. R. Farrow*].

Holstead: Abraham [Probationer 1897]; 46, Hopwood Lane, Halifax, Yorks. [Master: Mr. Petty].

Mayhew: Robert Henry Jewers [Probationer 1897]; Edmondsbury, Genoa Road, Anerley, S.E. [Masters: Messrs. Roger Smith * and Son*].

Gould: Victor Royle [Probationer 1898]; 10, Hamilton Road, Highbury, N. [Master: Mr. A. W. Hennings*].

Mackenzie: Alexander George Robertson [Probationer 1894]; 61, Queen's Road, Aberdeen [Master: Mr. A. M. Mackenzie, * A.R.S.A.].

Wilson: Henry Armstrong [Probationer 1896]; 20, Broughton Road, South Shields [Master: Mr. C. S. Errington*].

Hemingway: Ralph Eustace [Probationer 1896]; 1, Brunel Terrace, Derby Road, Nottingham [Master: Mr. A. N. Bromley*].

Reilly: Charles Herbert [Probationer 1896]; 23, St. Swithin's Lane, E.C. [Master: Mr. Charles Reilly*].

Spain: John Edward [Probationer 1897]; The Rectory, Rand, Wragby, Lincolnshire [Master: Mr. Wm. Scorer*].

Cockrill: Ralph Scott [Probationer 1896]; Northbury, Great Yarmouth [Master: Mr. J. W. Cockrill*].

Wrinch: Raymond Cyril [Probationer 1896]; Hill Crest, Ipswich [Master: Mr. E. F. Bishopp].

Trew: William George [Probationer 1897]; Tanglin, 232, Dulwich Rise, S.E. [Master: Mr. H. S. Legge* and Son*].

Baird: James [Probationer 1894]; Clyde Villa, Prestwick, Ayrshire, N.B. [Master: Mr. D. V. Wyllie].

Walker: George [Probationer 1897]; Clyde Villa, Old Newbarns, Barrow-in-Furness [Master: Mr. John Butler].

Grace: Lionel Upperton [Probationer 1897]; C/o R. C. Edwards, Esq., 37, Norfolk Street, Strand [Master: Mr. R. Clarke Edwards*].

Norman: George Henry [Probationer 1896]; 24, Palm Street, Old Ford [Master: Mr. J. Henry Ball*].

Smith: Spencer [Probationer 1896]; 29, Lawson Road, Sheffield [Master: Mr. A. F. Watson*].

Banfield: Ernest William [Probationer 1894]; 15, Penford Street, Knatchbull Road, Camberwell, S.E. [Master: Mr. H. L. Florence*].

Bressey: Charles Herbert [Probationer 1896]; 70-71, Bishopsgate Street Within, E.C. [Master: Mr. J. T. Bressey*].

Clifton: Leonard Winton [Probationer 1896]; Atherfield, Clifton Road, Winchester [Master: Mr. T. Stopher].

Hughes: Augustus Edward, jun. [Probationer 1894]; 28, Mortimer Street, Regent Street, W. [Master: Mr. A. E. Hughes*].

Hunter: James Douglas [Probationer 1895]; 10, Pemberton Gardens, St. John's Park, N. [Master: Mr. F. Hammond*].

Joseph: Charles Sampson [Probationer 1892]; 34, Inverness Terrace, W. [Masters: Messrs. Josephs* and Smithem*].

Milburn: William Godfrey [Probationer 1896]; Holywood House, Wimbledon Park, S.W. [Master: Mr. A. J. Gale*].

Pickering: Arthur Edwin [Probationer 1893]; 70, Tressillian Road, Brockley, S.E. [Master: Mr. F. Nesbitt Kemp*].

Pullar: Edgar John [Probationer 1894]; 111, Denmark Hill, S.E. [Master: Mr. Arthur Green*].

Smith: Francis Danby [Probationer 1894]; Saxonhurst, Laurie Park Road, Sydenham, S.E. [Master: Mr. F. J. Smith*].

Tasker: Andrew Kerr [Probationer 1894]; Dunblane House, North Shields [Master: Mr. W. Hope].

White: Horace [Probationer 1896]; Ellesmere, Loughton, Essex [Master: Mr. Edmond Egan*].

THE FINAL EXAMINATION.

Bourne: Walter Hargreaves [Probationer 1895, Student 1897]; 29, West End Lane, West Hampstead, N.W.

Cubbon: John [Probationer 1892, Student 1894]; 2, Cambridge Road, Sale, near Manchester.

Green: Leslie William [Probationer 1891, Student 1897]; Sumptermead, Datchet, Bucks.

Hiorns: Frederick Robert [Probationer 1895, Student 1896]; 2, Moselle Villas, St. Peter's Road, Margate.

Kirkland: John [Probationer 1889, Student 1892]; 6, Aldebert Terrace, Albert Square, S.W.

Knight: Edward Frost [Probationer 1896, Student 1897]; North Bank, Oakleigh Park, N.

Mager: Ernest Jesse [Probationer 1894, Student 1895]; 28, Carlton Road, Tufnell Park, N.

Pearson: Harry Dighton [Probationer 1890, Student 1891]; St. Arvan's Teddington.

Phillips: John Henry Arthur [Probationer 1894, Student 1896]; 110, Cheapside, E.C.

Reavell: George, jun.; Alnwick.

Scott: William Alphonsus [Probationer 1889, Student 1895]; 16, William Street, Drogheda.

Steadman: Vincent [Probationer 1892, Student 1894]; Gifford House, Alma Road, Clifton, Bristol.

Tanner: Henry, jun. [Probationer 1895, Student 1896]; Rothbury, Brackley Road, Beckenham.

Triggs: Harry Inigo [Probationer 1892, Student 1898]; Stafford House, Chiswick, W.

Wager: Jasper; 2, Vanbrugh Hill, Blackheath, S.E.

Watson: Arthur Maryon, B.A. Lond. [Probationer 1889, Student 1894]; 9, Nottingham Place, W.

Views and Reviews.

HARROGATE.

The well-known Yorkshire Spa is not overpraised in two illustrated accounts of its attractions as a health-resort, which the Corporation has just issued. Harrogate, of course, is known to the world chiefly on account of its baths and waters, but the town has also the advantage of being situate within negotiable distance of several places and objects of antiquarian interest. Aldborough, which had some sort of an existence in Roman times, and which now boasts, as relics of its dusty antiquity, tessellated pavements and other Roman curiosities, is not a dozen miles away, and has, as a near neighbour, the town of Boroughbridge, which is interesting to the antiquary and historian chiefly from its connection with Aldborough. Abbeys and halls, castles and crags abound around Harrogate, rendering the town to the architect and antiquary a desirable headquarter for an enjoyable holiday.

"Harrogate as a Health Resort." "An illustrated account of Harrogate, its baths, waters, and environs." Both booklets are published by the Corporation.

MR. HUBERT HERKOMER has given at Florence a studio reception, at which the guests admired the latest paintings of the great artist.

THE DUKE OF NORFOLK has opened the new buildings of the Brighton, Hove, and Sussex Throat and Ear Hospital, a large and lofty square block on Church Hill immediately north of the parish church, and having a clear outlook over the town and the sea. The cost has been about £6000.

By permission of the Marquess and Marchioness of Downshire, a private view was held last week at Downshire House, Belgrave Square of a collection of pictures by Spanish artists, to be sold in connection with a bazaar there in aid of the Spanish wounded and the widows and orphans created by the late war with America. The pictures are some sixty in number, and include works by the best artists of Spain. Included in the exhibition is a pencil study of a head by Mr. Alma Tadema, R.A., which is priced at £63, and "Spanish Dancers," by Mr. J. Sargent, R.A., figured at £600. The original study for the "Secretos de Amor" of Garcia Mencia is hung, as well as a very fine piece of work, "Head of a Girl" by Madrazo, for which £150 is asked. This painting is unfinished, and bears a pencil note and the signature of the artist.

Professional Items.

CONSETT.—The foundation stone of a technical institute has been laid. The estimated cost of the buildings, including the site, furniture, fittings, &c., is about £5000. The contract has been let to Messrs. John Marshall and Sons, of Hawick. The Institute will occupy an eminently suitable site at the north end of the town, facing on to Park Road, one of the chief thoroughfares. The general design of the building is a plain treatment of Renaissance character. The exterior walls are faced with deep red pressed brick and Prudham stone dressings. The principal entrance has a deeply-recessed arched doorway, forming the chief feature in the façade, and leads through a vestibule with handsome stained glass screen into the entrance hall, from which direct access is obtained to the whole of the ground floor rooms. The second floor, which has been specially designed with the view of being adapted for use as Art room, with store room, cloak room, &c., in the future, will be at first utilised as caretaker's apartments.

DUNFERMLINE.—A company was recently formed in Dunfermline with a capital of £5000 for the purpose of erecting a lodging-house in the city. An admirable site has been procured at the corner of Chapel Street and Bruce Street, and a building is to be erected at a cost, including the site, of £4200. The building will accommodate 141 people. Special accommodation is to be provided for females and young children. The architect is Mr. MacLennan, Dunfermline.

GLASGOW.—Messrs. Stewart and M'Donald's new premises, Buchanan Street, Argyll Street, and Mitchell Street, have raised some discussion in consequence of the site on which they are to be erected, standing out prominently in Buchanan Street. The citizens of Glasgow have for years been looking forward to the possibility of Buchanan Street being widened by the setting back of the frontage line at the south end. But this corner happens to be the most valuable one in Glasgow, and has been valued at £130 per yard. There is also the difficulty of the present buildings not being large enough for the business occupying them, the consequence being that the firm had some years ago been compelled to extend into buildings on the west side of Mitchell Street. However, we are informed that the proprietors are willing to sacrifice the portion projecting beyond the adjoining line of Buchanan Street at its value. The architect of the proposed buildings is Mr. Horatio K. Bromhead, A.R.I.B.A. The entire front to Argyll Street is to be taken down and rebuilt fireproof. The wholesale entrance will then be in the centre of the Argyll Street front, and will at once lead to the principal staircase, which will be supplied with two passenger hoists, both communicating with every story of the premises. The additional stories of the new building, with the new stories now being added to the Mitchell Street buildings, will ultimately make a very large increase to the space now occupied by Messrs. Stewart and M'Donald. The new roofs are to be flat and also fireproof, and, when they are supplied with hose pipes, will be able to exercise a very important influence upon any fire, if such were to occur within the range of their commanding position.

LEEDS.—A new Wesleyan church has been opened in Burley. The new church is situated in Cardigan Lane. The premises have been designed by Mr. G. F. Danby, architect, of Leeds, whose design was selected in a limited competition. They comprise a chapel, school room, infants' room, church parlour, ministers' room, and twelve class rooms. The school room and class rooms, which are to have communication with the church, are not yet built, but land is reserved for the same. The style of Architecture adopted is Decorated Gothic. The church is built of stone lined with brick, whilst all the internal woodwork is of pitch pine. The principal doorway has granite

columns with carved capitals and moulded arches, terminating in a gable. Over this is a re-light traceried window. At the south-east corner a handsome tower and spire rise to the height of 110ft. Inside the tower is a stone staircase leading to the gallery, which has three entrances. The chapel is 84ft. long, 18ft. across the nave, and 57ft. across the transepts. There is seating accommodation for 480 persons on the ground floor and 320 in the gallery. The chancel is separated from the chapel by a moulded arch supported on granite columns, with bases and caps of Caen stone richly carved. The chancel is lighted by a circular traceried window, whilst two-girt traceried windows light the transepts. The open-timbered roof rises to a height of 11ft. The premises are heated by the low-pressure hot-water system. Fresh air is admitted to the chapel and various rooms by air-vents and ventilating radiators, the foul air being carried away by roof ventilators and flues. The cost, including site for schools, is £6590, towards which £3800 had been raised previous to the opening services. The work has been carried out by C. Myres, masonry; J. Ledgerd and Son, joiners' work; H. Boston, lumber; Atkinson and Son, slaters; Holmes and Co., warming; and J. F. Ebner, the mosaic tiling.

LUTON.—The Grand Theatre at Luton was opened to the public on Monday. The building has been designed on the latest modern principles. It is a two-tier house constructed on the cantilever system, and there are only two columns upon the pit level and upper circle level to in any way obstruct the view. The whole of the floors are of concrete. There is seating accommodation for about 1000 persons, and standing accommodation for about 50 persons in addition. The proscenium opening is 24ft. by 24ft., and the stage has a total depth of 30ft., with an extreme width of 6ft., with an additional area of 5ft. by 15ft. on the prompt side. The proscenium opening is fitted with a fire-resisting curtain, and the stage with all latest improvements, and with its mechanical appliances is quite up-to-date with the latest requirements. Provision has been made for ten dressing-rooms and a band-room, with all necessary conveniences. Three refreshment bars have been provided, together with all necessary cloak-room and lavatory accommodation. Upon the pit level there are no less than thirteen entrances and exits, including two to the dressing-rooms in case of fire, so that the house could be emptied in a very short space of time, and ample provision has been made for exit staircases. The main entrance will be paved with marble mosaic. The exterior is faced with grey Luton bricks, relieved with quoins and dressings of red bricks, and St. Aldhelm box ground stone for cornice strings, bands, etc., the ornamental detail being carried out entirely in stone; and the exterior has a pleasing effect. The whole of the work has been designed and carried out under the superintendence of Mr. Charles Herbert Shoppee, F.R.I.B.A., of 22, John Street, Bedford Row, London, while the contractor is Mr. W. G. Dunham.

NEWTON ABBOT'S.—At Newton Abbot's a new hospital has just been opened. In the new building twenty-seven patients can be accommodated without any strain on the resources of the hospital. In the new hospital drainage and everything has been carried out in the most perfect manner. The building is about 200ft. long and 48ft. in width. There are two large wards at either end, beautifully lighted. The private wards, board-room, surgery, operating room, &c., are in the centre. Special attention has been devoted to the operating room. Nurses' rooms are on the first floor, an accident room is at the rear, for cases that require only temporary attention, and a separate building is devoted to the out-patient department. Mr. S. Segar, of Newton Abbot, was the architect, and Mr. H. Mills the builder. The furnishing of the hospital, as yet only half complete. A broad winding roadway leads up from East-street to the hospital, close by the severely plain old Baptist chapel, erected in 1697. The cost was £6000.

Under Discussion.

THE EARLY RENAISSANCE SCULPTORS.

At the Leeds School of Art a lecture was recently given by Mr. W. H. Thorp, F.R.I.B.A., on "Early Renaissance Sculptors and Their Work." The lecturer, in his opening remarks, enumerated the early fifteenth century Florentine sculptors, specially mentioning Ghiberti, Donatello, Luca and Andrea della Robbia, Bernardo and Antonio Rossellino, Desiderio da Settignano, and Mino da Fiesoli. A brief sketch was then given of the three great schools of sculpture, the Greek of the time of Pericles, the Early Italian Renaissance of the fifteenth century (treated in the lecture), and the later or culminating period of the Renaissance. The year 1400 was notable in the annals of Art as being the date of the celebrated competition for the Baptistry doors at Florence between Branelleschi and Ghiberti. With the advent of these two artists, sculpture gradually emerged from its mediæval manner, and while retaining much of the devotional and mystical spirit which characterises the earlier work of the period, it burst the bonds of middle age tradition. There was a closer approach to Nature to be observed, a greater sense of proportion, and a feeling of refinement and subtlety which appeared to blend the best elements of Greek Art with the spiritual inwardness which was so marked a feature of early Italian artistic work. The sculpture of this epoch, although in a state of development which culminated in the work of Michael Angelo, was, notwithstanding, in itself perfect within certain limitations. Its perfection lay chiefly in its bas-relief—a system of low relief being relied on by the artists to express their creations in marble, bronze, or terra-cotta. The delicate kind of relief, called by the Italians "Staccato," in which the form often looked drawn rather than chiselled, was excelled in chiefly by Donatello, whose Santa Cecilia might be pointed out as a typical example of this treatment. This element of evanescence and delicate refinement was common also to the statues and effigies which formed so prominent a feature of the tombs met with in the churches of Florence.

R.I.B.A. ELECTIONS.

At a business meeting of the Royal Institute of British Architects, Prof. G. Aitchison in the chair, held on Monday, December 5th, the elections were made:—Fellows: Robert Lockhart McCowat, of Johannesburg; William White Cooper, M.A., Diocesan Architect of Grahamstown, Cape Colony; Henry Thomas Hare (A), Ashpitel Prizeman, 1886, of London; William Henry Duffield (A), of London. Associates: John Cecil Baines, London; Christopher William Surrey, London; Albert Herbert, Leicester; Louis Moore, Woolston, Southampton; Percival Cherry Blow, St. Albans; James Stockdale Harrison, Leicester; Miss Ethel Mary Charles, London; Arthur Reutlinger Gough, Redland; Charles Ridley, Wellingborough; Victor Evans Bisher, St. Leonards-on-Sea; Robert Walter Carden, London; Arthur William Vercos, Lee, S.E.; Alexander Cowie, London; Gerald McMichael, Birmingham. Hon. Associate: Sir Alexander Binnie.

DURHAM CATHEDRAL.

The members of the Northern Architectural Association, at their last meeting, heard a lecture by the Rev. Canon Savage, of South Shields. The subject was Durham Cathedral. The substance of the lecture was not a technical discourse on Architecture, but an historical sketch of the growth of the magnificent cathedral. Canon Savage's introductory remarks were especially interesting. He pointed out that the cathedral was not dumped down on the hill on which it stands, but that it was the outcome of a long heritage of spiritual life—a heritage that began with Iona, and that was developed at Lindisfarne till, within a short period afterwards, the whole of Northumbria became an organised diocese.

In that diocese at first the structures were extremely simple. The huts that were built on Holy Island were, no doubt, after the pattern of the huts some of which still remain in the West of Ireland. For some years wooden buildings only were erected, and then came the introduction of stone buildings by Benedict Biscop, with his Gallic masons, the first stone building being at Monkwearmouth, to be followed shortly afterwards by Jarrow. The Saxon churches had a totally different ground plan from the churches of the Augustine mission in Kent. Those in the North had the nave built in the form of two cubes, with a square presbytery, while those with a round presbytery were found only in the churches of the Gregorian mission. There were many indications of the passing from wood to stone.

SCOTCH GARDENS.

Mr. R. S. Lorimer read a paper before the Edinburgh Architectural Society on the 30th ult. Mr. W. Nicholson Cumming was in the chair. The subject was "Scotch Gardens," and in opening Mr. Lorimer dwelt on the privacy and seclusion of the garden, as a place removed from worldly worry, where one's fancy may blossom with the flowers. Of history there was little to tell beyond reminiscences of the days of Queen Mary, when French influence may be said to have created the taste for the formal pleasure ground. The special charm of Scotch gardens is difficult to describe, but Mr. Lorimer successfully carried his audience through a quaint "plaisance" of old yew hedges, cropped terraces, sun dials, and gay borders. Broad principles were then laid down on such matters as avenues, vistas, the shading off of formality as the park is approached, and Garden Architecture. Mr. Lorimer then showed a number of delightful views from such famous gardens as Balcaskie, Edgell, Wemyss, and Hatton. A hearty vote of thanks was accorded to the lecturer.

MODERN METHODS OF TREATING SEWAGE.

Any observations that Dr. A. Bostock Hill may have to make on the treatment of sewage are certain to be listened to with interest by members of the Institution of Civil Engineers, who heard an address the other day by Dr. Hill on the subject of "Sewage and modern methods of treatment."—Dr. Hill at the outset showed how sewage varied according to the construction of the sewers—whether they were old or modern, whether they received the storm water, or whether they were constructed on the separate system, or whether they received much manufacturing refuse. The variations in quantity also depended largely upon whether the sewage received the storm water. He submitted several analyses of sewage, and then proceeded to deal with his subject historically. He pointed out how the question of the treatment of sewage became important from the time of the appointment of the Rivers Pollution Commission, and went on to show how the old views with reference to the chemical treatment of sewage were false both in theory and practice, and were only maintained in places into which the more advanced views had not penetrated. He dealt at some length with the disposal of sewage by the modern bacteriological methods, affirming that any system which was opposed to the principle on which the bacteria which produced resolution of the sewage depended was false, and must fail. He asserted that one of the main reasons for the failure of purification at Saltley Sewage Farm was the flooding of the land, thus preventing the access of air to the bacteria. Without air, of course, the bacteria died, and without them no purification of the sewage could take place.

THE ARCHBISHOP OF YORK has dedicated the new day schools which have been erected in Royal Avenue Road, Scarborough, in connection with the Church of St. Martin's-on-the-Hill in that town.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BROMLEY (Kent).—For additions, &c., to hospital, Skym Corner, for the Bromley and Beckenham Joint Hospital Board. Mr. John Ladds, architect, 7, Doughty-street, London, W.C. Quantities by Mr. Alfred Boxall, 8, Adam-street, Adelphi, W.C. :—

CONTRACTS OPEN.

HORNSEY URBAN DISTRICT COUNCIL.
TO ROAD AND SEWER CONTRACTORS.

The Hornsey Urban District Council are prepared to receive TENDERS for SEWERING, LEVELLING, PAVING, METALLING, CHANNELLING, and MAKING GOOD, the following ROAD and portion of road, situate within the District of Hornsey, viz:—

1. Temple-road.
2. Rathcoole Gardens (1st section).

Plans and specifications may be seen, and forms of Tender and all information obtained, on application to Mr. E. J. LOVEGROVE, Engineer to the Council, at the Offices mentioned below, on any morning between the hours of TEN and TWELVE o'clock, on a sum of Two Pounds being deposited with the Clerk to the Council, which sum will be retained by the Council and deemed to be forfeited if a bona-fide Tender is not made by the depositor.

If a Tender is made which is not accepted, the sum deposited will be returned, and if a Tender is accepted such sum will be retained by the Council until the contract has been executed by the depositor, and will be forfeited in the event of his or his sureties failing or neglecting to execute such contract, or the bond accompanying same, within seven days after he or they respectively shall have been requested to execute the same.

No Tender will be considered except on the prescribed form.

Sealed and endorsed Tenders are to be deposited in

the Tender box in my department not later than FOUR o'clock p.m. on MONDAY, DECEMBER 19th next.

The Council reserve to themselves the right to decline all, or any, or any portion, of the Tenders so sent in.

By order,

F. D. ASKEY,

Clerk to the District Council.

Offices, Southwood-lane,
Highgate, N.

December 6th, 1898.

EDMONTON SCHOOL BOARD.

TENDERS are invited for the ERECTION of a NEW INFANTS' SCHOOL at Eldon-road, Lower Edmonton.

Persons desirous of Tendering must send in their names to the undersigned not later than NOON, SATURDAY, DECEMBER 10th, 1898, accompanied by

WOOD-BLOCK PAVING.

(MR. WHITE'S SYSTEM.)

For Churches, Schools, Offices, &c.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

BACTERIAL TREATMENT OF SEWAGE.*

By GEORGE THUDICHUM, F.C.S.

ON the last occasion upon which the author had the honour of reading a paper before the Society, he dealt with the principles involved in the successful biological treatment of sewage effluents, more particularly as deduced from the results obtained from the one-acre filter bed at the Northern Outfall at Barking Creek. At the same time he hinted at the advance then being made by the local authorities at Sutton, Surrey, viz., the direct treatment of the actual sewage by the same agencies, but under conditions, as regards bed material chiefly, necessarily somewhat altered. The progress in this direction has since that time been remarkable, and very many authorities, all over the kingdom, have followed in the footsteps of the Sutton Council by adopting their method in its entirety. It is not the intention of the author, on the present occasion to deal with the question from

ITS SCIENTIFIC OR THEORETICAL ASPECT; this has lately been fully discussed upon many occasions. It is rather sought to bring before the notice of the members of the society the practical outcome of a large amount of experimental work, and to show how the system can be adapted to meet local requirements in various cases; it being now evident that the general principal of biological treatment, in one form or another, is acknowledged by the majority of those practically concerned in the disposal of waste matters. The author has also no intention of entering into matters of history, claims as to priority of ideas, or even as to the relative merits of the various schemes suggested, except with regard to those two systems which are at present most prominently before the public. During the last eighteen months the author, together with his partner, Mr. W. J. Dibdin, formerly chief of the chemical and gas department of the London County Council, has had numerous opportunities of applying in practice the principles learned during many years of experiment; and it is the general result of such practical experience, illustrated

BY CERTAIN CONCRETE EXAMPLES,

that he now proposes to lay before the Society. In addition to dealing with this matter as applied to larger communities, he also proposes to discuss the question of the treatment of the sewage of isolated country houses, workhouses, schools, asylums or other public institutions; a question which, more especially latterly, has become of the greatest importance. In attempting to apply the biological method to the treatment of the sewage of any given place, three questions of paramount importance have to be considered; these are (1) the available fall; (2) the nature of the soil; and (3) the possibility of the sewage containing ingredients which are hostile to microbial life. The first two questions, those of fall and nature of soil, will in great measure determine, according to the author's views, the method to be adopted in the particular case. In gravitation schemes in which the sewage is delivered at less than 4ft. above the point at which it must be finally discharged, it would appear that the septic or Exeter method possesses some advantages, in that a fall is required into and out of one set of bacteria beds only, no head being lost by passage through the septic tank in which the preliminary solution of the solid matter is effected. It must be understood that in discussing arguments of this kind the author is not siding with the septic tank against the Sutton, nor with the Sutton against the septic tank system. He desires merely to point out what are the particular advantages of either according to the local conditions, and the final results produced by either process are in all respects comparable. If the sewage be naturally delivered at a point very near the level of the final outfall it must then be quite evident that

a system requiring a fall through one bacteria bed only has an advantage from an economic point of view over a scheme which necessitates a fall through two beds. If, however, the sewage must in any case be pumped, or is delivered by gravitation at a height above the outfall sufficient to allow of the interposition of two sets of bacteria beds, it then becomes a matter for consideration as to which of the two should be adopted; and the decision, it appears likely, will usually be arrived at from economic reasons mainly, if not entirely. The extent of fine-grain bed to be provided will be the same in either case; the difference, therefore, so far as the first cost is concerned, will be the

DIFFERENCE BETWEEN THE COST

of a coarse-grain bacteria bed and of a septic tank. Where the soil is light and porous, so that all tanks and beds must be built of brick-work on concrete bottoms, it is possible that such difference may be extremely small, since the extra cost of covering the septic tank will be compensated by its being of smaller cubic contents than bacteria beds to do the same work, and by its requiring no bed material. Where, however, the nature of the soil is such as to permit of the construction of bacteria beds in the open ground, merely puddling the bottom and sides, the advantage from a pecuniary point of view is entirely with the system adopted at Sutton. On suitable land, such as the heavy clay at Sutton itself, bacteria beds can be made by merely excavating, burning the soil, laying drains on the bottom, and returning the burnt ballast; and this has actually been done at a cost, for a bed 3ft. in depth, of 4d. per foot super, or £726 per acre. In places where the bacteria beds must be erected above the ground level, but where clay is readily obtainable, such beds can be prepared at a relatively small cost; and in these instances also the

FIRST INSTALLATION WILL COST LESS

on the Sutton than on the septic system. With regard to the third point, that of the sewage possibly containing matters hostile to the growth of microbes, the author has found, as a matter of experience, that the majority of trade effluents, especially if diluted with a reasonable proportion of ordinary domestic sewage, will yield to the influence of either aerobic or anaerobic organisms. In a joint paper by Mr. Dibdin and the author, read before the Society of Chemical Industry in April, 1897, this question was specially discussed; and it was shown that bacterial treatment was applicable to sewage containing considerable quantities of refuse liquors from many trades, including, as in the case of Leeds, effluents from tanneries, galvanising works, copper works (wet process), and the solid matters from shoddy; in the case of Maidstone, from tanneries and breweries; at West Bromwich, pickle liquor from galvanising works; at Yeovil, from the yards of fell-mongers and leather dressers; and in various instances in which the sewage to be treated was highly charged with refuse from gas-works, margarine factories, dairies, and distilleries. Taken as a whole, the experience of the last two years goes to prove that in the large majority of cases the manufacturing refuse which may be present in the sewage does not prevent the application of the

PRINCIPLES OF BIOLOGICAL TREATMENT

throughout; whilst in cases in which preliminary precipitation or other treatment is necessary, the final purification can be best effected by means of the fine bacteria bed, as described by the author in his paper read before the Society in 1896. Turning to a concrete example of the advantages possessed by a bacterial process as compared with chemical precipitation and land treatment, the author would point to the Worcester Park outfall works of the Cheam and Cuddington Council, in the area administered by the Epsom Rural District Council. This is one of those cases, alluded to by the author in his previous communication, in which the successful working of the farm is rendered practically impossible by the very nature of the soil, which is a heavy clay, waterlogged in wet seasons, and

in dry ones full of cracks which admit of the direct passage of the sewage effluent to the underdrains, whence it escapes, unpurified, into the brook. But it is just in such a soil that aerobic bacterial treatment can be adopted in the most economical manner possible. The daily quantity of sewage delivered at the Worcester Park Farm is about 80,000 gallons, the high-level sewage containing considerable quantities of brewery refuse, the low-level being ordinary domestic sewage. The high-level delivers by gravitation near the highest point of the farm, whilst the low-level, entering at the bottom, is pumped to precipitation tanks about the centre of the area. Two small artificial filters were also provided. The effluent produced was very bad, and the general condition of the farm unsatisfactory. It was accordingly determined to establish coarse and fine bacteria beds on the Sutton method; both sets, since the fall was sufficient, to be excavated; and the bed material to be burnt ballast obtained on the farm itself. Pending the carrying out of these alterations, it was necessary to deal by some temporary means with the high-level sewage, which was responsible for the larger proportion of the effluent complained of. The method adopted for effecting this purpose is highly instructive, as showing the

IDENTITY OF LAND TREATMENT

with so-called bacterial treatment, and at the same time demonstrating the reason for the superiority of the artificial over the natural method of rendering microbial life available for this purpose. A plot of land of about an acre in area having been selected, the main effluent drain was locked, and the sewage (which in order to reach the highest portion had to be backed up in the outfall sewer) was allowed to flow on to the land until no more could be received; in fact, the whole plot was considered and treated as a Sutton bacteria bed. This operation occupied about three days. At the expiration of this period the damming of the outfall sewer was stopped, and the sewage allowed to flow freely for a short time into the precipitation tanks, in order to remove any accumulation of sludge from the sewer; the backing up was repeated, and the sewage diverted on to a second plot treated in a similar manner to the first. The valve locking the latter was opened, and the water gradually discharged from the plot. The work was continued in this way, using the plots alternately, and the result was a remarkable

IMPROVEMENT IN THE QUALITY OF THE EFFLUENT.

That which before was black and stinking was clear and had only a slight sewage odour, analysis bearing out the conclusions arrived at from inspection by sight and smell. Such an operation must of course not be looked upon as a typical bacterial treatment. The time occupied in filling the bed and consequently the period during which the organisms are submerged is far too long; whilst the bed material is so fine that the re-entry of air is necessarily imperfect, and choking of the surface by the suspended matters in the raw sewage would take place probably at an early date. But as an object lesson it is worthy of the most careful consideration. By compelling the intimate contact of the sewage matters with the purifying bacteria, and by ensuring that such contact should be of some duration, work was effected, which under the original conditions was impossible. The

ACTION OF THE ORGANISMS

existing in the soil was controlled, as in an artificial bed; and the desired result was arrived at with practically no expenditure whatever. But, as just pointed out, such a method, however admirable as a temporary expedient, could not be looked on as a radical cure; since the fineness of the bed material and its softness would infallibly cause a break down in the course of time. The bed material must be of a size sufficient to admit the passage, in the case of the coarse beds, of the suspended particles in the sewage; and in both sets of beds of the free admission of atmospheric air as the water is withdrawn. It must also be of a more or less hard and resistant nature in

* A paper read before the Society of Engineers on Dec. 5th, 1898.

order that it may retain its original size and shape, and not break down into a mud. To provide, therefore, for the

PERMANENT TREATMENT OF THE SEWAGE

coarse-grain beds, having a united area of 4500 superficial feet and a depth of 3ft., were designed, the bed material to be burnt ballast, the whole of which had been rejected by a screen having a half-inch mesh; and a similar number of fine beds, with a united area of 4950 superficial feet and a depth of 3ft., the bed material being also burnt ballast, but in this case of a size which would pass a screen having a half-inch mesh, the fine dust only being rejected. The beds were constructed by excavating, puddling the bottoms and sides, and laying agricultural drains on the bottom, leading to an outlet controlled by a valve. The cost of the beds, to deal with a dry weather flow of 80,000 gallons daily, amounts to £325 only. The result of the work is what was anticipated, namely, the production of a perfectly satisfactory effluent. A similar method will be found generally applicable on a large number of sewage farms which are at present yielding unsatisfactory results, and it is this facility that constitutes one great advantage of the Sutton system. Existing precipitation tanks can be utilised, in small part as sand traps, in the greater part as coarse beds, being converted into the latter by the simplest form of drainage being laid on the floors, and by being then filled with burnt ballast, coke, or whatever material can be readily provided in the neighbourhood. Fine beds can then be constructed as indicated, and the effluent from these can be

PASSED ON TO THE LAND

when desired, or may be discharged directly into a watercourse when the condition of the crops or the soil renders irrigation useless or harmful. The immediate benefits derived from such a conversion of the method of treatment are well marked; the use of chemicals is abandoned, saving cost of both materials and labour. The collection and subsequent treatment of sludge is abolished, since there is no sludge, merely a small quantity of rags, paper, and similar matters collected by the screens, and amounting in ordinary cases to about thirty barrow loads per million gallons, the sludge item also making a marked difference in the working cost. There is at no time danger of nuisance arising from the works, such as is necessarily the case when sludge has to be dealt with and an effluent liable to secondary putrefactive decomposition is spread over the land; and, lastly, the crops can receive the full benefits of the manurial constituents of the sewage at such times as irrigation is wise or needful, without being drowned, and compelled to grow in sodden soil by its being always necessary to pass the effluent through the land. The Sutton works themselves form a typical instance of the advantage of conversion. By the time the alterations are completed, the whole cost will have been less than £2000, whilst the annual saving in working expenses already or to be effected amounts to no less than £500, or about 8d. per head of population.

(To be continued.)

MR. WALTER A. DUCAT, an inspector of the Local Government Board, opened a public inquiry at Milnthorpe, in relation to a new sewerage scheme promoted by the Rural District Council of South Westmoreland, who have applied to the Local Government Board for sanction to borrow £1250 to carry out the project.

The Finance Committee of the Whitechapel District Board have brought up a report in which they recommend that the Board shall make application to the London County Council for the borrowing of £25,000 for the purchase of a site as a generating station in Osborne Street, Whitechapel. This property is adjacent to the Board's destructor premises, and they hope to utilize the waste heat for the generation of the current. Among the streets to be first lighted will be the Whitechapel Road, Lemon Street, Commercial Road, and Commercial Street.

Surveying and Sanitary Notes.

At an important meeting of the Waterworks Committee of the Llanelli Borough Council it was decided to push forward the construction of a second storage reservoir, arrangements having been made with all the landowners for the purchase of the necessary land, with one exception. The proposed reservoir will be constructed above the present one at Cwmlledi, and will have a capacity of 180 million gallons. The plans were produced and approved, and the account of the arbitrator, amounting to 120 guineas, was ordered to be paid in full. It was further decided to instruct the Finance Committee to arrange for a loan for the money required.

GIBRALTAR can now boast of a system of drainage second to none in our Colonies. The advantages of a really effective sewerage scheme cannot be over-estimated in a fortress like this, where a large garrison of soldiers and sailors, whose health is of prime importance, is stationed. The new sewer has involved an immense amount of labour and skill during the two years or so of its construction. It is of solid concrete and high enough for a man to walk erect through its entire length of two miles from the north end of the town to the southern outlet at Europa Point, where all the matter is carried away into the waters of the Mediterranean. The pumping engines and machinery are fine specimens of British handiwork from the firms of Crossley (Manchester) and Schonn (London) respectively, and are situated at the north end of the garrison. By means of a tank of large capacity, fitted with flood gates, some hundreds of tons of water are discharged with tremendous force through the sewer at each flushing, which is carried to the sea outlet in five minutes. It now remains for the Sanitary Commissioners to see that the catch-pits and connections from the houses to the sewer are kept clean, and then, doubtless, all the bad odours for which "Gib." has been noted in past years in her streets will be a thing of the past, together with the periodical outbreaks of fever that must have increased the death-rate, which should be very low in such a mild climate. The attractiveness of the place will sure to be increased as a health resort thereby.

THE Royal Commission on the London water question sat again on Tuesday of last week, Lord Llandaff in the chair, Mr. Middleton, C.E., was again under examination. The rainfall was, he said, much more in the Welsh area, from which it was proposed to take water for the supply of London, than it was in the Thames district; but, on the other hand, the watershed in the Thames area was greater than that of the Welsh. It was his opinion that the Welsh scheme would not be profitable for a very long time to come, as the initial outlay would be so very great. He was of opinion that the Thames scheme would become profitable in a very much shorter period.—A Commissioner pointed out that the witness had the previous day stated that some time or another it would probably be necessary to go to Wales for water.—Witness replied that he had put that at a great many years hence. London would have to be a city never heard of before it would be necessary to go to Wales for water supply.—The Chairman: But London is a city never heard of before.—Witness maintained that it would not be necessary to go to Wales for many years, and until London had grown considerably larger than it was at the present time, with a much larger population and a much more widely extended area. He estimated the capital cost of the Welsh scheme for a supply of 123½ million gallons a day would be 20½ million pounds; for 135 million gallons a day £22,327,800; for 172 million gallons a day £27,803,467, and for 215 million gallons a day £32,789,310. He had based his estimate on three schemes that had already been carried out, and which gave an average distance of

conduit of 81 miles. This had been constructed at a cost of £91,611 per million gallons of supply. The total length of conduit which would be required for the Welsh supply to London would be 162 miles, and for the additional 81 miles he had reckoned the cost at so much per mile, namely, £64,000 a mile.—The Commission again adjourned.

SANITARY BUILDING CONSTRUCTION EXAMINATIONS.

THE Worshipful Company of Carpenters have held their annual examination on Sanitary Building, Construction in their hall in London Wall during the last fortnight, when the number of candidates entering exceeded that of the two or three previous years. Entries were received from the provinces as well as from the district of Greater London. That the Company insist on a high standard being reached by their certificate-holders is evidenced by the strong board of examiners who have kindly helped them in their work. The examiners are:—Prof. A. Wynter Blyth, Prof. Banister Fletcher, F.R.I.B.A., Prof. Henry Robinson, M.Inst.C.E., Prof. T. Roger Smith, F.R.I.B.A., Mr. J. Howard Colls, Mr. Stanton William Preston, the President of the Royal Institute of British Architects, the President of the Architectural Association, the President of the Institute of Builders, and the President of the Clerk of Works Association. We understand that the Company lay special stress on the practical nature of this examination, as well as on their examination in carpentry, &c. in the summer. All candidates are brought face to face with the actual objects met with in building, and no man who is not, or has not been, a practical man, can obtain the certificate. There has been a short course of lectures, delivered by Prof. Banister Fletcher and Prof. T. Roger Smith, as a preliminary to this examination, and this course has been very well attended by candidates and intending candidates. The following is a list of the successful candidates in order of merit:—Gold Medal—Mr. T. Cherrill Way. Silver Medals—Messrs. F. Hartnoll, H. C. Remnant, Jno. Sanderson. Bronze Medals—Messrs. E. F. Brown, T. E. Kinch. Certificates—A. Harrington, W. H. Masters, J. G. Anderson, C. R. Tinson, L. Bate, A. Norton, W. J. Andrew, S. W. Hayward, A. C. H. Pendlebury, C. R. Fenn, T. R. Tanner, Geo. Gout. The Duke of Fife, K.T., has consented to distribute the prizes and certificates, etc., won at this and at the Carpentry Examination in June last, and also to the students in the Trades Training School, at Carpenters' Hall on the 22nd inst.

AN institute, erected for the purposes of education and recreation in Tooley Street, E.C., at a cost of £12,000, in connection with the united charities of St. Olave's and St. John's, Southwark, has just been opened. Mr. Henry Stock, F.R.I.B.A., is the architect, and the Duke was conducted over the institute.

The last meeting of the Glasgow Technical College Architectural Craftsman's Society was held on the 2nd December. The paper for the evening was by Mr. David B. Dobson, whose subject was "Calculations Simplified," as applied to building structures generally. The lecturer treated his subject under the three following heads:—Reactions, bending moments, moments of resistance, mathematics in brief; wood beams, cast iron beams, rolled iron beams, steel beams; wood struts and cast iron columns, and went over the formulæ in a simple and comprehensive manner. He illustrated his remarks by going over examples of each on the blackboard. He gave new formulæ for rolled iron and steel beams and wood streets, which, when worked out, compared very favourably with the older and more complicated formulæ. A new one was also given for cast iron columns which was very simple and easy to understand, a thing that could not be said of the usual formulæ given by Rivington and other text-books. It is one that should prove valuable to all members of the society.

VENTILATION.

By W. N. TWELVETREES, M.I.M.E., M.S.I.

(IV.—Continued from page cxl)

A WELL-KNOWN primitive mode of ventilation consisted simply in making a hole at the top of a room, tent, or other dwelling through which smoke and heated air might escape. Fresh air had to enter by any convenient, or inconvenient apertures, and the result was naturally eminently unsatisfactory. In such an arrangement as this (Fig. 15), air, on entering, would travel towards the fire or

FIG. 16.

other source of heat, and after creating a draught would rise vertically towards the outlet without ventilating those parts of the room out of the track of the ascending current.

This system, with some modifications, is still adopted by uncivilised nations, and in many of our churches and chapels.

One variation of the early method consists in placing the hot air inlet or source of heat at one end of the room and the outlet in or near the ceiling, at the other end. This is an ingenious but futile endeavour to circumvent the laws of Nature and it is presumably intended that the warmed air shall be drawn to all parts of the room. In effect, however, the warm air ascends more or less vertically on leaving the inlet, and travels along the ceiling to the outlet, leaving the remainder of the space unventilated. The dotted line (A B) represents the ordinary level of respiration.

In order to secure the better dispersion of warmed air, the arrangement depicted in Fig. 16 is often used. The inlet or source of heat is at one end and the outlet at the other end, but situated near the floor line. In virtue of its warmth the air rises to the ceiling, over which it spreads, and is drawn downward by the outlet, connected with an exhaust shaft of sufficient power. This method has the effect of securing more equal distribution of the warmed air but the entire space is not absolutely covered, nor is the line of respiration (A B) influenced by the currents except at its extremes. During the summer season, the air admitted, not having been previously warmed, is frequently of lower temperature than the inside air, which may have absorbed heat given off from the occupants of the room, or may have otherwise received a degree of warmth. To provide for ventilation under such circumstances modifications become necessary. Air enters as before and being heavier than the internal air spreads over the floor, from which it is drawn upward by the action of an alternative outlet near the ceiling and in communication with the exhaust shaft. The winter and summer outlets are of course constructed so that either of them can be opened or closed as circumstances may require.

For the purpose of ensuring the complete diffusion of fresh air to all parts of the room, an entirely different arrangement must be adopted. This is indicated by Fig. 17, where the warm air inlet is near the top of the room and the outlet at the bottom. It may be thought perhaps that there will be a tendency for the incoming air to make a short circuit towards the outlet, but

experiment and practice both prove that no fear of any such result need be entertained. The warm air on entering tends to rise and is

FIG. 18.

thus spread all over the ceiling; it gradually displaces the whole of the other air and when cooled, is naturally found near the floor line from whence it may be readily drawn off by the aid of an efficient exhaust shaft.

Apart from the fact that more equal distribution is secured, other advantages are derived from the position of air inlets at the top rather than at the bottom of a room. If situated at the bottom they are extremely likely to act as receptacles for the collection of dust, and to become incubators for the reproduction of micro-organisms deposited from the air. Air inlets in this position also form mouthpieces from which such unnecessary objects are wafted into the room. When, on the other hand, the inlets are near the ceiling, the

general tendency of air currents produced is identical with that indicated to falling particles by the force of gravity.

Considerable divergence of opinion exists as to the merits of various systems for the admission and withdrawal of air. There is, however, no doubt that when other conditions are favourable, the adoption of such a principle as that indicated by Fig. 16 is likely to yield the most satisfactory results. Its details may be varied and elaborated so as to suit all the requirements of large or small buildings,

FIG. 17.

and alternative arrangements may be provided for both winter and summer use.

Due attention must, of course, in every case, be paid to the proper distribution and area of air inlets, so as to prevent the creation of draughts, and when artificial heat is required the air should be warmed, if possible, before admission.

Trade and Craft.

JARRAHDALE JARRAH.

The Jarrahdale Jarrah Forests and Railways Limited have executed an order from a London vestry for 1,773,000ft. of Jarrahdale Jarrah, of which not one plank was rejected. The fact brings out in relief the care exercised in the selection and manufacture of the well-known paving material. Jarrahdale Jarrah, besides being a proved paving material, is well adapted for other work, such as sleepers, piles, docking, platforms, fencing posts, palings, &c. It has an excellent reputation both in London and the provinces, and is frequently specified exclusively. Shipments are often taken up long before arrival.

A HISTORIC POTTERY BUSINESS.

Doulton's, the historic Lambeth pottery business, is to be floated as a limited company, the recent death of Sir Henry Doulton having involved the withdrawal of capital. The headquarters of the business are at Lambeth, but there are factories at Rowley Regis, the largest of their kind in the world, with works at Burslem, St. Helens, Birmingham, Paris, and elsewhere, all of which will be taken over by the new company. The directorate will consist of Mr. Henry Doulton, who has been a partner for seventeen years, Mr. Ronald Doulton, who has been engaged in the business for a quarter of a century, and two others. We believe, our contemporary continues, that the capital of the new company will be £1,100,000, divided into £350,000 first mortgage irredeemable four per cent. debenture stock, £350,000 five per cent. cumulative preference shares, and £400,000 ordinary shares, the shares being of the denomination of £1 each. The tangible assets to be acquired by the company, exclusive of goodwill, are valued at £1,063,000, and the purchase-price fixed by Mr. Henry Doulton for the whole of the business is £1,100,000, payable by the transfer of the whole of the ordinary shares, a third each of the preference shares and debentures, and £466,668 in cash. Thus only debentures and preference shares will be offered to the public. The profits of the business for the past four have been progressive, and have averaged more than £67,000.

THE UNITED ASBESTOS COMPANY LIMITED.

The United Asbestos patent decorations are gaining ground. We have become on very friendly terms with the non-inflammable "Salamander" panels and friezes, and our growing familiarity breeds, not contempt, but increased admiration. With the development of popular æsthetic taste, and the increasing demand for fireproof material in building construction, there can be no

doubt that the United Asbestos Company's novel and artistic covering for walls and ceilings will come more and more to the front. The material has been tested and not found wanting. This, together with its decorative possibilities—or rather achievements—are the potent factors in the success of "Salamander" decorations, which have now been introduced into British war vessels. The recently-launched second-class cruiser "Hyacinth" is up-to-date in this respect. Instead of the usual wood panelling in the cabins, the steel bulkheads are panelled with ornamental asbestos covering, so that not only is a decorative effect comparable to that of the best moulded plaster work and woodwork produced, but the fire risk is reduced to a minimum. One of the most notable tests to which the fire-resisting capabilities of asbestos decorations have been subjected was at the Burlington Restaurant and Hotel, Dublin. The fire originated in the kitchen under the buffet, into which it speedily passed and played with tremendous heat—so the expert report informs us—on the "Salamander" ceiling. This ceiling arrested the progress of the fire, which, the same expert says, must have passed into the upper regions of the building before the fire brigade arrived but for the check. When the ceiling came to be examined, it was found to be practically uninjured by the fire, although torn by the large quantities of water thrown upon the floor above. As we have already mentioned, the United Asbestos Company has recently issued a reduced scale of prices.

THE determination to have fireproof wood is likely to create almost a new industry, which will undoubtedly result in a much more extensive use of the fire-resisting material in buildings and all kinds of structures, so that some facts regarding the process adopted may not be without interest. It is akin to the procedure in creosoting wood, the timber being treated in an airtight cylinder, into which there is first pumped air charged with aqueous vapour of high temperature until the pores of the wood are opened, when the moisture is evaporated by creating a vacuum of 20 to 28in. in the cylinder. The wood is then ready to absorb the solution of phosphate of ammonia and sulphate of ammonia, with other chemicals, which is pumped into the cylinder, and gives the wood its fireproof quality when it has been thoroughly dried in a kiln at 125deg. Fahrenheit. The treatment largely depends upon the original nature of the timber. The cost in America in connection with the latest naval ships is about £10 per 1000ft. of timber. The result is to darken the colour of the wood, and there is said to be a reduction in transverse strength to the extent of from 2½ to 12½ per cent in Oregon pine and yellow pine, but white wood showed an increase of 7 per cent. in strength. All

woods, however, lose in compressible strength to the extent of from 6½ to 9 per cent. In tension there is also a loss of from 19½ to 24 per cent., so that it would be well in determining sizes to withstand given weights to have independent tests. Again, the wood is heavier, much harler to work, and it is said that in some cases it involves corrosion and also injury to clothes which are kept in contact with it.

A BUILDING has been completed for the Govan Y.M.C.A. The new Institute has a frontage to Water Row on one side and to Manse Lane on the other. The style of the building is late English Renaissance, with centre oriels of three lights resting upon an arch over the main entrance fronting Water Row. This arch is supported by fluted pilasters, one on each side, and mounted by a memorial tablet with inscription. The oriels are surmounted by a tower with flagstaff, and on each side of the main entrance on the ground floor are handsome shops, with basement or cellarage. The building consists of four stories, with dormers or attics.

Enquiry Department.

THE SURVEYORS' INSTITUTION EXAMS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I should be much obliged if, through the medium of your Enquiry Department, you could inform me of a text book which would cover the legal subjects in the P.A.S.I. Exam. of the Surveyors' Institution (Building Section). I should prefer a single book to cover the whole if possible, and oblige,

Dorchester. "OGEE."

If you intend to take part in any of these examinations you should procure "Rules of Examination," free, and "Revised Syllabus of Subjects, Papers Set, etc.," price 1s. 6d., from the Secretary, Surveyors' Institution, Savoy Street, Victoria Embankment, London, W.C. The books recommended for the respective law subjects in the Professional Associates' Examination, "Sub-Division III., chiefly Building," are as follows. The examiners point out, however, that the examination is on the subject, not on the text books, and the books recommended are only mentioned by way of suggestion to students:—Law of Fixtures: Amos and Ferard's "Law of Fixtures," 1883; A. Brown "On Fixtures," 1881; Castle "On Rating." Law of Dilapidations: Gibbons "On Dilapidations;" Grady "On Fixtures and Dilapidations." Law of Easements: "Innes' "Digest of the English Law of Easements;" Latham's "Law of Window Lights."

Property and Land Sales.

PERIODICAL SALES.

ESTABLISHED 1843.

MESSRS. H. E. FOSTER & CRANFIELD (successors to Marsh, Miller, and Co.) conduct PERIODICAL SALES of

REVERSIONS (Absolute and Contingent),
LIFE INTERESTS and ANNUITIES,
LIFE POLICIES,
Shares and Debentures,
Mortgage Debts and Bonds, and
Kindred Interests.

the FIRST and THIRD THURSDAYS in each month throughout the year, at the MART, Tokenhouse-yard, E.C. Remaining date for 1898:—
December 15th.

The following are the appointments fixed for 1899:—

January 5th	May 4th	September 7th
February 19th	May 18th	September 21st
February 2nd	June 1st	October 5th
February 16th	June 15th	October 19th
March 2nd	July 6th	November 2nd
March 16th	July 20th	November 16th
April 6th	August 3rd	December 7th
April 20th	August 17th	December 21st

Offices, 6, Poultry, London, E.C. Telephone No. 999

ARMIL PARK, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

MESSRS. DRIVER and CO. have received instructions to offer to AUCTION at the MART, Tokenhouse-yard, Lothbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairlie Station, and about a mile and a half from Cobham. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern." Particulars and plans, when ready, can be obtained of CHARLES JUPP, Esq., Solicitor, 48, Lime-street, E.C.; and of Messrs. DRIVER and Co., 23, Pall Mall, S.W.

SURREY.—Choice BUILDING ESTATE. In a charming district, two miles from Horley Station (L.B. and S.C. Rly.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church. FOR SALE, a compact and valuable FREEHOLD PROPERTY of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Prettily timbered. Gas and water mains along the frontage. Would be divided.

Plans and full particulars of the owner's agents, Messrs. GREEN and SMES, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W.; or Mr. W. M. LEACH, Auctioneer and Estate Agent, Crawley, Sussex.

MIDLANDS.—For immediate DISPOSAL, in a very prosperous and growing town, a First-class BUILDER'S BUSINESS, with good town and country connection. Stock and plant estimated at £1000, all good stock. Fifty hands regularly employed. Works open for inspection and satisfactory reasons for disposal.—For further particulars apply J. H. HEWES, Loughborough.

R.I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Reading Library. Special three months' finishing courses.—For full particulars apply to Mr. W. MURCH HOWGATE, A.R.I.B.A., Perchard House, Gower-street, W.C. (close to the British Museum).

MANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified each," 31, Herbert-road, Plumstead, S.E.

R.I.B.A. SOCIETY OF ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, personally.—MIDDLETON and CARDEN, 19, Craven-street, Strand, W.C.

PLANS, SPECIFICATIONS, QUANTITIES, &c., carefully prepared by young Architect. Moderate terms to those about to build.—ARTISTIC, 1, 1st-terrace, Whitby.

NO ART STUDENTS.—A TRAVELLING STUDENTSHIP of £50 is OFFERED by the INTER-ARTS COMPANY for the encouragement of the study of Decoration. The Studentship is open to competition by students between the ages of 20 and 35 any recognised School of Art or other Institution entered to the study of applied Art in any form, and rate within the limit of the larger metropolitan postal area.—For particulars apply to the "Clerks," Painters' Hall, 9, Little Trinity-lane, E.C.

WANTED, SITE for Engineering Works, in or near Pimlico; area not less than 8,000 sq. feet.—"X," care of Judd's, 5, Queen Victoria-street, E.C.

ASSOCIATION OF DESIGNERS.

DESIGNS, WORKING DRAWINGS, PERSPECTIVES, ARCHITECTS, DECORATORS, & BUILDERS ASSISTED. INTERNAL DECORATIONS EXECUTED IN ALL STYLES.

ITALIAN. FLEMISH. GEORGIAN.
FRENCH. ENGLISH. ADAMS.

Offices: 20, JOHN STREET, ADELPHI, W.C.

CONTRACTS OPEN.

PARISH of NOTTINGHAM.
ERECTION OF NEW WORKHOUSE.
AMENDED SPECIFICATION.

Persons desirous of TENDERING for the ERECTION of the SUPERSTRUCTURE of the NEW WORKHOUSE for the Guardians of the Parish of Nottingham, are requested to forward their names and addresses and a cheque for £20 to me, the undersigned, on receipt of which full particulars will be forwarded.

It is a condition of contract that the person whose Tender is accepted must pay the local standard rate of wages to the workmen employed by him. There are no other restrictive clauses.

Plans may be inspected during ordinary business hours at the Office of the Architect, Mr. ARTHUR MARSHALL, A.R.I.B.A., King-street, Nottingham.

The cheques will be returned on receipt of bona-fide Tenders.

Tenders must be delivered to me by JANUARY 3rd, 1899.

By order of the Guardians,
G. MUNCASTER HOWARD,
November 29th, 1898. Clerk to the Board.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

WANTED, a thoroughly qualified ARCHITECT'S ASSISTANT. Must be able to help with quantities. Salary not exceeding £3 3s.—Reply, stating experience, forwarding specimens of work, to ARCHITECT, 102, Westborough, Scarborough.

TRACING and TYPE-WRITING.—VACANCIES for pupils in well-established Office, Gentlewomen only.—Box 853, BUILDERS' JOURNAL Office.

MANCHESTER ARCHITECTURAL ARTIST requires a JUNIOR ASSISTANT. Progressive salary. Excellent opening for a man with a knowledge of architectural perspective and of real artistic ability.—Apply, with specimens, to PERSPECTIVE, care of W. J. Cummins, 7, Barrett-street, Old Trafford, Manchester.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION of DRAWINGS at his own office.
G. SCORER, 28, Newman-street, W.

ARCHITECT'S General ASSISTANT DISENGAGED Jan. 1st. Competent in office routine, surveying, and levelling, &c. Salary, £2 weekly.—Apply to NAGROM, 80, Harwood-road, Fulham, S.W.

ASSISTANT, three years with Architect and Builder, fourteen years on large Estate, open to RE-ENGAGEMENT at Christmas; used to Draughtsman's work, superintending building, paying estate wages, receiving all rents; excellent testimonials.—"County," BUILDERS' JOURNAL Office.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C.

AGENCIES WANTED by an old-established Firm of Iron and Builders' Merchants in a large district.—Apply Box 900, Office of the BUILDERS' JOURNAL.

TWO GENTLEMEN, with London offices, calling on architects and surveyors, are desirous of representing a first-class Sanitary Goods Manufacturer.—Reply, in first instance, to Box 910, Office of the BUILDERS' JOURNAL.

ADVERTISER requires ENGAGEMENT as JUNIOR ASSISTANT. Neat draughtsman, colourist, and tracer; able to make small surveys, &c.; moderate salary.—Apply, Box No. 914, Office of BUILDERS' JOURNAL.

BUILDER'S CLERK and GENERAL ASSISTANT requires SITUATION. Thorough practical knowledge of the trade. Aged 26. Good references.—Apply J. MASON, 25, Western-street, Bedford.

WANTED immediately, CLERK for Slating Department. Must be well up in all building materials. Capable of taking charge of correspondence.—Apply, stating salary required, GIBBS BROTHERS, Builders' Merchants, Loughborough.

ARCHITECT'S JUNIOR ASSISTANT (21) seeks ENGAGEMENT. Neat draughtsman, working drawings, details, specifications and surveys. Good references.—DENNER, care of Warren, Architect, Exeter.

BUILDER'S ASSISTANT or MANAGER (23) seeks ENGAGEMENT, to supervise buildings and general routine. Abstainer. Highest references.—Address, Box 913, BUILDERS' JOURNAL Office. 1

YOUNG MAN (20) desires ENGAGEMENT in Surveyor's or Architect's office, in London or S.W. suburbs, as Shorthand Clerk and Typist, and to assist with professional work. Surveying, levelling, tracing, &c.—F. H. CARTER, 8, Evelyn-road, Richmond, S.W.

An Architectural Causerie.

THE opening of the winter session of the schools opens up, year by year, the old questions of education and examination.

Though these are both subjects of controversial interest, on certain aspects of which there probably will always be as many opinions as there are controversialists, yet, on certain other aspects, the great majority of those best qualified to know are gradually coming to be of one mind. With regard to education, the idea is more widely spreading that it should be purely and simply a training of the mind and faculties, and not the acquisition of formulæ and facts; that as regards the mental powers, that man is educated who has been trained to think logically for himself, however ignorant he may be of certain facts or opinions; while, on the other hand, the man who has taken all knowledge as his portion, and has made himself a perfect encyclopædia of facts and methods, may yet be a man of no mental education whatever. When we think of the methods employed in the various institutions for the teaching of Architecture, we must come to the conclusion that there is little real education—that is, training of the reasoning and perceptive faculties—to be obtained in them. Unless, therefore, a boy comes to them with faculties already trained by one of the great educators—the Classics, the Mathematics, or the Natural Sciences—there is a great danger of his going through life with a mental equipment which can best be described, in the language of the auctioneer, as a “choice assortment of oddments.” As a necessary consequence, the same definition will apply to his architectural productions. Of course it may be said that the preliminary education is taken for granted, that the boy is supposed to arrive with a logical mind, capable of grappling with and sorting and arranging the mass of miscellaneous information with which he will be crammed. But to present Architecture to the student in this way is very hard on him, when it could just as easily be presented to him as a continuous and complete system, which would be easily and quickly grasped and understood. There is always the opposite view of education to be reckoned with—the view of the man who expects his son to be taught book-keeping at school, so that it may be useful when he puts him in a merchant's office, and who calls the acquisition of such useful information—education. It is to be feared that this point of view still lingers among us to a very great extent. The student is always keen to design in the schools, a subject which he is likely to meet with in his future practice, so that when that day arrives he may have it at his fingers' ends, and be saved the trouble of thinking for himself, thus defeating the whole object of his education, which is to force him to think for himself. If in the schools the only subjects set were those which we rarely or never meet with in practice, we should find ourselves—on being

called on to design something in every day use—compelled to think and to apply the principles which we have learnt in the schools to the new problem before us. And if more attention were paid to principles and reasons than to features and facts, though we might not leave the schools with a very extensive knowledge of everyday requirements, so necessary to the successful practitioner, yet we should take with us well trained and balanced minds capable of grappling with every difficulty as it might arise. Everyday requirements are quickly picked up in everyday practice. In our public schools and Universities the examination system is largely responsible for the

ON REFLECTION.

Defalcation at Spring Gardens.

THE Progressivist's policy of exploitation of labour is likely shortly to bring the party into such another disrepute as that which followed the report of the special committee on the “Works Scandal.” After that report, the leader of the Moderates, Lord Onslow, urged that as the Department's work was no better than that of the contractor, and was, moreover, conducted at a loss, the Works Department should be swept away. The Progressivists, however, satisfied themselves by appointing a new manager,

THE ENTRANCE TO CASTLE COCH. SKETCHED BY C. E. MALLOWS.

immense amount of cramming which has taken the place of education. While entrance to the army, navy, and civil services is by examination, parents will insist that their sons acquire the necessary information, and schoolmasters have no alternative but to supply it. In Architecture, however, though the introduction of examinations has doubtless had its bad effect on education, yet it can hardly be accounted responsible altogether for the present system. Before the days of examinations, the acquisition of rule-of-thumb methods and practical facts was considered education. All that examinations have done has been to intensify this, and to lead to a more systematic acquisition of the desultory information necessary to pass—a process of cramming fatal to all true education.

A. R. J.

under whom the losses have been proportionately greater, although there is no doubt that all has been done that was possible to mend the state of affairs. It is reported that a loss of £22,000 has been incurred in the matter of the construction of the Lewisham sewer, and this will swallow up any incidental saving that may be presented in the return of the completed works, which it is expected will be laid before the Council at the next sitting. Commenced in July, 1895, at an estimated cost of £63,850, the work has only been completed at a cost of some £85,000. This is inexplicable when we recall the statement of Sir A. Binnie that he always allowed a wide margin in his detailed bills of prices for underground work, on the principle that the Council ought to insure its own risks. The real explanation seems to lie in the con-

FROM A SKETCH BY L. EDMUNDS.

spired indolence of the workmen employed, and it would appear that this is only another case to point the accuracy of the imputations lately brought against the building trades in the daily press, and reviewed at the time in these columns. We learn from *The Globe* that on more than one occasion letters were addressed to the editor complaining of the way in which the men engaged on the Lewisham sewer loafed about smoking and talking. This, we think, might be prevented by appointing overseers and foremen with discretionary powers as to the employment of the individual workmen, such as is done in private firms.

The Modern Craftsman.

SIR CHARLES ROBINSON, Her Majesty's Surveyor of Pictures, in a somewhat commonplace article on Art Museums in the current issue of the *Nineteenth Century Review*, tells a story which is a typical illustration of the influence which the trades unions exert to repress and crush down, not only the revival of craftsmanship, but the personal ambition of the individual worker. A young plumber, Sir Charles Robinson tells us, came to him one day with an oil painting he had made, and asked his assistance to the pursuance of his Art studies at the Royal Art College at South Kensington. The picture was a meaningless daub, lacking indication of any ability in the painter, and Sir Charles' advice to the young

man was that he should stick to his trade, and make himself a first-rate plumber. "What's the good of that, sir," was the reply, "however clever I might grow to be, the trades unions would never let me get a shilling more money." The plumber, no doubt, made the most of his wrong, for although his statement may be true for the generality, the exceptional man will always make an exceptional case. The evil is that to excel should be difficult and prejudicial to a craftsman, and that the scant reward which Art at best offers in exchange for the self-denial and devotion by which alone it may be attained, should be made more difficult and irksome by external circumstances. In our issue of the 7th inst. we published a letter from a correspondent, who pointed out the inadequate opportunities a craftsman has to improve himself or to cultivate his special abilities in the employ of ordinary builders, and how the foremen are rarely selected from the ranks of the competent workmen.

Vestry Irresponsibility.

A SHOCKING "drain" case was lately tried before Mr. Justice Lawrence and a special jury. The plaintiff was a dress-maker, living and carrying on her business in Fulham Road. Without notice the defendants, the Fulham Vestry, entered her house, drove her and her furniture to the upper rooms, dug trenches, tore up the floor,

smoked, littered the place with *débris*, and allowed foul earth to lie on the premises for a period stated variously at "three weeks" and "as short a time as possible"; thereby creating a stench of which a vestry workman could only say that "he had been in a worse," driving away plaintiff's business, killing her mother, undermining her own health so that her doctor was in daily attendance for three weeks, and at intervals for some months, and infecting her with blood poisoning to such an extent that a year afterwards she had not recovered her health. The work was in progress for a period variously stated at from three to over five weeks, although on the evidence of Mr. Williams, architect, the work should have been completed in not more than fifteen days. Plaintiff's own drains were in good order, the drains of her neighbour, which ran under the house occupied by her, being the cause of the trouble. The defence of the Vestry for all this reputed ill they had occasioned does not strike our lay mind as pertinent or sufficient. It seems to us to lack humanity. Its case was that this drain was not really a drain at all. It was a sewer. And the jury found that, in point of fact, it was a sewer all the time, though they disagreed on the question of "unnecessary annoyance." Being a sewer, the Vestry's outrage is justified at law, and the plaintiff no doubt is by this knowledge consoled for her bereavement, her ruined fortunes, and shattered health.

A Strange Inadvertence!

THE Standard, in its account of the laying of the foundation stone of a church in Brixton by Princess Christian last week, makes a curious slip in neglecting to omit the name of the architect, Mr. Beresford Pite. It commits a further irregularity also in introducing a mention of the design of the church, but no doubt the writer of the article would excuse himself by pointing out that his report was half a column in length; that his description of the church was brief and quite vague, as he only remarked that it was built in the "Early Christian Style"; and that as an offset he introduced a full description of the marquee, and the platform, and the red floor cloth, and a full and detailed account of every visible article of clothing worn by Her Royal Highness. It is, of course, no business of ours, but we may warn the Standard that these innovations will endanger its reputation as a leading English daily paper, and we would point out that its action in mentioning the architect's name in the *first* paragraph, and those of the churchwardens in the *last*, and in bracketed parenthesis, is, to say the least, daring. The vicar, in an address to the Princess, which embodied an account of the parish and the church, used all care not to refer either to the design or the architect, and was eminently successful in his attempt.

Two Late Decisions.

REPORTS from the Arbitrator's Court at Leeds present a case which is worthy of notice. A claim was made by a widow for compensation under Sec. 7 of the new Act, against a firm of house painters. Her husband was employed by the firm in painting a house front, and when standing either on a ladder, or on a plank reaching from it to a window sill, a rung of the ladder broke and the poor fellow was killed. The arbitrator, in giving his decision against the claimant, made two new precedents under the Act. First, that a ladder, or a plank resting thereon, could not be construed as a "scaffold." Second, that painting, plastering, or puttingty could not be included in the term "repairing." Leave to state a case for the County Court judge was granted to claimant. It is to be hoped that these decisions will be reversed, or men employed in the precarious business of house decorating will not be able to benefit under the Act.

UNIVERSITY OF ALABAMA

AN OLD WELSH CASTLE.

By J. M. STANIFORTH.

CASTELL Coch (Red Castle) is about five miles north of Cardiff, and is picturesquely situated on the side of a wooded mountain. Little is known of the history of its early days, but it is supposed to have been commenced in the reign of Henry II., and probably completed in the time of Edward I.

There are various traditions concerning it, but a great deficiency of recorded information. Being the key of the upper country, it must have witnessed many an inburst of the native Welsh, from the Norman Conquest to the days of Owen Glyndwr, who is supposed to have descended by this pass when he burned the episcopal palace of Llandaff and ravaged Cardiff.

The ruined castle descended with the rest of the De Clare estates to the Marquis of Bute, who, with the assistance of the late William Burgess, has restored it to, as near as possible, its original state.

In general plan it is a triangle, each angle capped by a drum tower; its general divisions are the south, east, and northern towers, the gate tower, the curtains, and hall. It has also a drawbridge, portcullis, and courtyard. The internal decorations are in the Mediaeval style, and are of a most gorgeous character.

The River Taff, from its origin under the Brecon Beacons, after a course of about twenty-six miles through the northern and mountain district of Glamorgan, escapes by a deep and narrow ravine across the last elevation, and rolls its course, unfettered, to the Bristol Channel. The ridge which it thus finally clears, and which divides the hill country from the plain, is part of the great southern escarpment of the coal basin of Glamorgan-shire, supported there by the mountain lime-

stone rising from below, and, in its turn, reposing upon the old red sandstone, the denuded surface of which forms, under the later horizontal rocks and drift gravel, the basis of the plain. The escarpment, extending for many miles along the contiguous counties of Monmouth and Glamorgan, is traversed in this immediate neighbourhood by the three passes of the Ebbwy, the Rhymney, and the Taff. The heights bounding the latter river, though in actual elevation below some other parts of the chain, produce a very striking effect from the abruptness of their rise from the plain. These heights on each side of the pass must always have been regarded by the inhabitants of the county as places of great security. On the right bank of the river the huge lumpish sandstone mass of the Garth rises to 980ft. above the sea, and is crowned by two remarkable tumuli well-known as landmarks in the Vale, and visible even from the distant shores of Somerset.

The elevation of the left bank, though lower, is more precipitous. It presents, in

CASTLE COCH: THE ENTRANCE. FROM A SKETCH BY J. M. STANIFORTH.

CASTLE COCH: A GENERAL VIEW. FROM A SKETCH BY J. M. STANFORTH.

the lichen-stained crags about its summits, and the rich verdure which clothes its sides and base, all those features so well known to geologists as characterising the scenery of the mountain limestone.

Nature has rendered the west and south sides of this height—those exposed to any foe from beyond the sea—nearly inaccessible. Across the north-eastern side lines of circumvallation have been hewn out of the rock, the dimensions of which show the value attached to the place, as a fortress, by the Cymry.

There was reason in the choice. From hence the long ships of the Danish rovers could be seen while yet distant from the shore, and timely notice given and protection afforded to the people of the plain, should the ravagers extend their sweep far inwards from the coast. A beacon fire upon the headland of Penarth—celebrated in Anglo-Norman verse for its ancient oak, and now marked by its prominent church—answered here, or on the opposite Garth, would be repeated from the summits of the distant mountains of Brecon and Carmarthen, and would at once spread the tidings of invasion over the whole of the southern coast.

The Normans, within a century and a half after the conquest of Glamorgan, had completed a chain of castles along the plain country, from Chepstow to Pembroke, and were only exposed to the invasion of the Welsh from the mountain tracks upon the north. To check these, they threw up a number of fortresses, either upon or within the verge of the hill country, of which Cærrhyll on the Rhymney and Castell Coch on the Taff may be cited as adjacent examples.

The site of the Cymry Camp was far too difficult of access to allow of the ready transport into it of provisions, or munitions of war, or of a constant and rapid communication with

the chief castle of Cardiff. Lower down the scarp, though still high above the plain, the Norman engineer selected a natural platform on the limestone rock, separated from the main scarp by a natural depression, and sufficiently removed from the summit to be out of reach of any military engines with which the Welsh were likely to be acquainted, or which, from their want of organisation, they were likely to be able to bring, with their forces against the castle. There is an easy approach to this platform from the east, which probably communicated with the old road, called Roman, and no doubt Cymric, which leads direct from Cardiff to Rheubina, and close upon which is the circular mound which appears to have been the site of a tower, at Whitchurch and the Celtic tumulus of Tympath. Upon this platform was erected the fortress of Castell Coch.

For detailed description of the old castle when in ruins, see *Archæologia Cambrensis* or *Mediæval Military Architecture* by Clark.

The Vinyard at Castell Coch is the only one in England where real wine is produced successfully.

LORD ROBERTS has laid the foundation stone of the Soldiers' Victoria Hall, Western Heights, Dover.

THE Scotch Education Department have awarded four Queen's Prizes, value £2 each, to students of the Architectural Department of the Glasgow and West of Scotland Technical College, namely, one in Architectural Design to James M. Alexander, one in Architecture to John M. Arthur, and two in Building Construction—one to James A. Ferguson and one to Robert Park. These prizes are awarded to those students whose papers are considered best in the May examinations.

MR. HERBERT J. FINN'S DRAWINGS.

THE reader of this brief notice will have opportunities during the next ten days of testing the value of our opinions, for the Modern Gallery remains open until the end of the current month. It may be mentioned, moreover, that paintings by the same artist are exposed in the same manner each year, so that he who fails to see them now will be able to do so later. The lover of Architecture who thinks the painter should be his servant will probably look most attentively at the views of English cathedrals and buildings, remarking that the portions presented are generally the most picturesque, and that the work has the indescribable "summat" which gives the distinction of style to what might otherwise seem mechanical. Said one in our hearing, who referred to the artist's manner of painting: "It has a fluttery feathery look," a defect, if so we must call it, which at any rate impoverishes the reproductions given on pages 314 and 315. To the writer it seemed that his friend should have looked twice before speaking once, for there is absolute truth in these drawings, and they might have looked hard if handled another way. It appears that Mr. Finn, during the last few years, has traversed pretty much of the country, for the collection contains scenes from a good many parts of it, coast scenes more especially, but the feature of this exhibition is the series of paintings in and about Winchester, Canterbury, and St. David's. It may be news to some that there is a "Mint" remaining at Shrewsbury, which, from our point of view and that of the painter, is a very beautiful object. There are fifty-three works altogether, including landscapes pure, and some homely domestic subjects.

The Position of Architecture among the Fine Arts.*

BY EDWIN T. HALL.

(Continued from page 296.)

I SUGGEST that a good plan, well thought out on the lines I have roughly endeavoured to sketch, is a work of Architecture, although the exterior may be absolutely plain—nay, even uninteresting. If, however, the exterior is to be ornamental, this effect should not be attained by added ornament having no relation to the interior, but

THE DECORATION SHOULD HARMONISE

with and suggest the interior and its occupants, just as in a work of sculpture the exterior of a figure suggests the internal framework—the well-developed muscles, the network of nerves, and, above all, the impulse which actuates them. To attempt a work of Architecture by first settling the exterior and then designing the plan and general interior to lead up to it is fatal. As an illustration of the correct principle of design, let us consider the idea of a Town Hall. It is first the centre, the heart of municipal life, whence all other parts of the municipality are governed. It should thus be placed in the centre of a town, in an open square or place. Its various departments—or, to use a conventional phrase, its cells—should be emphasised externally and internally. The emotions pertaining to each should be considered and depicted, or rather suggested; the relative importance of each to the other should be weighed in locating them; the prison cells, the Courts of Law, the offices, the entrance and assembly halls, the suite of reception rooms, &c.; simplicity of plan and easy access to the departments being essentials. The physical proportions of each group should evolve from these considerations, and, in the mind of the architect, the exterior should grow *pari passu* with them, and should express each group and

THE UNITY OF THE WHOLE.

The design of the exterior should also stamp with expression the mechanical functions of the several parts of the construction, and thus, as the various members of a human body are fitly joined together, the whole conception will convey to him who has eyes to see and mind to appreciate, the idea sought to be expressed. In times not long past these principles were ignored, and the exterior was designed, or rather copied, from a Classic temple—from a building which externally expressed faithfully the one cell which it contained, the abode of the god. Such an exterior has no relation to the complex buildings of to-day. Or let us take, at the other end of the scale, the idea of a workman's small dwelling. My friend Dr. Godfrey Sykes, a well-known medical officer of health, remarked to me lately that the solution of the problem of housing the million should be regarded from the sanitary, social, and ethical standpoints. Now the backbone and basis of our social policy in England is the home. The idea of a home is lost when a family is compelled to live in one room. What, then, is the idea of a home? Its central feature is the place of reunion of its various members—the living or common room—well lighted by windows and warmed by a stove or open fire. Where outlay must be restricted we cannot waste money on passages, and there can be no objection to let the common room be

A CENTRAL HALL,

with bed rooms opening from it on two sides, the third side containing the scullery, water-closet, &c., disconnected by a ventilated lobby. Each bed room should have a window and a ventilating flue, while the heat from the common room stove will be sufficient to warm the bed rooms, and save the cost of fireplaces and of fuel. Such a humble dwelling will be a home, and a congeries of such homes may

be placed side by side in the country or one upon another in a town. In the latter case the staircase should, of course, be external to the houses. The æsthetic in such a dwelling as we have described can be expressed in simple ways, in little thoughtfulnesses of detail, in showing consideration for the housewife's wants and aspirations, making windows that will take flowers, in provisions for fostering modesty, &c. In considering the expression of construction let us compare two types of buildings, and see the relation of the construction to the design. Take a barrel-vaulted church. This vault, having an equal thrust at all parts of its bearing on the wall, demanded and received for its support a massive wall equal in thickness throughout its length, with relatively small openings. In such a case, buttresses at any points would be out of place. By contrast, take a groined vault; here the weights and thrusts are concentrated on points, the wall between these points is but a screen, and can be light in treatment, and may be pierced with windows of any size.

THE POINTS OF SUPPORT,

however, require to be of large horizontal section, and buttresses become necessities evolved from the construction. Did time

permit, we could trace how this groining and concentration of loads led to all the characteristic features of Gothic design. In Viollet-le-Duc's "Rational Building" we have the whole scheme worked out. It has a peculiar bearing on the subject of our paper, because it shows how practically a new Art development was laboriously worked out from construction. It teaches us that "Art is the result only of sober, cool, intelligent thought and technical knowledge, which is acquired by hard, persistent, and long-continued labour," and further, that that labour evolved a result not otherwise to be attained. M. le Duc shows that practically the Romanesque builders had before them the remains of Roman vaulted buildings in their country and nothing else. They were not travelled men, they were too poor to import architects from abroad, and not having the command of unlimited labour and wealth like the Romans, they set their intellect to work to devise some means of getting similar results with home material and home labour. Our author shows how, in the earlier part of the eleventh century, they built

BARREL-VAULTED CHURCHES

and halls which half a century later fell down; how, profiting by their failures, they again set

CASTLE COCH. SKETCHED BY C. E. MALLOWS.

* A paper read before the Architectural Association on Friday, Dec. 9th, 1898.

CASTLE COCH FROM THE RIVER TAFF. FROM A SKETCH BY J. M. STANFORTH.

to work with renewed energy and experience, and gradually, by slow but certain steps, evolved the Gothic-groined vault; how this in turn led to the plans of piers, how the capital became a corbel, instead of being, as it was in many Egyptian, Grecian, and Roman buildings, not a support but only an ornamental termination to a column. This may be seen at Edfoo, where the abacus is of the same width as the diameter of the column, while the capital is projected far beyond it, or in other examples, where, instead of abacus, there is a square shaft between the capital and the entablature; and, again, in the groined vaults of some of the Roman thermæ, where the plan of the vault abutment is a square of the same dimension as the diameter of the column supporting it; above the capital and below the vault springing is placed the complete entablature of the Classic order. In some churches, both in Normandy and in England, capitals are dispensed with, but this appears to give weakness to the design. A mark of separation between the function of the arch and that of the pier is of great phonetic value, and as such the capital or impost moulding has commended itself to the great majority of our buildings. Reverting to

THE GOTHIC ART-CRAFTSMEN,

we note how they carried down their arch mouldings into shafts on the face of the reduced piers, and so step by step and line by line a new art development—a new Architecture—grew out of and was determined by the construction which it boldly displayed. Gwilt says: "There is more constructive skill shown in Salisbury and others of our cathedrals than in all the works of the ancients put together." It is not out of place to note in this connection

that while the Gothic shaft grew downward from the moulded arch, the shafts or fillets on the angles of Egyptian pillars grew from below and terminated in the non-functional capital. We hear of taste in Architecture, we hear of genius, but neither one nor the other could have dispensed with the more sterling and laborious qualities which evolved the new Gothic art, an art which has commanded and still commands the admiration of all who see its harvested fruits. And here it is pertinent in parenthesis to remark on this much misused word taste. It is often spoken of as an intuitive gift, and many who arrogate to themselves its possession, dogmatise on matters of Art as though the appreciation and knowledge of Art

NEED NO TRAINING WHATEVER.

Artists are not so easily made. Taste to be of any value or authority must be the outcome of wide observation, of judicial power of comparison, and of education in its widest sense. And even then it is a variable standard which each sets up for himself, the result of his study or environment, and therefore in no way a standard of universal application. To a devotee of Classical Architecture, the proportions of a Classic column are in the best taste, while those of a Gothic shaft are barbarous, and *vice versa*. Of genius in Architecture we may say, as Mr. Froude says of the gifts of strength, of wealth, of rank, of worldly power, "It is a splendid instrument if nobly used, but requiring qualities to use it nobler and better than itself." The architects and craftsmen of our most beautiful mediæval cathedrals evolved their masterpieces, as we have seen, by laborious

study of the materials they had to deal with, of the forces exercised by their material employed in different ways; and the constructive features arising therefrom became the motives on which their design was based. The various phases and incidents of Christian worship and ritual then led to the general planning of their building; the nave, the aisles, the transepts, the chapels, the choir, the chancel, the sanctuary—all made subservient to, or rather based on, the Cross, the great emblem of their faith—and subsidiary to these, the chapter house, the library, the offices, the cloisters, &c. In every part we see

PLAN AND CONSTRUCTION EMPHASISED

as integral parts of the Art expression. In them there is no room for talk of the work of the engineer and builder first, and the clothing of Architecture added to this. Architecture as a fine art is everywhere, and the Art atmosphere pervades the building not only in Architecture, but in painted walls, windows, and roofs, in sculptured figures, traceries, and canopies, in music, in stately processions of men, in waving banners, in adoring congregations—the whole having its main aim in rendering glory to the invisible God, a God whose majesty and mystery, as revealed by Christ, led to the soul's uplifting in a way that must have been unknown to the Greeks, whose gods were but deified mortals of whom their votaries could have had but a measurable appreciation. These were days when Art permeated the masses, in dress, in pageantry, in village festivals, in guild processions. Be it remembered, I speak of the period when the priesthood of the Christian Church were self-denying men, living in a chosen poverty, the teachers, the guides, the protectors of their flocks, drawing to them all that was good and great and generous in rich and poor alike; and before

THE GREAT CANKER OF WORLDLINESS,

of wealth, of lust of power, of intrigue and immorality had sapped their influence for good; before the Pope had in 1489 commissioned the Cardinal Archbishop Morton, his legate, to make inquisition into the charges made against the monasteries, resulting as it did in such a condemnation by the legate as justified beyond question the worst of the accusations. In the earlier times Art was a power to raise men. In the degenerate days towards the early part of the sixteenth century it not only lost its power over men, but it came to stink in their nostrils as associated with the falsity of those who had been its leaders and patrons. And with this loss of faith in the Catholic Church, the cult of Gothic Architecture as a living and growing Art fell into a trance, and so remained for centuries. The moral shock not only brought about the Reformation, it chastened the laity, hardened their natures, made them puritanical. Their reverence of God was indeed intensified. The virility of the people asserted itself, and the horrors perpetrated in the western hemisphere by the most Catholic Spanish nation sent such a thrill throughout England that no wonder the gentle and refining

INFLUENCE OF ARCHITECTURAL ART

was replaced by zeal and hatred against the system with which it was most closely related. The energy of the nation was diverted. It became the instrument of Spain's destruction, and in fulfilment of that mission the great men of the Elizabethan era—Drake, Frobisher, Gilbert, Davis (whose name is perpetuated in Davis' Straits), Hawkins, Raleigh, and many others became the pioneers of that colonial empire of which to-day we see the development. The lives of these men are most interesting studies. That they were impressed with a firm belief that they were doing God's work is beyond question. They were human, and some of them blunt, unlettered men with faults grave enough, judged by our standards of to-day; but Froude, Charles Kingsley, and Towle give us pictures of the purity of their lives, of their chivalry, their devotion to duty. It was in such an atmosphere, and with these heroic surroundings that Shakespeare—as we are reminded by Froude—found living models for the finest and noblest of his dramatic

characters; so that if Art in one of its phases was banished, in another it blossomed in a way that has never been surpassed. But while Shakespeare in immortal drama wrote of men and manners of history and philosophy, Architecture remained

THE HISTORY IN STONE

of the past and passing ages; of the life of the nation from generation to generation. Take an old church begun in the early centuries of our English civilisation; and see how the gloomy interior of the earliest period is opened up to light by large windows of a later period; modified in other respects from time to time; the rood screen, once the line of demarkation between the clerical and the lay, now denuded of its titular ornaments, often removed from its normal position to inclose a side mortuary chapel or a secular lord's pew. Such a church tells us of the evolution of our history and race—whether upwards or in decadence—of sacerdotalism, of puritanism, of the autocratic king or the revolutionary rabble. The beautiful building—the emanation of man's aspiring soul, the offspring of his highest faculty—the creative—breathes of man's high mission, "its tenderness, its heroism, its regrets, its aspirations," as Oliver Wendell Holmes expresses it. What so grand as the interior of Westminster Abbey? Her Architecture, itself marking epochs in the nation's life, scarred but not marred with monumental records of her son's self-sacrifice to duty; of their energy, their learning, their great endeavour in all the paths of

PHYSICAL AND MENTAL ACTIVITY.

In what gallery of painting or of sculpture can such sublimity be found? Here the sculptor's Art appears as handmaid to attend the sister Art. Sculpture is most sublime when, as here, it seeks not its own glory but to minister to hers; when it adds the grave and chaste beauty, so peculiarly its own, to the solid qualities of her reposeful dignity. But while this is true, it is also true that each of the arts has its separate identity, a personality as distinct and as responsible as that of any member of a human family. Each must work out her own salvation, aim for her own ideals and in such aim she may, and too often does loosen the ties which bind her to her sister arts. Yet let us again insist that Architecture is organic. Sculpture is a representation of organic; painting is inorganic, illustrative only. In Architecture sculpture may organic part of the structure, as figures in a Gothic doorway or as the caryatides in a Classic temple, but in such relation it is an accessory to Architecture, a blossom on the tree. In a somewhat different category we may cite

THE SCULPTURE ON THE PARTHENON.

This is organic, and I particularly wish to refer to the frieze. It has often been conjectured how this frieze came to be placed in the shadow close up to the cornice of the cella within the peristyle. It seems to me this stately procession in such a position, viewed from a short distance, broken up as it is by the columns, appears unending, mysterious, and perhaps was intended to be symbolical of the march of conscious life through all the ages. Detached works of sculpture are best seen to advantage within or in juxtaposition to a building. Viewed with a natural background of foliage, disassociated from anything Architectural, they appear lifeless; but on a background of man's architectural creation they become instinct with life; they are then like jewels of price on the neck of a fair woman, embellishing and embellished. I have referred to our Valhalla, but the Loggia de Lanzi of Florence will be recalled by all as another illustration. A painted picture is different. It needs, it is true, to be housed, owing to its

RELATIVELY PERISHABLE NATURE,

but for its appreciation as a picture, it demands exclusive attention, to be separated from its surroundings, the vision to be bounded by its frame, and the mind of the beholder to be detached from all else. It is true that painting sometimes elects the position of handmaid to Architecture when it is employed decoratively—it may be in a series of historical

records locally appropriate to and fitly forming part of the architectural monument it embellishes. In this case each picture has some harmony with its fellow pictures and with the sombre neutral hues of the stone. In such case painting becomes broader, more Catholic. The same applies to painted windows. They form part of the architectural composition; they enrich and beautify it; their detail is there, inviting careful attention, but, like the surface carving on the exterior of a Venetian palace or the walls of a Gothic church, they are primarily the mosaic incrustation giving brilliancy to the whole structure. Returning to our survey of Gothic Architecture, we find that with the downfall of the monastic orders in England, and the Conti-

might decorate than works of Architecture. They built, it is true, large buildings, but in few of them is the art a natural outcome of the construction. Many are frankly but backgrounds for painting. As an illustration, we may cite the Chapel of the Arena at Padua, painted by Giotto. It is a plain, rectangular room having a painted wagon-vaulted ceiling with windows on one side, and not a moulding on the surface of walls or ceiling. As

A WORK OF THE PAINTER'S ART

the interior of the building is acknowledged to be of the greatest beauty. The Sistine Chapel at Rome was commenced 1473, finished 1541, and Mr. Fergusson, in order to show the difference between the arts north and south of the

CASTLE COCH: COURTYARD FROM THE ENTRANCE. SKETCHED BY J. M. STANFORTH.

mental upheaval brought about by Luther; with the revolt of the laity against the priesthood,

GOthic CHURCH BUILDING CEASED,

and closely following on its cessation the army of Craft Freemasons was disbanded, or, rather, dissolved to atoms. The revolt was so complete that Gothic Architecture in England was banned as associated with oppression and licentiousness, the virtue and self-abnegation of its artistic founders being forgotten. Meantime, the revival of the study of Greek literature disclosed to the student, as a new revelation, a people free, untrammelled, heroic, artistic, and god-like, the authors of pure and beautiful architecture, and cultured Europe turned to this fount for inspiration in all its art life. In Italy a demand for architectural monuments based on Classic lines found no school of architects at hand trained in the principles of their art, in the sense that the Gothic architects were trained. The sculptors and painters who were called to design the new Renaissance buildings were not hampered by preconceived theories of design, or, indeed, by technical knowledge of old buildings, and, although they sought to create, they were more anxious to build palaces which they

Alps, makes a comparison between it and King's College Chapel at Cambridge, built at the same time, 1479-1530. The Roman Chapel externally was a barn, internally it was almost devoid of architectural mouldings or decoration. It had a barrel-vaulted ceiling, groined over the semicircular-headed windows at the sides. Its walls were covered with paintings by several artists. Its ceiling was painted by Michael Angelo, and later the wall over the altar was filled with his great work "The Last Judgment." The Cambridge Chapel, on the other hand, externally has a rhythmic division and a rich architectural treatment, while internally it is a web of architectural detail, all growing out of and

EXPRESSING THE CONSTRUCTION.

It has its pictures, but they are transparencies in glass. The Sistine Chapel has been well and often described by able men, but if it has not already been noted I should venture to make a criticism in regard to its ceiling. This is a plain surface semicircular in section, divided into compartments by painted mouldings. As is well known, the central flat compartments from end to end are occupied with subjects ranging from the Creation to the Deluge, all illustrated with colossal figures,

CASTLE COCH. A SKETCH BY C. E. MALLOWS.

A spectator looking towards the altar sees the figures, it is true, in their proper or intended position, but seen from the altar end they are upside down and grotesque. Now, had all these compartments, instead of being flat, been constructed as shallow domes, either circular or square on plan, no such defect could have been possible, all figures that could be seen from either end or from the sides would have appeared natural in a partially upright position on the concave surfaces, and would not have looked as if they would fall. None could have been seen upside down, and from the art side we should have had the idea that each of the subjects forming

THE DECORATION OF THE DOME

separately sent up its praise and adoration to the Most High. In St. Paul's Cathedral Wren had evidently this aspiring idea in mind when he treated his ceilings with shallow domes throughout. In Sir W. Richmond's beautiful decorations of the choir we lose the painful impression of the Sistine Chapel, and do not feel that his figures will fall while each compartment raises its pæan to heaven. In St. Peter's at Rome, there are domes in the aisles, but the nave is a long plain vault. I do not propose to enter here into any comparison between St. Peter's and St. Paul's, except in so far as it relates to my subject, but in that relation I would remark that, if the Sistine Chapel ignores Architecture, St. Peter's on the other hand misuses it. At least three designs were made for it, and the conception appears to have eventuated in the idea of obtaining a

building with architectural features and details on a colossal scale, but instead of the resulting effect being a beautiful monument, the immense dimensions of which could at once be grasped, the mark has been overshot. All scale is lost. The Gothic cathedral architects kept their detail—their shafts and mouldings, and even their stones—small, and, judged by the scale of these, their buildings looked very large, while it is stated as a fact that some of the largest are but of the dimensions of an aisle of St. Peter's. Is it possible that this error arose from the fact that the Glory of God was not the only or

MAIN OBJECT OF THE BUILDING,

but rather the Glory of the Pope, who wished to emphasise the majesty of his power among the nations? In St. Paul's Wren avoided the error of colossal detail; his internal proportions became in consequence better, and there resulted a vista of imposing dimensions which the mind could grasp. The internal grouping, too, became more graceful; the double order, instead of the single one of St. Peter's, appears to lift up the roof; the domical compartments in the ceiling, to which I have already alluded, added to this effect, and led up to the great transeptal lantern and dome, the whole a conception of aspiring lines leading the eye and the soul ever upwards. Externally, in almost every part it appears to be superior in grace of proportion.

(To be continued.)

LONDON COUNTY COUNCIL.

At the meeting held on Wednesday last, it was agreed, upon the recommendation of the Finance Committee, to lend the Hammersmith Vestry £11,020 for electric lighting purposes; the Newington Vestry £10,000 for the same purpose; the St. Giles' District Board £17,160 for land for a depot; and the Wandsworth Guardians £3000 towards the cost of additions to the workhouse.

THE WORKS DEPARTMENT: HEAVY LOSS.

The Finance Committee reported that the works completed by the Works Department during the half year ending September last showed a loss of £21,000. The greatest loss was on the Lewisham main sewer, the final estimate for which was £54,092, and the actual cost £77,016. A further statement was put in showing that since the department was established the "loss" had been £40,866 on work costing £793,722. The jobbing works showed a net saving of £6185 on works costing £82,139.

WATER BILLS.

The Parliamentary Committee brought up a report with the draft Bills to be introduced in the ensuing session. The first was the London Water (Purchase of Companies) Bill, the arbitration clause being known as the "Plunket" clause; the next was the London Water (Welsh Reservoirs and Works) Bill; and the next the London Water (Aqueducts and Works) Bill.—Mr. Cornwall, in moving the adoption of this report, said there was only one alteration in the estimates for the Welsh scheme. Sir Alexander Binnie had asked that the estimates should be raised from £16,500,000 to a round figure of £17,000,000. It had been found impossible to get the whole of the plans of the aqueducts finished in time to comply with the Standing Orders, but it was hoped that Parliament would see its way, after learning the circumstances, to suspend the Standing Orders and allow the Bills to proceed.

THE HOLBORN TO STRAND SCHEME.

The Parliamentary Committee brought up a draft Bill in relation to London improvements (Holborn to Strand, Southampton Row widening, High Street, Kensington, and other works), and asked for the approval of the Council.—Mr. Campbell opposed the financial proposals of the Holborn to Strand section of the Bill on the ground of the excessive cost of the scheme.—Mr. Benson said he thought that few had realised the cost in interest to the ratepayers on the enormous sum proposed to be spent. The cost of the improvements would be £4,900,000. The four millions, however, would be required for the purchase of land and houses, the value of which would come back again into the pockets of the Council as capital returned. The net cost of the improvements would be about £900,000. In short, he argued that the interest on the sum for the improvements should be raised as capital expenditure. If they did not, it would mean an immediate increase of three farthings in the rates.—Mr. W. W. Bruce said the Chancellor of the Exchequer had agreed that there should be practically no charge upon the ratepayers until the work had been finished. Then the whole of the properties acquired would be in the hands of the ratepayers. The amendment was lost by seventy-two to forty.

THE PARLIAMENT STREET IMPROVEMENT.

The Improvements Committee submitted a long report on the subject of the great street-widening scheme now being carried out by the Government in Parliament Street. The Government had asked for a contribution towards the cost, as a considerable quantity of the cleared land would be given up for pavement purposes. The Office of Works estimated the cost of paving works to be £4000, but the Council's engineer thought that £8000 would be the more likely figure. If the paving of Charles Street were included, the committee thought the Council might contribute £12,000 towards the cost of the improvement.—Eventually the recommendation was agreed to.

ELECTRIC LIGHTING IN COUNTRY HOUSES.*

BY BERNARD M. DRAKE, M.I.E.E.

MR. DRAKE said that to the multifarious knowledge of the architect must now be added a grasp of the "practice" of electric lighting and its attendant paraphernalia. He should confine himself to the practical points which crop up daily in an architect's office, and are searched for in vain amongst the text-books at his disposal. In lighting a country house, the first question concerns the provision to be made for the generating plant, and where it shall be put.

THE VARIOUS DEVELOPED METHODS AT DISPOSAL

are:—1, steam engine; 2, petroleum engine; 3, gas engine; 4, water wheel or turbine; 5, wind engine; 6, primary battery. The advantages and disadvantages of each method were fully considered by the author, whose own experience was that a combination of gas and petroleum, or turbine and steam engine, gave the best results. Each case, however, required an individual study of the local conditions and working requirements before deciding what would be best; it was not a matter which could be safely left to the decorator or hot-water engineer to diagnose. From whatever source the power is obtained, the dynamo for ordinary requirements is the same, except that it requires to be fitted with a fly-wheel for use with petroleum and slow speed gas-engines, providing the engine has to be run while the lights are used. Where only required for charging the accumulators, this may be omitted, as it wastes power. The most important features in the

DYNAMO FOR COUNTRY HOUSE LIGHTING

are:—1, Absence of sparking, which wears out both brushes and commutator; 2, perfect balance of the armature or revolving portion of machine, vibration being one of the causes of what are known as flats on the commutator; 3, strong shaft and wide bearings; 4, good automatic lubrication, the best form being a loose ring revolving in an oil bath; 5, absence of heating—undue heating of the armature and magnets causing unnecessary loss of efficiency. The accumulator is a necessity in every country-house installation, and the position of the room for its accommodation requires careful consideration. For reasonable distances up to 150 yards the engine and accumulator rooms should be placed alongside each other, so that the attendant can see that each cell charges up equally, which is essential to success. Where the current is brought from a distance, or where the light will always be supplied from the accumulator alone, a considerable saving can be made in

THE COST OF CABLES

by separating the engine and battery room. There must be no direct communication between the dynamo and cell room, or the cotton insulation will be found to rot off the dynamo after a few years. In selecting a type of accumulator, the main question is absence of attention, which can only be obtained by having the plates well apart, say half an inch, so that any detached portions fall away, instead of bridging across and exhausting the cell. The author considered that a clear space between the plates was also preferable to enclosing them in any form of celluloid bags or wrappings, which soon become clogged with oxides. The use of a registering meter is recommended in the engine room as the best check on the amount of coal, oil, or gas consumed. The engine house should be placed with due regard to prevailing wind, and not less than fifty yards from the main building. The author next considered the questions of first

cost and working cost, giving data applicable to average country house installations, from which also could be determined the class of motive power to be adopted. Results were also given of a week's recent test with a modern generating plant, for a large installation of 2000 lights. In discussing the lighting of rooms, the author emphasised the necessity of having light and dark portions and, as it were, semi-tones. A room lit equally throughout gives a flat effect, and is neither artistic nor restful. A bright light causes an involuntary contraction of the pupil of the eye, and causes a tired feeling which may ultimately result in eye troubles.

THE IGNORANCE OF ELECTRICIANS

concerning this simple fact is probably responsible for the complications ascribed by oculists to the electric light itself. The secret of a restful light is the illumination of a large surface with an absence of any dazzling spots of small area. In a room thus lit the pupil of the eye expands to its full limit, and the weakest eyes can read with comfort. To get this result either the rays must be diffused by transmitting them through a large shade, or reflection must be resorted to and the direct rays be projected on the walls and ceiling from some hidden source. The illuminated surface is then greater than that of even the largest shades, and the effect more restful. This treatment in the case of light-coloured walls and ceiling is capable of wide adaptation. A combined shelf and picture rail containing a row of hidden lamps for reflected light had been employed by the author, and pretty effects could also be produced with small lamps concealed in the overmantel and in china cabinets. Coming to the question of

FITTINGS IN OLD HOUSES,

the existing candle fittings have often to be adapted, as being in accordance with the style of the room. As regards the objection that imitation candles are inartistic, it must be remembered that the designer had the candle in view as the basis of his outline, and without it the proportions are wrong, and the drip cups and other parts meaningless. An incandescent lamp springing direct from a candle socket is a squat abortion that has nothing to commend it. In these cases every effort should be made to get the precise effect of candles without their disadvantages, and as far as possible to conceal the fact that electric light has been employed. Examples were shown of the way in which old fittings may be treated without detriment to their appearance, and attention was called to the economy of shading only the front of lamps placed against a wall, for thus the full advantage of reflection is obtained, and an eight candle-power lamp will take the place of a sixteen candle-power if totally enclosed. There were also shown

A FEW TYPICAL FITTINGS

made expressly for electric light. Having touched upon the fittest materials for shades, the colours of which should be tested before making a selection; the objections to working the lamps into plaster-work in the ceilings instead of using metal fittings; the precautions to be taken to avoid risk of fire from the heated lamps, the author concluded with some hints on the treatment of the different rooms, passages, and staircases. In adapting candle fittings to a dining room table the wires are distributed by a patented connector lying under the table centre, and neither the table nor the cloth is pierced. One of the best effects produced by the author was in the dining room at Chatsworth, where powerful lamps were hidden in reflectors at the base of the pictures all round the room—thus pictures and ceiling were illuminated and the rest of the room remained in repose. In drawing rooms, which should be brilliantly lighted, the author preferred to light principally from the walls and from standards, as a top light is unbecoming to ladies, causing dark shadows under the eyes. In picture lighting top as well as base reflectors are frequently necessary with large pictures. Lantern slides were then shown of compartments in several houses where the author had been responsible for the

electric lighting. The photographs were taken with very sensitive plates by the electric light itself, and gave the appearance of the compartments when lit.

Mr. Arthur Cates, at the meeting of the R.I.B.A. on Monday night, announced the decease of Mr. Henry Bridgford, of Manchester—elected Fellow in 1888; and Professor Hayter Lewis—elected Associate in 1845, Fellow in 1852. He had served as Hon. Sec. of the Institute for a period, and was twice elected Vice-President, serving that office from 1865-67, and 1878-82; and it was only on account of ill-health, added Mr. Cates, that he had not occupied the presidential chair.—The President, Prof. Aitchison, R.A., proposed a vote of condolence with the family of the late Professor Lewis. Mr. Aitchison said he had known Mr. Lewis for many years; he was a most accomplished architect and a perfect friend and companion.—Mr. John Slater seconded the vote, and alluded to Professor Lewis having claim to their respectful and grateful remembrance by reason of his having held the Professorship of Architecture at University College. The speaker attended Mr. Lewis's classes for several years, and although he did not regard the Professor as an ideal lecturer, yet he could truthfully say that his one desire was to give as much help as possible to the students attending his classes. The vote of condolence was carried in silence, and it was then announced that the Institute had voted £10 to the fund for erecting a monument to the late M. Charles Garnier. They all knew his work, said Professor Aitchison in making the announcement, and he was bound to say that he thought his Opera House in Paris one of the most extraordinarily clever pieces of Architecture that had been done in his time.—Mr. Drake's paper was followed by a second paper by Mr. H. R. J. Burstall, M.Inst. C.E. on "Practical Applications of Electrical Power," of which an abstract will be given in our next issue.

The annual dinner of the North East Coast Institution of Engineers and Shipbuilders was recently held in the Assembly Rooms, Westgate Road, Newcastle.

ABOVE £3000 has been subscribed or promised towards a fund for restoring the parish church of Holy Trinity, Hull, one of the historic edifices of the county of York.

A new organ was opened last week at Weston Church, Runcorn, by Dr. Bridge, of Chester. The organ is the gift of Mr. Thomas Spencer, of Ryton, near Newcastle. Messrs. Young and Sons, Manchester, are the builders.

It has been reported to the Public Health Department that No. 2, Cannon Street is in a dangerous condition. The whole of the cement work of the coping, the pediments, and the architectural decorations is said to be in a dangerous condition, and to require pulling down forthwith.

In consequence of the increasing rents and the additional difficulty of the working classes to obtain houses in the East End, the Bow vestry has passed a resolution calling on the County Council to acquire the Grove Hall site, Bow, on which to erect workmen's dwellings. It is estimated that over 1000 persons could be housed on the site, and provision made for a small recreation ground.

At the monthly meeting of the Metropolitan Public Gardens Association, held at 83, Lancaster Gate, W., the Earl of Meath, chairman, presiding, progress was reported with regard to the laying-out of the Paragon, New Kent Road; and Albion Square, Dalston. It was agreed to plant trees in Upper Street and Ilamford Street, Islington, and to offer trees for certain sites in the Strand and the City. It was agreed to offer seats for the churchyard of St. Andrew Undershaft, to memorialise the Metropolitan vestries and district boards respecting tree-planting in London, to urge the Hornsey District Council to preserve the Queen's Wood in its natural state, and to continue negotiations with respect to the proposed opening of Finsbury Circus, Christ Church Churchyard, Blackfriars, and other spaces.

*Abstracts of a paper, entitled "Some Practical Hints on the Production and Use of Electricity for Lighting Country Houses," read before the Royal Institute of British Architects, on Monday, December 19th, 1898.

The Destruction of Florence.

TO cultivated men and women all over the globe Florence has a special interest. They have been used throughout their lives to look to her with reverent affection as the birthplace of much in our modern culture and civilisation which they most deeply cherish. She is to them a second Athens which in evil days received and handed down all that had survived of the spirit of the first. They venerate her as the cradle of modern literature, as the home of an Art surpassed only by the Art of ancient Hellas, as the hearth where the first sparks of modern thought were kindled from the dying embers of classical antiquity. She is, says the Times, in their minds, a sacred city haunted by memories which mankind can never let die. They visit her in the temper of pilgrims, and as they walk her ancient streets and gaze upon her stately palaces and yet nobler temples they love to people these in fancy with the shades of the mighty dead. The fame and the achievements of her citizens are immortal. They brought about and guided the great movement of the Renaissance—the new birth of the human intellect after the long slumber of the Middle Ages. Nobody who is acquainted with the feelings of the cultivated Florentines of to-day can doubt that their love and enthusiasm for the history and antiquities of their city are at least equal to those of the most ardent amongst the foreign admirers of Tuscan learning and of

TUSCAN ART.

The affection and the care which men like Professor Villari and Professor Mazi, to mention two names out of many, devote to the study of bygone Florence is a sufficient proof that the Italian inhabitants prize, at least as highly as any strangers, the glories of the city in which they dwell. There are many members of the old noble houses of the Tuscan capital not less alive to the incomparable artistic charm of their home as it has come

down to them, and even amongst the people, as the interest they took in the completion of the façade of the Duomo some years ago shows, the old instinct for beauty and the old pride in the loveliness of their surroundings are by no means dead. It must be owned, on the other hand, that recently there have been symptoms of the activity of another spirit amongst the inhabitants of Florence. Some years ago the municipality undertook and carried out a scheme of demolition in the heart of the old town which has filled with dismay all who remember and who love Florence as it stood before this "improvement" was carried out. The then "Sindaco" of the city, Prince Corsini, and other cultivated members of the municipality protested, but their protests were in vain. The "centro" of to-day, with its "ostentatious and dreary square," remains as a startling proof of the things of which the majority were capable. There does not appear to be any dispute that improvements of some kind were absolutely needed in this part of the city for sanitary reasons. All that is urged against the works actually executed is that the demolitions were unnecessarily extensive, and that the new constructions upon the area cleared are ugly in themselves and wholly out of keeping with their surroundings.

THE NEW PIAZZA

is a permanent eyesore, but the lovers of historic Florence would be glad to feel secure that it is not to be enlarged or imitated elsewhere. It must, we think, be owned that a perusal of the letters signed "Vernon Lee" as representing "The Society for the Protection of Old Florence" and the Marquis Torrigiani, is not exactly reassuring. Nothing, it is true, can exceed the courtesy of the Sindaco's answer to the memorialists. He acknowledges indeed a certain degree of surprise that it should have been thought necessary to address him on such a subject at all, and he protests emphatically against the suspicion that the civic representation of Florence is indifferent to its own historic and artistic monuments.

But he assures the signatories to the address that he is proud to see that these monuments are so well known abroad, and that men of such eminence should be concerned for their preservation. He is able, too, to make some statements of a reassuring kind. He declares, for example, that the commune "for the moment" has no intention of doing more than the requirements of modern life in the way of hygiene, communications, and commerce demand. He follows up this somewhat elastic formula by a positive denial that anybody has contemplated the destruction of the Ponte Vecchio or of the houses upon it. He adds that in the quarter across the Arno, about the Via Maggio, where improvements are needed, there is

NO INTENTION OF DESTROYING

"any such houses or characteristic towers as can be preserved in the interests of hygiene." In the conversation which he had with "Vernon Lee" he went further. He stated that the Palazzo di Parte Guelfa would not be touched, that all the threatened towers in the Borgo S.S. Apostoli and the neighbouring streets would be preserved, and that there never had been any idea of pulling down the river side of the Borgo San Jacopo. But, as "Vernon Lee" points out, the Marquis Torrigiani was mistaken upon this last point, and however good may be his personal intentions he cannot bind the hands of his successor. He admits, too, it will be noted, that the appalling project for a colonnade from the "centro" to the Ponte Vecchio still exists in a state of suspended animation. In these circumstances the foreign lovers of old Florence will do well to strengthen the hands of the Italians who are trying to preserve the old monuments of the town. To be efficacious, their efforts must be conducted with judgment, tact, and good sense. The appearance of interference in what is in one sense primarily the affair of the citizens of Florence must be studiously avoided, and allowance must be made for the modern requirements of the city.

RUINS OF THE BISHOP'S PALACE, ST. DAVID'S. FROM A DRAWING BY H. J. FINN.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

December 21st, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slates; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

SOME interesting facts are to hand as to the condition of Japanese prisons. These buildings are constructed of inflammable materials, are lighted by paraffin, are greatly overcrowded, and are practically destitute of sanitary appliances. A representative deputation of foreigners, who recently inspected two of the houses of detention, found as many as thirteen persons confined in a cell 12ft. by 9ft. The flooring was covered with thin straw mats, and so closely were the inmates packed that it was impossible for them to lie down at night. All the fittings of the prison were of wood, so that in case of fire a grave disaster would be inevitable. A punishment cell had a door so small and so low that it could be entered only on hands and knees. The cell was perfectly dark, and the only ventilation was half a dozen narrow slits in the ceiling. The Japanese are not to be accused of inhumanity. They recognise the antiquated nature of their prison accommodation, and are rebuilding the houses of detention as fast as circumstances permit. But it might have been as well if the European Powers had waited until the rebuilding operations had been completed before assenting to the abolition of the capitulations.

As a preliminary to filling in with mosaic work one of the three vacant spaces in the central hall at St. Stephen's, the panel over the entrance to the corridor leading to the commons lobby has just been opened up for the reception of Sir Edward Poynter's cartoon of St. David. This will immediately face the presentment of St George, by the same artist, which was erected some years ago, and the brilliant colouring of which is always a source of admiration when the hall is lighted. It is expected that by the time Parliament re-assembles in February next the work will have been completed, leaving only the panels to the right and left, in which are to be placed to plate Mr. Albert Moore's designs of "St. Andrew" and "St. Patrick," to be filled in.

At a special meeting of the East Sussex County Council recently, the members had before them a report from the Visiting Committee giving estimates of cost of the new asylum, and another from the Finance Committee recommending application to the Local Government Board for additional borrowing powers, in view of the large expenditure probable during the next few years. The former committee has approved of the preliminary plans prepared by the architect, Mr. G. T. Hine, and recommends that in the first instance accommodation be provided for 1055 lunatics, 60 idiots, with a view to ultimate extension. The cost for the smaller number is

WINCHESTER COLLEGE, CHAPEL, AND CLOISTERS. FROM A DRAWING BY H. J. FINN.

estimated at £267 per bed, a total of £297,582, and for the higher number £248 per bed, equal to £261,602. Unfortunately, space will not permit of our giving the full text of the report of the Asylum Committee.

THE Site Committee's Report contains the following passages: "The Site Committee wishes to express its recognition of the manner in which Mr. Hine has met its views and suggestions. It is much impressed with his determination to make the efficiency of the asylum the chief consideration, having due regard, however, to saving of unnecessary expense. The Site Committee also submits the finished estimates prepared by Mr. Hine, and has the satisfaction of reporting that notwithstanding a large increase in the expense of building since August, 1897, when the committee informed the Council of the probable cost per bed of a complete asylum, the estimates of Mr. Hine do not exceed the limit then given. The total cost, however, will exceed that mentioned to the Council, the

excess arising from the fact that the committee decided, with the concurrence of the Site Committee, to increase the number of patients for which the asylum was to be planned."

AN interesting paper on the lonely group of Caroline Islands, in the South Pacific, was read before the Geographical Society last week by Mr. F. W. Christian, who has recently spent some months there. Apart from their political importance at the present moment, the Carolines have a claim upon geographers and anthropologists on account of the gigantic memorials which they retain of a prehistoric race of builders. In the harbour of Ponape, one of the easternmost islands of the long-drawn-out archipelago, is a group of artificially-constructed islets, forming a perfect Venice of waterways and buildings, known as Metalanim. On these are the tombs of the departed race, walled round with massive structures of columnar basalt stripped from the cliff thirty miles away, and carried across the lagoon.

These ruins, overgrown with masses of dense jungle and creeper, have been known to exist for many years past. They were visited by Admiral Bridges in 1883, and ten years previously by Mr. Woods.

MR. E. J. VAN WISSELIINGH has opened at the Dutch Gallery, 14, Brook Street, Harover Square, W., the first exhibition of Original Wood Engraving. The seventy-one examples in this admirable exhibition are specimens of the work of J. F. Millet, T. S. Moore, William Nicholson, L. Pissarro, C. Ricketts, R. Savage, and C. H. Shannon. The three drawings by A. Legros, engraved by C. Ricketts, are particularly striking. Early in the nineteenth century the use of the graver superseded that of the engraving knife, and this change happened in the hands of an Englishman. Ever since, it has been in England that we find the greatest number of original wood engravers, and, on the whole, the keenest sense of the resources of the medium. The names of Blake, his pupil Calvert, and Bewick, have become household words. The woodcuts collected in this exhibition have been done during the last ten years, which time has been given up almost to process work. Contrary to the popular belief, only two foreign artists can be certainly associated during almost two centuries with an original wood-cutting, namely, Altdorfer the German and Livens the Dutchman. In recent times, Jean François Millet made some experiments with his brother.

MR. A. J. HUGHES, engineer to the Calcutta Corporation, has (says the Times of India) published a pamphlet which is a strong indictment of the sanitation in cities of India. "It has become impossible," he writes, referring to the sanitary conditions of Calcutta and Bombay, "that a civilised Government can continue to permit these great cities of commerce to remain, as they are at present, literally plague spots, in which are fostered, and from which proceed, such deadly diseases as cholera and plague." At the end of the pamphlet he says especially of Calcutta:—"The city is a first-class trading centre, and its sanitary condition is a standing menace to the health of the world."

IN connection with the noble gifts to Derbyshire in the name of the late Sir Joseph Whitworth, Bart., the millionaire inventor, the Duchess of Devonshire has performed the inaugural ceremony of the Whitworth Hospitals, at Darley Dale. This is part of the scheme carried out by the devisees of the late baronet, Mr. Chancellor Christie and Mr. R. D. Darbshire, which has resulted in buildings to the value of £150,000, comprising an institute, a park, and now a couple of hospitals, being handed over to locally-constituted trusts for ever, together with ample endowments.

At a meeting of the Executive Committee of the National Trust, held at 1, Great College Street, Westminster, the question of the ownership of the mediæval well of St. Winifred, at Holywell, Flintshire, was discussed, and it was decided to ascertain in whom the right of taking water from the well was vested. The proposed enclosure of the public recreation ground at Alfriston in Sussex was also discussed, and the chairman (Sir Robert Hunter) said he was advised that the Parish Council had no legal right to enclose the Tye or consent to its exchange for other land. Canon Rawsley read a letter from Herr Zahringer of Lucerne, explaining how the rumour had arisen that the old Kapell Brücke was to be pulled down. The origin of this is that a footbridge was to be built across the Reuss near by it. A letter was enclosed from the chairman of the Town Council of Lucerne, giving an assurance that the old bridge would be in no way interfered with.

ON Wednesday the Metropolitan Tribunal of Appeal had before them a matter under the London Building Act involving the question of the extent of the County Council's authority

over the construction of corner houses in the laying out of streets. Mr. Seaman, the appellant, secured in 1886 the sanction of the Board of Works to a contract by which he became the builder of houses upon freehold property in Mozart Street, Paddington, and under it he now proposed to erect a building at the corner of Mozart Street and Bravington Street. The London County Council, however, decided that under the Act the two frontages of the house must be uniform with the respective streets to which they were adjacent. The view of the builder, however, was that corner houses should be treated as having a frontage in only one of the streets. The Tribunal decided that the house would have to be regarded as being in both streets, and the decision of the London County Council and their superintending architect was upheld.

OUR Peterborough correspondent reports that much interest has been created in that city by the discovery in the yards of the Peterborough New Bricks Company, at Fletton, of the skeleton of a pre-historic animal of prodigious size. The bones were encountered in the clay deposit, nearly 20ft. below the surface of the ground. Mr. A. Keeble, member of a well-known Peterborough firm who have to do with the brickyards named, at once communicated with Major Leeds, of Eye, who is looked upon as a specialist in regard to these fossil remains, and he has been carefully superintending the recovery of the remains. What the discovery really amounts to is not at present definitely known; but local geologists are agreed that it is the remains of some prehistoric monster, which measures some 50ft. from the tip of its tail to its mouth. The tail is 16ft. long, and one of the foreleg joints is 4ft. long and about 2ft. in diameter. If anticipations are verified, the find will prove of great scientific interest, inasmuch as it is thought it may possibly be the first complete fossil remains of its kind yet discovered in the country.

THE old house, No. 19, Fleet Street, another piece of ancient London, will disappear in the course of a few days. Now in the occupation of a hairdresser, the house, which is known as the old Palace of Henry VIII. and Cardinal Wolsey, is generally believed to have been the office of the Duchy of Cornwall in James I.'s reign. It was built by command of Cardinal Wolsey by Sir Amyas Paulet, and it is related that when Wolsey was a young man he had offended Sir Amyas, who promptly had him placed in the stocks. Later on, the house was turned into Nando's Coffee House, and it was here that Lord Thurlow, then an impecunious barrister, picked up his first brief. The workmen have commenced to pull down the house. It is to be rebuilt by Mr. Carter. The most interesting room in the house is on the first floor. It is gorgeously decorated, and contains some very valuable specimens of antique carving. In this room Henry VIII. and Wolsey met on several occasions, and the chair in which the Cardinal sat still stands in the room.

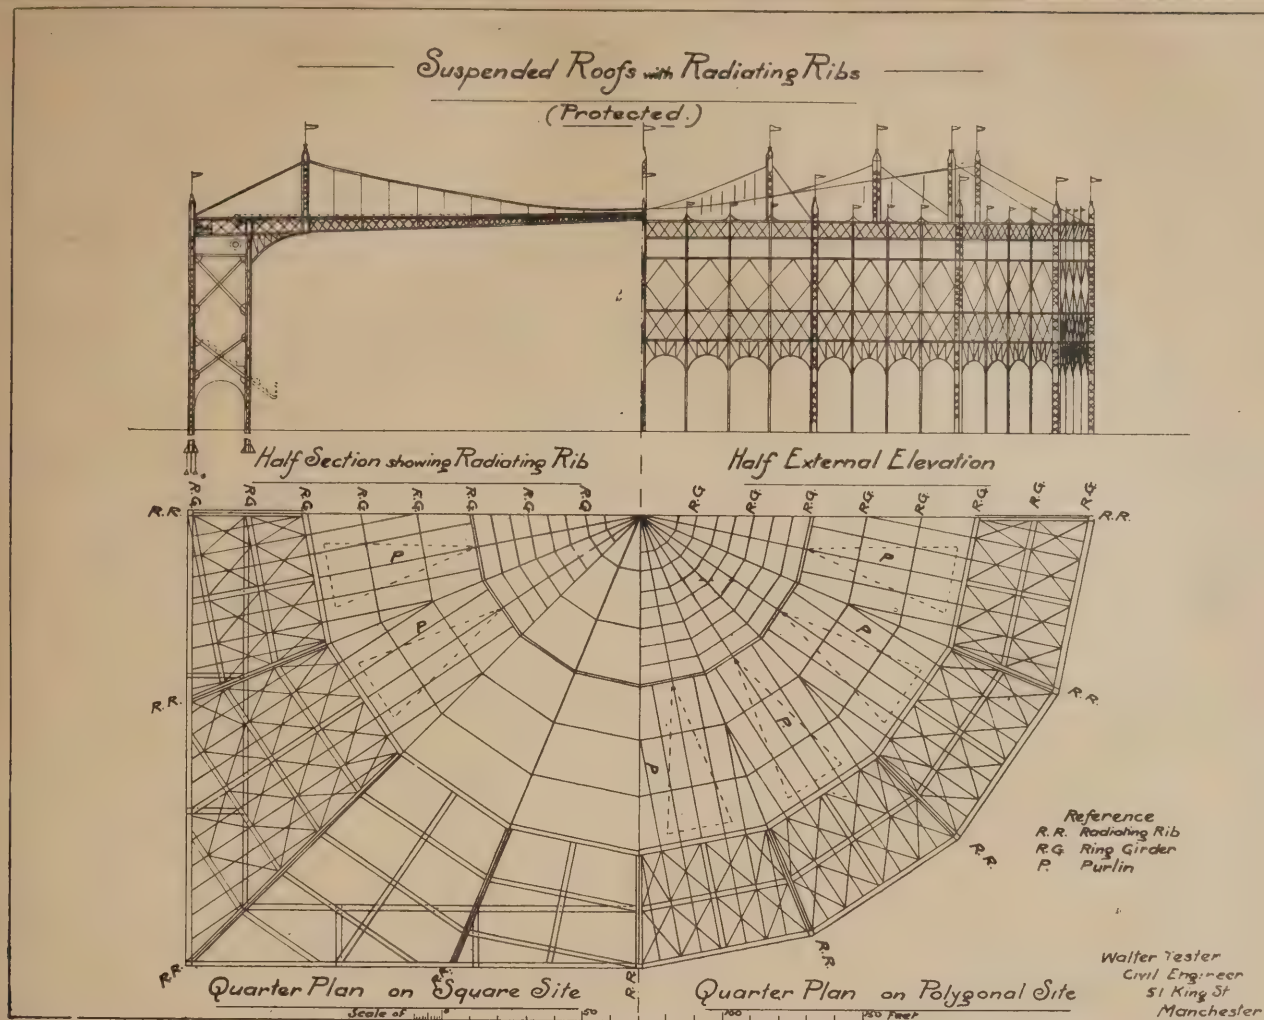

"WHAT gives new hope for the generation to come is that ecclesiastics have arisen with a new sense of the value of living Art, and a small number of young artists have thought it high time to combine to denounce the prevalent taste, and try to serve religious thought with designs of original conception." Such was the pregnant language of Mr. Holman Hunt on the formation of the Clergy and Artists' Association for the improvement of Art in churches, of which Mr. John Ruskin and himself are patrons. The Bishop of Rochester presided over the first conference of the Society at Bishop's House, Kennington, when Mr. Reginald Hallward enlarged upon the difficulties and dangers of Art work in religious edifices. To supply Art on a commercial system was, he declared, next to impossible. An artist, not a house of business, was needed for the production of a work of Art. Quite recently he had seen a dozen churches which had been decorated at large cost, but the expenditure had no relation whatever to the artistic results achieved. The money, in fact, had been thrown away.

Much bad work arose from the carelessness of committees, who allowed personal and local considerations to outweigh the claims of Art. The whole path was paved with commissions, and where that was the case inferior workmanship must not be wondered at. The tradesman's ideal was not high enough, and that association wanted to give the artist's ideal a chance.

PRINCESS LOUISE attended a meeting in Grosvenor House last week in aid of the new building fund of the Victoria Hospital for Children. The Victoria Hospital was founded in 1866 in a famous old mansion named Gough House, but the structural deficiencies of the institution have always militated gravely against the efficient working of the charity. The wards are in inter-communication, the ventilation and the cubic space available for each patient are insufficient, and the means of isolating suspicious cases very deficient. A proposal was made for a new and complete building, divided into wards, to be erected on the ground adjoining the present building, at an estimated cost of £25,000. Affiliated with this excellent institution is a commodious convalescent home at Broadstairs, provided at a cost of over £8400, with accommodation for fifty children.

CONTINUING his course of University Extension Lectures on famous cities at the Cemetery Road Vestry Hall, Professor Anderson took the City of Venice as his subject. He said Venice was once a great sea power, and her dominion was largely in the East. She had a Government Republican in form, but aristocratic in principle, which lasted for eleven centuries, outliving all the dynasties of Europe. Her wealth and power depended directly on trade, and when her trade declined she lost both. Three causes brought about her decline—the conquests of the Turks, the discovery of a trade route round the Cape of Good Hope, and the growth of the kingdoms of Western Europe, which shifted the centre of gravity in commercial matters from Central Europe westward. In our own days, owing to the poverty of Europe, the general revival of trade has scarcely touched Venice, and the shipping of the Adriatic has passed her by, and gone to Trieste and Fiume. Nowadays, she is a tourist resort, a city of the past, where the palaces built more than two centuries ago remain untouched. To Sheffielders the Art of Venice is indissolubly connected with the name of Mr. Ruskin, and in the Ruskin Museum we can gain glimpses of the gorgeous richness of ornament and colour that mark it out from other schools. It was throughout the Art of the wealthy, displayed in churches and palaces built on a grand scale and in grand style. The artists who decorated its ceilings with frescoes and paintings provided its churches with altarpieces, and portrayed its inhabitants, rejoice in showing the pride of rich raiment set off by precious jewels. The forms they choose are those of beautiful women, with all the soft, sensuous gradations of rose and lily shown on a smooth and dimpled skin, with well-rounded arms and luxuriant hair, all speaking of good living and freedom from drudgery. Their men are of the same mould, dignified, resolute, and aristocratic, but without the spiritual air of the ascetic or the weather-beaten, scarred face of the warrior or man of action. The student, as a rule, turns with greater pleasure to the earlier masters, who had not as yet fallen victims to the charms of wealth, and thinks almost regretfully of such painters as Leonards, in whose work the spiritual dominates the temporal. Yet for examples of how a brush, paint, and canvas can render the play of light and shade on rich colours, the whole world of Art turns to Venice, and recognises the supremacy of her great painters—Bellini, Titian, Veronese, and the rest.

A CONFERENCE took place at the Council Hall, Rotherham, last week, between representatives of the Corporation and the Board of Guardians to discuss the proposal for the erection of a sanatorium for the borough of Rotherham.

SUSPENDED ROOFS WITH RADIATING RIBS.

THE accompanying drawing shows a design for large span roofs on the suspension principle. Stiff radiating ribs are hung from steel wire ropes or chains, anchored down to the ground in the ordinary way. Between the radial ribs are arranged parallel ring girders, increasing in depth with their spans, the outer ones being double, and strongly braced together by the steel joist purlins and radial and diagonal bars at top and bottom. The radiating ribs on the polygonal plan rest on and into strong double pillars, braced together in all directions, the outer ones being anchored down.

When the plan of the building is square or oblong, the radial ribs run over inner girders parallel to the outer face and into girders on the face of the building. The inner and outer face girders are supported by double pillars, as before. The top booms of the radial ribs are made channel section, so as to act as gutters to carry the water off the roof, being given sufficient fall for the purpose, and the water is collected in tanks at the outer ends. A large central portion may be made moveable in sections, to slide on rails, with wheels attached to the framing, which is well stiffened, each portion being wound in and out by a windlass and wire rope. In addition, large portions at the circumference can be made to slide in a similar manner, and ordinary small moveable skylights can be arranged.

The roof may be covered entirely or partially with glass (protected with wire netting where required), boarding, or any other ordinary roofing materials. The front of the building may be filled in with boarding, brickwork, &c., or may be left partially open. Galleries can be arranged around the circumference as shown. It is quite practicable on this system to roof in large areas for cricket, football, or athletic sports, racing, &c., for a sum of between £20,000 and £30,000, making the games independent of the weather. It is applicable

to any shape of roof for pavilions, warehouses, exhibition buildings, drill halls, stations, market halls, &c., and is far the most economical form of construction for large spans—saving from 20 to 50 per cent., according to the span, over the arched system. In point of cost it compares favourably, area for area, and height for height, with the ordinary method of covering large spaces by several moderate spans supported on intermediate columns and girders, especially where considerable height is necessary. These roofs can be executed on the suspension principle in one span and can easily be made as lofty as required.

The inventor and patentee is Mr. Walter Tester, Civil Engineer, 51, King Street, Manchester.

"IMPROVING" AN OLD SCOTTISH TOWN.

A REMNANT of seventeenth century antiquity has been obliterated at Burntisland. The improvements which are being carried out at the East Port of the ancient burgh, by the proprietor of the old tenements there, are the suggestion of the Corporation, and provide for a handsome block of buildings, from designs prepared by Messrs. Swanston and Legge, architects, Kirkcaldy, and open up a wider access to the High Street. The property now being taken down includes a portion of the old wall, which formed a simple fortification of the town dating anterior to the Protectorate. Like other Scottish burghs of the period, Burntisland was a walled town, and had a port or gate which was closed at night, and opened in the morning. The wall which has been taken down was erected in 1635, and stretched across the east end of the street, with an arched gateway in the centre. The restricted opening existed at the beginning of the present century, but the gates had disappeared. About the year 1825, when Burntisland began to be used in connection with the Fife and Mid-Lothian Ferry, this gateway was found too

narrow an entrance to the town for the four-horse coaches which at the time were the daily means of communication between the Forth and the Tay. The Road Trustees accordingly approached the burgh authorities, and induced them to consent to their widening the access, promising to substitute something ornamental and worthy of the town. They took down the gateway, put back the wall, and erected two rough square pillars surmounted by round stone balls on the coping, which stand at the present day.

THE ORIGINAL GATEWAY

had no pretensions to architectural beauty. It gave the town a venerable appearance to those entering it from the east, and formed a shelter from the easterly winds as well as from troublesome neighbours. The Town Council of to-day, in desiring to preserve the pillars, look with more affection on them than did their predecessors, who thought that they had been imposed on by the Road Trustees, and refer with quiet sarcasm in their records to the pillars as "showing what were these gentlemen's ideas of handsomeness." Interesting traditions cluster round the East Port and its old wall, now no more, says the Scotsman. On the north side of the arched gateway a public well stood against the wall, which was a rendezvous for the burghers; and it was possible, when the gates were shut, to mount by means of the well to the top of the burgh wall, and observe what was going on outside. On the south of the gateway was a recess in the wall, in which were hung for public exhibition parts of the bodies of persons martyred or "murdered by law" at Edinburgh.

An appeal has been issued on behalf of the church schools at Arundel. These schools were granted and endowed in 1853 by Henry Charles, 13th Duke of Norfolk, and about 1867 they were described by Her Majesty's inspector as some of the very best in Sussex. The Education Department has decided that the premises are in an unsatisfactory state, and that they must be entirely rebuilt.

AN ADDRESS TO ARCHITECTS.*

By MR. FRANK W. RICH, F.R.I.B.A.

(Continued from page 298.)

THE new material, if indeed we are to have one, must have a further quality beyond being fire-resisting; it must be proof against all influences as to wetness or dryness, it must not shrink when the fires are lighted, or swell in a damp building, for, as I have said before, men will not wait nowadays for natural materials to season. How different all this is from the time in which they took to erect the mansions of the time of Elizabeth or James, Burghley, Montacute, Crewe, Audley End, Burton Agnes, and many others, in which twenty years were frequently spent in the erection and completion of these houses; but, then, look at the glorious results! If wood ever ceases to be one of our prime materials in building construction, it will be with a great twinge of regret that we shall part company with it, for has it not been associated with us since time was? Have we not fashioned our dear old British Oak into all the uses of our lives? Do we not look with pardonable pride on its sympathetic grain, as it encases our cosy panelled rooms, and think of its great traditions, immutably bound up with some of the most glorious events in our national history? I do believe, fire-resisting considerations notwithstanding, that

THE OAK WILL NEVER LEAVE US.

There is another circumstance in our practice I must refer to. I allude to the testing of materials. The scope of this subject is endless, as all experimenters know. It is too vast a subject to be undertaken by a private individual, and no Government will undertake it. We have not the advantages that our friends the Civil Engineers possess, in frequently having the wealth of a huge company behind their backs to conduct experiments without limit. No, our works are not of such a colossal size as our friends', and will not justify such an expenditure. How, then, can this thorough, far reaching, and absolutely authentic series of experiments be carried into execution? There are, and have been, men who have devoted much expense and time to these matters, and to whom we are much indebted, but the information is frequently fragmentary, and not easy to reach. There have been no thorough series of experiments for architects on materials in purely architectural construction. The Institute has very lately carried out some experiments, as to the

STRENGTH OF BRICKWORK,

which are most valuable; but I do not think the expense of the system I am now foreshadowing should fall on only a part of the members of our profession—I think a much greater grasp should be taken of the situation. All our building materials, as used in the ordinary building manner, should be subjected to exhaustive tests of every kind, not only with regard to strength or endurance, but also to that "fire resistance" to which I have before alluded. I do not mean that every piece of brick, stone, concrete, wood, or iron should be tested, but sufficient experiments be carried out to establish a reliable data. All this would be a matter of hard facts. There would be no question of design or other debatable ground to interfere with the steady carrying out of this scheme. After we are in possession of the mass of facts such a scheme would bring out, we could, from the knowledge then acquired, design accordingly. And who can tell what school of design or style of Architecture this would produce? But, as I said before, all this will cost money, and it will be a continuing expenditure. I am not going to say who should move first in this matter, or to say how it is to be brought about. I shall leave that to the

COLLECTIVE WISDOM OF THE MEMBERS

of our Profession. All I would suggest is that, in such a scheme, the control should be

in the hands of the Institute, and all members of the Profession, whether members of the Institute or not, all members worth the name, should contribute in annual subscriptions such a sum as to make it worth while for the best men to give us the benefit of their services. I should like, before I finish, to say a few words on architectural practice, and with your permission, to offer a few words of advice. I may have again to use plain language, but, I think, I can rely on your forgiveness. I intend these remarks only for those of our friends in practice. It is, of course, delightful to speak of

ARCHITECTURE AS AN ART,

and of all the glorious traditions belonging to it, when the imagination is floated on ethereal waves of the poetry of Art. But no such angelic existence is vouchsafed to us. The hard fact remains, that we must descend to the ordinary things of life. We have our livings to make. We are not like the chameleon, who was said to live on the air. We have to earn our bread and butter like the rest of ordinary mortals. We all know that the practice of Architecture is about the most ill-paid of all the polite professions. I think we should all do something to remedy this state of things. There are several ways by which this could be accomplished, but all must tend to the same end. We are not blind to the signs of the times. We cannot have failed to observe that nearly all the great captains of industry have lately placed their backs to the wall, and the tendency of the age is all that way. Our friends of the legal and medical professions have had their backs to the wall for a long period, and take care they keep there. But we are yet too much disjointed—too wide apart in our charges.

UGLY RUMOURS

reach us now and then of architects working for half the acknowledged fee, and other shady performances. If there be any truth in these rumours, I should like to advise our "brothers in Art" to be firm, and toe the line, for, depend upon it, cheap services merit their own reward. The public will always place most reliance on services of most value. We are sometimes confronted in our practice with a disaster that may entail investigation in the courts, and we may be called to support or contest, by evidence, the matter in question. Our only straight and open course is to maintain truth and justice, and, if matters terminated there, all would be well. But all who, in any way, have perused the proceedings, or attended the enquiries in the courts, cannot have failed to be struck by the direct conflict of evidence. It is here the professional witness flourishes, and it is here we hear the scathing criticisms of the judges denouncing architects as men beneath contempt. May I again plead that architects stand together not to burk the truth, but to help it? Not to "extenuate or set down aught in malice," or the dire day may come when they themselves are in the same boat, and need their professional brethren's advice. There is yet another matter to which I should like to say a word, I allude to

THE QUESTION OF STATUS.

This is a matter concerning only the ways of the world, but a very important matter to us. We have heard of the judges' opinion of us in the courts, and we know too well the opinion the public form of the profession. Looking to the immense field covered by the profession of Architecture, the important results upon our existence as an educated people, and the life-long study to master it. Is it right, I say, that such an important profession should be belied and in such disrespect? I believe the members have it entirely in their own hands. I have already indicated some lines that would lead to a different state of things. Members will easily perceive others that will lead still further on. The men who employ us are generally wealthier men than we are. Respectability is a potent factor, and, I think I would say, be a gentleman first and an architect afterwards. Let us have no more such definitions as that of the man who said: "An architect is that man who rides first-class at other people's expense, and third at his own."

Professional Items.

ABERAVON.—The sum of £550 has been raised at St. Mary's Church towards restoring the tower. Mrs. Llewellyn, Baglan Hall recently gave £1600 towards erecting a new wing for the same church, which is now in course of erection by Mr. David Jenkins Swansea. The architect is Mr. Halliday, of Cardiff.

LONDON.—A branch of the London Joint Stock Bank Limited, which has been erected on the site of St. Michael's Church, was opened last week at the corner of Wood Street and Gresham Street. The new premises cover a superficial ground area of about 3600ft. About two-thirds of the ground floor, and about one-half of the basement, are in the occupation of the Bank, while the remainder of these floors and the whole of the upper floors will be let as offices, access to which will be obtained by a separate staircase. The new buildings possess a commanding appearance. The front to Wood Street also faces down Gresham Street, from which the façade of the new Bank will be seen to great advantage. It is entirely of Portland stone, the entrance being enriched by Swedish red granite. This façade is a treatment of the Italian Renaissance, and the design includes an enriched stone corbel that enables the clock that for so many years has been a conspicuous object to reoccupy its sphere of usefulness. The counters and desks are of the finest polished mahogany, the electric light has been fitted throughout, and the windows have been furnished with a patent lattice-work shutter which offers ample protection without excluding the light, or preventing the police from keeping a watchful eye upon the premises after business hours. The desks have been equipped with time-saving fittings, the drawers of the cashiers for instance, running on rollers. The manager's room and waiting office immediately face the entrance. There is a special room in the basement for the convenience of the staff, and lavatories. The building, which has been constructed throughout of fire-resisting materials, has been erected from the designs prepared by and carried out under the direction of Messrs. Davis and Emanuel, architects, of 2, Finsbury Circus. The internal fittings have been designed and carried out by Mr. Harrison, the architect to the Bank. It may be added that the substructure was executed by Mr. John Greenwood, builder, of Arthur Street West, and the superstructure by the general contractors, Messrs. Ashby and Horner, 8, Aldgate. Messrs. Dennett and Ingle supplied the iron and steel construction and the fire-resisting floors.

MATLOCK.—The Duchess of Devonshire opened on Wednesday the Whitworth Hospitals, near Matlock. They are the gift of the devisees of the late Sir Joseph Wentworth, the millionaire inventor, and have cost over £20,000. With them there is an endowment of £500 a year in perpetuity. The hospitals were originally proposed by Lady Wentworth, and are part of the great project which has given to Darley and Matlock various munificent gifts, the others being a park and an institute.

SHEFFIELD.—St. Augustine's Church was formally consecrated on Wednesday afternoon by the Archbishop of York. The church has been built subsequent to Easter, 1897. Its early English style and the clean-looking stone of which it is composed make it a fair landmark as viewed from the adjacent roads. The church is 133ft. long, 50ft. wide, and the height of the interior is the same distance. It is well lighted and seated, and the exceptionally broad nave imparts a free and open appearance to the interior. The tower rises to a height of over 100ft. The church is not yet quite completed, as transepts are to be added. There will then be seating accommodation for 750 worshippers, or 100 more than can at present find seats. The architect is Mr. J. D. Webster.

* The inaugural address of the President of the Northern Architectural Association, delivered at the opening meeting of the session 1898-1899, held in Newcastle-on-Tyne.

Under Discussion.

THE A.A.

At the fifth meeting—Mr. H. J. Leaning in the chair—of the Discussion Section of the Architectural Association, held at 56, Marlborough Street, W., last Friday evening, Mr. S. W. Cranfield, A.R.I.B.A., read a paper on "Technical Institutes," in which he described the uses and planning of the Polytechnics or Technical Institutes, referring particularly to those in London.—Mr. Satchell proposed a vote of thanks to Mr. Cranfield, and Mr. E. W. Mountford, the special visitor of the evening, seconded the vote, which was passed with acclamation.—At this meeting it was stated that the Council of the R.I.B.A., in consideration of the Owen Jones studentship for 1898 not being awarded, has awarded a further prize of £50 to Mr. Arthur Edward Henderson, the prizeman of 1897.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

The third meeting of the session was held at the rooms in Sackville Street, on the 7th inst., Mr. Blashill Hoy, treasurer, in the chair. Mr. Badger, of Peterborough, exhibited a silver penny of Offa, recently dug up in Castor churchyard, also a styca of Eanred, King of Northumbria A.D. 808-848. He likewise exhibited some portions of tiles of elaborate pattern with the Tudor rose, recently discovered in pulling down the Angel Hotel, Peterborough. Mr. Irvine sent for exhibition careful drawings of the leaden chalice preserved in the chapter library at Peterborough, and some measured drawings of the coffin lid, or tombstone, lately found in excavating under the diagonal buttress of the "new work" at the Cathedral. A series of twenty very beautiful sepia drawings of antiquities in Boston and the neighbourhood, executed by William Brand in 1808, were also exhibited by Mr. Badger. Mrs. Day showed some rare examples of early printed books, including a real Aldine "Cicero," dated 1592. Mrs. Collier laid upon the table an interesting bronze medallion of Oliver Cromwell and other Cromwellian memorials. Rev. H. J. D. Astley, hon. editorial secretary, exhibited on behalf of Mr. Donally some further graphic sketches of various objects found in the Crannog recently discovered near Dumbarton, showing the construction of the wet dock for the great war cause, and the weird looking objects called totems, carved out of cannal coal, etc. A paper entitled "The Ancient University of Britain" was read by the author, the Rev. W. S. Lach-Szyrma, M.A. He said the question, "Which is the oldest University in Britain?" is one of considerable interest. Modern criticism tends to cast doubt upon the long accepted theory that Oxford is the oldest because it derives its origin from the age of Alfred the Great, while many Cambridge men claim that their University is the elder of the two. With that question the paper was not concerned, but with a far older institution than either of them, for even before the birth of Alfred the Great—there was in Britain a university some 400 years old which, in the time of Alfred, after a long period of usefulness, and being a centre of light to Celtic Britain had already passed its acme, and from political causes was verging to decay. This was the University of Llanilyd Fawr or Llantwit Major, as it is now called. The university was founded in the age of Theodosius II. It was burnt by Irish pirates in 440, but was restored and rebuilt by the Great St. Iltyd, Knight, hermit and teacher, who established it as a seat of light in an age of profound darkness. The students numbered at one time more than 2000, the sons of British nobles, foreign princes, and the youths of various nations, who came for study, rest and peace, from the turmoil of Western Europe in the tumultuous times of the barbarian invaders. The discipline was monastic, the culture, the decaying culture of the old

world, mingled with elements of Christianity and, perhaps, the memories of Druidic traditions and philosophy. For the archæologist, Llantwit at the present day presents one of the most striking groups of British monuments—a museum, as it were, of edifices or monuments *in situ*, including a wonderful Pagan British Altar Pillar, carved over with Celtic ornament and with groove for the sacrificial blood, the menhir of St. Samson, the ancient crosses, and in the churchyard the pillar reared by King Howell in the ninth century, together with monastic ruins and foundations of college buildings, all grouped around the church and churchyard.—In the discussion which followed the paper, Mr. Park Harrison raised the question as to the language spoken in the university, and was understood to suggest that the institution should not be regarded as a university in the modern acceptance of the term, but that the word *Schola* would more accurately describe it.

EDINBURGH ARCHITECTURAL ASSOCIATION.

A meeting of the Edinburgh Architectural Association was held on Wednesday evening last in the Royal Institution, Princes Street.—Mr. Thomas Ross, the president, occupying the chair. The Chairman, referring to the death of Mr. Hamilton Beattie, said he was one of the oldest members of the Association, having joined so far back as 1861, and was president for session 1866-67. Mr. Beattie, in his public capacity, had a very difficult duty to perform, requiring tact and knowledge of men. To say that he pleased everybody would be paying his memory a poor compliment, but he (the Chairman) had every reason to believe that the difficult services he rendered to the town were highly appreciated by the Magistrates and Town Council. He was making for himself a great name in the Profession, and, especially in all questions relating to property, his advice was sought for far and near. There appeared to be before him a long life of professional prosperity and usefulness, when, without a moment's warning, he was taken away, to the grief of all who knew him. He proposed that a letter of condolence should be sent to the family of Mr. Hamilton Beattie, and this was agreed to.—Mr. Edwin Forbes then delivered a lecture on a year's work in Galloway in connection with the School of Applied Art Studentship, which had been gained by him. After stating that it was scarcely possible to over-estimate the boon which the School of Applied Art was to those who had chosen Architecture as their life-work, he proceeded to describe Dundrennan Abbey, Glenluce Abbey, Lincluden College, Sweetheart Abbey, and Caeraverock Castle, giving history, traditions, and dates in connection with each of these buildings.—The lecture was illustrated with limelight views.

BAD VENTILATION.

The mystery of bad ventilation which from time to time is heard of from the Houses of Parliament, like an evil spirit that defies conjuration, was recently explained quite simply to the Institute of Civil Engineers by Mr. Francis Fox. It is no mystery at all. True, the system is elaborate, providing for the extraction of vitiated air by furnaces in the roof and the admission of pure air through cotton wool, though not in sufficient quantities. But the pure air in question, after this very careful treatment, ascends through open matting on the floors, on which everybody wipes off the mud and dust from his feet. That sufficiently accounts for the influenza epidemics, and even for certain cases of blood poisoning in the servants of the House. But as for the corridors, they are not ventilated either one way or the other. Mr. Fox affirmed that, although it would be costly to remodel the whole system, it is possible vastly to improve it even before Parliament meets again—by altering the position of the admission grids and supplying all committee-rooms with quick-running electric fans. Worse ways of stimulating Her Majesty's Opposition to the transaction of business have been tried.

Enquiry Department.

A POINT IN PRACTICE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I shall be extremely obliged if you will kindly help me in the position as stated above. A gentleman tells an architect he is prepared to speculate in housebuilding if plans are forthcoming, the cost of erecting such buildings to be such as to yield at least 6 per cent. The architect accepts the terms and produces absurd plans which would only yield less than 3 per cent. Naturally the client refuses, and the architect coolly sends in an account for 1½ per cent. commission on the estimated cost. Has he any legal right to this or any other payment therefor?—Thanking you, I remain, yours truly,

X.

Stroud, Gloucestershire.

If the architect undertook to prepare plans for a building which should return a fixed percentage to the investor, and failed to fulfil his contract, he can have no legal claim for payment.

CARPENTRY & JOINERY EXAMINATION.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you kindly inform me (1) What book will cover the whole of the course (and that only) required for the ordinary grade examination in carpentry and joinery held by the City and Guilds of London Institute? (2) If there is no book covering this course exclusively, can you mention a work that will direct my studies into the proper channel without covering much unnecessary ground?—Yours truly, "STUDENT."

We would suggest Allen's "Building Construction." It covers a good deal more than the necessary ground, but it is easy to see what to omit.

COTTAGE BUILDING.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Your correspondent who wrote asking for a book on Cottage Building might read with advantage a work entitled "Sketches of Village and Estate Buildings," by James Williams, architect. It is published by Macmillan and Co. at 16s.—Yours, &c.,

R. K. J.

BRICKS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Could you inform me of a reliable and cheap work on "Brickmaking?" Thanking you in anticipation, yours truly,

Bostal Hill, PERCY N. DANIELS.
Whitstable,
Kent, November 28th, 1898.

We advise you to get E. Dobson's "Treatise on the Manufacture of Bricks and Tiles," or C. T. Davis' "Practical Treatise on the Manufacture of Bricks, Tiles, and Terra Cotta." The Article, "Bricks and Tiles," in Gwilt's "Encyclopædia of Architecture," affords an excellent epitome of the various methods of manufacture.

INTRODUCTION TO ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly let me know of any book on Architecture that would be useful to me for discriminating various classes of same, with illustrations. I am often at a loss to know what period many styles I see in my journeys belong to.—Yours truly,

"NORTH LONDON."

We can recommend any of the following books as affording a good general introduction to the study of Architecture: Tarver's "Guide," Mitchell's "Manual," Statham's "Architecture for the General Reader," Smith and Slater's "Classic and Early Christian Architecture."

Views and Reviews.

FIRE TESTS.

An interesting and profusely illustrated report of experiments carried out by the Committee on Fireproofing Tests in New York, edited by Mr. Edwin O. Sachs, has been recently published. The most important test was tried on a cast-iron column, with a jet of water thrown upon it through a $\frac{1}{2}$ in. nozzle. The column was first raised to a heat of 775 deg., and then cooled by water without injury. The heat was then slowly raised to 1075 deg., and the column, which then glowed with a "dull redness," was again cooled by water. Lastly, the column was heated up to 1300 deg., when it was again drenched with water. The column began to bend just before the last application of the water. The column was apparently unaffected by water, although it failed by bending under the load. The book is made more interesting by the capital illustrations and diagrams.

"Fire Tests with Unprotected Columns." Edited by Edwin O. Sachs. British Fire Prevention Committee, London.

LEADLESS GLAZES.

Mr. W. J. Furnival, the author of this excellent book, has endeavoured to assist in the solution of a complex trade problem. He submits not only the results of his own experiments, but also those of other investigators in similar subjects, hoping thereby to see the speedy general adoption of non-poisonous glazes and aiding the advance towards more hygienic methods of manufacture. The whole subject is exhaustively treated, and we should strongly recommend all interested in the work to at once obtain a copy of the book. The printing is good, and the type used clear and readable, paper excellent.

"Researches on Leadless Glazes." By William J. Furnival, Silver Medallist of the City and Guilds of London Institute for Pottery and Porcelain. W. J. Furnival, 16, Granville Terrace, Stone, Staffordshire. Price 5 guineas.

It is proposed to restore St. Mary's Church, Chelmsford, at a cost of £3500. It was stated at a recent meeting that part of the roof was too bad to be repaired.

A HANDSOME wrought-iron chancel screen has been erected in the parish church, Kelvedon Hatch, by Mrs. Puxon. The screen has been made by the Upton Park Metal Works, under the superintendence of Mr. J. B. Tompkins, and is a good example of highly ornate English ironwork.

CONTRACTS OPEN.

CITY of HULL TRAMWAYS.

CONTRACTS Nos. 16, 20, and 21.
TO ENGINEERS, BUILDERS, AND OTHERS.
The Corporation are prepared to receive TENDERS for the following WORK in connection with the Tramways, viz.:—

Contract No. 16.—Pipes and Fittings for Power Station, and Condensing Main from Dock.

Contract No. 20.—Builder's Work for Two Car Sheds and other Buildings (area about 4000 square yards).

Contract No. 21.—Steel Roof Trusses, Steel Columns, &c., for above Car Sheds.

Forms of Tender and other particulars may be obtained from the City Engineer. A deposit of £1 for each contract will be required in respect of the forms of Tender, &c., for Contracts Nos. 16 and 21. The Deposit will be returned on receipt of a bona-fide Tender.

In case of Contract No. 21, Tenders from firms who would not construct the trusses at their own works will not be considered.

A limited number of the blue prints of the plan for Contracts Nos. 16 and 21 will be supplied on payment of 1s. each Contract (not returnable), but the Corporation do not undertake to supply all applicants.

Remittances to be made payable to Mr. T. G. MILNER, City Treasurer.

Tenders, endorsed as directed on the form of Tender, are to be addressed to the Chairman of the Works Committee, and delivered at the Town Clerk's Office before NOON on FRIDAY, DECEMBER 30th, 1898.

The Corporation do not bind themselves to accept the lowest or any Tender.

By order,
A. E. WHITE,
Town Hall, Hull,
December 12th, 1898. City Engineer.

TO BUILDERS.

The Asylums Committee of the Worshipful Company of Watermen and Lightermen of the River Thames invite TENDERS for RENEWING the DRAINAGE SYSTEM and for other SANITARY and sundry WORKS and REPAIRS at the Royal Watermen's Almshouses, Penge, S.E.

Persons desiring to Tender may obtain bill of quantities and form of Tender upon application to Mr. LOUIS JACOB, Architect, of 423, New Cross-road, S.E., and depositing with him the sum of Three Guineas, which will be returned to persons sending a bona-fide Tender.

Tenders must be signed, sealed, and delivered to me at the Hall on or before SATURDAY, DECEMBER 31st, 1898.

The Committee do not bind themselves to accept the lowest or any Tender.

LOUIS S. WHITE,
Clerk to the Company.

Watermen and Lightermen's Hall,
No. 18, St. Mary-at-Hill, E.C.,
November, 1898.

CONTRACT No. 1.

TO BUILDING CONTRACTORS.

Persons desiring of TENDERING for the CONSTRUCTION OF CONCRETE FOUNDATIONS, the ERECTION OF BRICK, STEEL, and CONCRETE SUPERSTRUCTURES OF NEW INFIRMARY WARD, SANITARY BLOCKS, BOILER HOUSE, TAIL CHIMNEY SHAFT, and SUNDRY OTHER WORKS connected therewith, at the County Lunatic Asylum, Knowle, Fareham, may see the plans and specification and obtain bills of quantities and all other information on application at the Office of Mr. W. J. TAYLOR, County Surveyor, The Castle, Winchester, between the hours of NINE a.m. and FIVE p.m. SATURDAYS between NINE a.m. and ONE p.m.

A deposit of one Ten Pound Bank of England Note will be required for each bill of quantities and will be refunded on receipt of a bona-fide Tender.

The foundations are to be commenced in FEBRUARY, 1899, and the superstructures in MARCH as the weather may permit.

Tenders, strictly in accordance with forms supplied by the County Surveyor, to be delivered to me on or before MONDAY, JANUARY 16th, 1899.

The Committee of Visitors do not bind themselves to accept the lowest or any Tender.

JOHN R. WYATT,
Clerk to the Committee of Visitors.
Knowle,
November 30th, 1898.

VESTRY of ST. MARY, ISLINGTON.

TO BUILDERS.
The Electric Lighting Committee of the above mentioned Vestry is prepared to receive the names and addresses of Builders desirous of TENDERING for WORK in connection with the ENLARGEMENT of the ELECTRIC LIGHTING STATION, Eden-grove, Holloway, N. (near Holloway Station, Great Northern Railway), according to plans which have been prepared by the Vestry's Architect, Mr. A. HESSALL TILTMAN, F.R.I.B.A., 6, John-street, Bedford-row, W.C.

Such names and addresses, enclosed in envelopes, endorsed "Application to Tender," must be sent so as to reach the undersigned not later than FIVE p.m. on WEDNESDAY, DECEMBER 28th, 1898, and reference should be made to works already executed.

Bills of quantities will be supplied, when ready, such firms the Committee may select.

WM. F. DEWEY,
Vestry Hall, Upper-street, N.
December 15th, 1898. Vestry Clerk.

PARISH of ST. GEORGE, HANOVER-SQUARE.

TO CONTRACTORS AND OTHERS.

Such persons as are willing to CONTRACT with the Vestry of the said Parish for the following WORKS and MATERIALS for One Year, from MARCH 25th, 1899, viz.:—

Supply of Guernsey Granite and other suitable Granite or stone.
Masons' Works.
Supply of Paving Materials.
Supply of Hogging.
Supply of Bess Brooms.
Supply of Drain Pipes.
Oil and Candles.
Ironmongery, Steel, and Files.
Paints and Painting Materials.
Lime and Cement.
Timber.
Coals and Coke.
Supply of Uniforms.
Hire of Horses and Carts.
Repairs to Hose Pipes.
Thames Ballast and Sand.
Lamp Columns and Cast-Iron Works.
Lamps, Gas and Gas Fittings.
Printing and Bookbinding.
Books and Stationery.

May deliver in proposals, sealed up, at the Vestry Hall, Mount-street, Grosvenor-square, W., on or before ONE p.m. on SATURDAY, DECEMBER 31st, 1898.

Persons Tendering are desired to take notice that all proposals must be made upon, and strictly in accordance with the printed forms of Tender, to be obtained either at the Vestry Hall, Mount-street, or the Parish Offices, No. 1, Piccadilly-road.

Further particulars may be obtained on application to Mr. G. LIVINGSTONE, Surveyor, at the Parish Offices, No. 1, Piccadilly-road, any morning between the hours of NINE and ELEVEN o'clock.

Contracts to be prepared by the Parish Solicitors at the expense of the Contractors, and the Vestry do not bind themselves to accept the lowest or any Tender.

By order,
T. N. NESBITT,
November, 1898. Vestry Clerk.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to

Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

MUNICIPAL ABATTOIRS.

IT is probable that the County Council affords the nearest approach to complete municipal government which London is likely to receive for the present. No one who desires to avoid injustice to its critics will deny that their work has been well done, and in some cases, perhaps, a trifle overdone. In spite of adverse criticism, however, the Council still exists, and still persists in the endeavour to carry out many much needed reforms. Amongst other subjects now under deliberation, one involving the adoption of public slaughter-houses is not the least either in importance or desirability. In times of arcadian simplicity, unsound or diseased meat would hardly form a constituent part of the ordinary dietary, because even assuming that tuberculosis and other disorders had then been invented, no one would be likely to inflict unwholesome food upon himself or upon his friends. Concurrently with the growth of civilisation and with the development of complex social ramifications, it is to be feared that the sense of personal responsibility in many directions has become undesirably attenuated. The financier who would hesitate to profit knowingly by the losses of his friends, is, nevertheless, usually gratified by the successful issue of a Stock Exchange operation, where the losers possess no apparent personality. Similarly those providing meat for markets, and especially for foreign markets, are exceedingly apt to find more interest in financial than in hygienic considerations. This aspect of the question has not been overlooked, notably by some foreign Governments, who not only insist upon the establishment of public slaughter-houses of the most approved description, but also upon the efficient inspection and marking of meat by qualified officials before it is offered for sale.

Several cities in Great Britain already possess excellent institutions of the kind, but Parliamentary powers are insufficient to provide for compulsory use. Consequently, private slaughter-houses of a very insanitary nature are frequently found in the midst of densely populated districts. Again, no obligation at all rests upon the trader with regard to inspection. Only two safeguards exist, conscience possessed by the butcher, and sporadic zeal exhibited by the inspector. As long ago as the early part of last year, the Public Health Committee of the London County Council were instructed to report "as to the desirability of establishing public slaughter-houses throughout London, and as to the facilities which such a system would afford for the better inspection of meat supply. Careful inquiry has consequently been made by the medical officer, whose report, presented last summer, recorded the fact that large quantities of diseased meat are regularly received in London, and urged that an adequate system of inspection is necessary for the protection of purchasers, and especially for the protection of the classes who purchase the cheaper kinds of meat.

Adequate inspection, under existing circumstances, is difficult, not to say impossible, as will readily be appreciated when it is remembered that there are some 450 private slaughter-houses in London, where between 10,000 and 11,000 animals are killed weekly, in addition to those dealt with at the City of London establishments at Deptford and Islington.

In advocating disestablishment as applied to private slaughter-houses, the medical officer very properly brought forward practical suggestions with the view of affording every convenience for butchers in making use of the proposed abattoirs to be equipped by the County Council. Further, the medical officer anticipated that "when butchers have learnt by experience the conveniences they will enjoy from the use of the slaughter-houses and cooling rooms in connection, these places will provide an acceptable alternate for private slaughter-houses."

At a recent Council meeting opposition, on behalf of the butchers of London was offered to the adoption of the report, but this is by no means surprising, for even if no other argument can be urged against any reform

there is always the objection to a new thing, that it is new.

London butchers, however, have another and newer reason. Like every one else in these days, they appear to be students of science, and if their argument is somewhat specious, it must be excused on the score that they are handling unfamiliar weapons. By the mouth of their representative in the Council the worthy butchers of London inaccurately contended that the consumption of foreign meat is responsible for the growth of anæmia amongst the people of England. Anæmia as a complaint is more likely to afflict the under-fed purchaser than the well-nourished purveyor. If foreign meat can be universally obtained under conditions pre-excluding the possibility of other and more deadly diseases, it is highly probable that the public will buy it and risk the anæmia. This, perhaps, is just what the butchers do not wish, but after all the health of a nation is too priceless a gift to be risked for the benefit of trade interests, and it is to be hoped that the inhabitants of London will duly appreciate urgency of this subject, and will join in supporting the application which will doubtless be made for further Parliamentary powers.

Besides the County Council, Parliament has also devoted some attention to the question of meat supply. The Report of the Royal Commissioners presented this year contains recommendations which appear drastic, but they simply represent regulations similar to those already found necessary in other countries, and which must inevitably be adopted here if the matter is to be dealt with effectively. Of course the question arises as to whether the establishment of public abattoirs and inspection stations will involve increased cost to the ratepayers. Naturally much will depend upon circumstances such as the position of sites and other local considerations. As to the buildings, it will be necessary for architects to make themselves fully conversant with the facilities furnished in places where such establishments already exist. Some of these have already been fully described elsewhere in our columns. In many Continental cities public abattoirs have been found to be financially successful, but this condition is scarcely likely to be fulfilled unless powers are granted for the compulsory closing of private slaughter-houses. In any case it should be borne in mind that the primary consideration is that of public health, rather than of profit, and the question generally is one deserving of immediate attention, not only from governing bodies, but from the community at large.

THE Great Northern Railway has recently obtained a remarkably successful result in some artesian boring operations they have had carried out at Werrington, near Peterborough Station, by Messrs. Le Grand and Sutcliffe, of London.

STEPS are being taken for an immediate resumption of the restoration of the great west front of Peterborough Cathedral. The south-west angle is to be treated in the same manner as the north-west, so far as restoration may be found to be necessary.

THE Painters' Company offers a travelling studentship of fifty pounds for the encouragement of the study of decoration. It is open to competition by students between the ages of twenty and thirty-five, in any recognised school of Art or other institution devoted to the study of applied art in any form, and situate within the limit of the larger metropolitan postal area. Particulars may be obtained from the clerks at the Painters' Hall, 9, Little Trinity Lane, E.C.

THE new Infectious Diseases Hospital, Burnley, for the Burnley Joint Hospital Board, is nearing completion. It is being erected from the designs and under the supervision of Mr. F. S. Button, M.Inst.C.E., civil engineer, Burnley. The whole of the wards are being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves, with descending smoke flues, Manchester grates, exhaust roof ventilators, and special inlet panels.

BACTERIAL TREATMENT OF SEWAGE.*

By GEORGE THUDICHUM, F.C.S.

(Continued from page clvii.)

PRACTICAL points requiring further investigation, and which can be elucidated only by the co-operation of engineers and more especially of borough surveyors, are the questions relating to the trapping of sand, the duration of the working life of the coarse beds, and the degree of fineness necessary for the screens. In the case of the septic tank process the last named requires no consideration, as everything that is organic may be permitted to enter the tank. The sand question, however, remains, and the study of the life of a bed is passed on, though in lesser degree, to the fine beds, since the effluent from the septic tank, taking Exeter as an example, contains considerably more suspended organic matters than that from a coarse bacteria bed. The duration of the active and useful

LIFE OF A COARSE-GRAIN BED

has not yet been determined; the original one at Sutton, which commenced working over two years ago, being still in excellent condition, and treating its proportion of crude sewage daily with results equally as good as those obtained after it had been in operation a couple of months. But certain important observations have been made which tend to show that the water capacity of a bed diminishes according to the time during which it is kept at work; increasing again when rest is allowed, but never equalling that of the bed in its early stages. A considerable portion of this loss in capacity is no doubt due to organic growths in the interstices of the material, and until a certain amount of such has taken place, the purifying powers of the bed are not fully developed. But there must also be a quantity of

MINERAL MATTER

from the sewage deposited in the bed, and much of this can never be brought into solution and thus carried away with the effluent water. Intimately connected with this question is that of trapping the actual sand carried by the sewage, and so preventing it from getting into the bed. This is not of very great importance in the case of towns provided with a separate system of drainage; but where such does not exist, and the water from the roads is removed by the same channel as that which carries the sewage proper, it assumes proportions which on some occasions are startling. This can be well seen by any one at the Barking Outfall Works, where there are thousands of tons of road sand which has been removed from the precipitation channels, having subsided almost as soon as the sewage had passed the penstocks into the channels, and had therefore ceased to flow at a high speed. The amount of such sand brought down and deposited after a single thunderstorm following a period of drought is some hundreds of tons. It is, of course, obvious that this could not be permitted to pass

ON TO A BACTERIA BED,

as the choking up would only be a matter of a relatively short time; and the question to be solved is, to what rate must the flow be reduced, or how long must the sewage be quiescent in settling tanks, in order that the sand may be deposited and the organic matters in suspension left. Too short a period will allow sand to enter the bacteria bed; too long a one will permit of the subsidence of organic matter, which will result in the production of sludge, a product by all means to be avoided. The life of a fine-grain bed is, of course, not affected by similar considerations. The coarse-bed effluent which passes on to the fine contains only a small amount of suspended solids, principally organic, and silting up of the fine bed would not occur. A certain amount of loss of water capacity, due to

* A paper read before the Society of Engineers on Dec. 5th, 1898.

growth, always takes place; but when the point of highest efficiency is arrived at, the capacity remains practically constant. An important point in connection with sewage treatment by any method is to minimise the attention required. In many recent cases where the Sutton system has been adopted attendance during the night hours has been dispensed with by providing a pair of beds, coarse and fine, each having a water capacity sufficient to take the whole of the night flow. Syphons are provided, so that if, owing to rain or other cause, the level of the water in the bed exceeds a certain height, it is automatically discharged from the coarse bed into the fine, or from the fine on to the land. For dealing with the

SEWAGE FROM A SMALL COMMUNITY,

such as a public school or an asylum or a small hamlet, one of two biological methods may be employed, according to the fall available. In the first method, which may be either on the lines of the Sutton or of the septic system, or a combination of the two, the sewage is passed continuously through the tank or for twenty-four hours on to a coarse bed, and then on to fine beds, where it remains for two hours and is then discharged. If bacteria beds only are employed, they should be four in number, viz., two coarse and two fine grain, each being of sufficient capacity to take a whole day's flow. The sewage, or the overflow from the cesspit where such exists, is allowed to pass into one of the coarse beds for twenty-four hours, and is then diverted to the second bed, the effluent from the first being discharged into the corresponding fine bed. Here it is allowed to remain during two hours, and is then finally removed. By this method there is no doubt far more anaerobic action in the coarse bed than is the case when the system is worked normally; but the rest, which is given every alternate day, gives an opportunity for the

DESTRUCTION BY OXIDATION OF THE ORGANIC MATTERS

retained by the bed. The attendance required is very slight, and can be readily given by a gardener; it consists merely in turning a few valves, with an interval of three hours between the first and second operations, and in an occasional raking of the surface. If the fall be sufficient to admit of the employment of two sets of beds, the septic tank and the fine beds only can be employed; and in this case the alternating gear used with the latter is essential, as otherwise the attendance would prove a severe tax. In the second method it is presupposed that the sewage cannot be delivered at or sufficiently near the surface to be passed on to a bed. In this case the best plan is to provide a storage tank, a coarse-grain and a fine grain bacteria bed, each of the three being capable of containing the sewage of an entire day of twenty-four hours. At a fixed time on each day the sewage should be pumped from the storage tank into the coarse bed, should remain there two hours and then be passed into the fine bed, and after a similar period of rest in the latter be finally discharged.

THE SEWAGE FROM THE CLAYBURY ASYLUM of the London County Council has been treated by a single pair of coarse-grain bacteria beds with perfect success for over three years. At Radly College an installation has recently been completed, in which the overflow from a cesspit is treated by two pairs of beds, viz., two coarse and two fine grain. These beds are constructed by excavating, the sides being of brickwork and the bottoms of clay puddle. The coarse beds are 16ft. by 10ft. by 3ft. deep each, and the fine 16ft. by 12ft. by 3ft. deep each. The bed material is coke, that in the coarse beds being all rejected by a screen having a $\frac{1}{2}$ in. mesh, and that in the fine having all passed a mesh of $\frac{3}{8}$ in., with the fine dust removed. The water capacity of each bed is 160 cubic feet, that being the maximum quantity of sewage which they have to deal with daily. It is a source of much gratification to the author that further experience has caused no alteration of the views expressed by him in the paper read before the Society two years ago regarding general principles and

methods of working. Much additional knowledge has been gained, and the applications of the bacterial method have been shown to be of wider scope than was at that time generally recognised; but the facts then related still form the basis on which such knowledge is founded, and the theories set forth have been only amplified and verified, without suffering any integral change. The method of working the beds, by alternately filling and emptying, allowing them to stand full for a limited time, and empty for as long a period as possible, has been proved over and over again to be the correct one. Where the method of constant flow through a filter is employed, the results have so far not been shown to be satisfactory. In many instances, as, for example, at Wimbledon, the effluent escapes from the burnt ballast filter, surface-choked and—being cut off from air by its covering of earth—in a semi-putrid and stinking condition. This fact was noticed by many members of the Society of Municipal and County Engineers on the occasion of their visit to the farm. Whatever be the first treatment, the final purification must be aerobic; and, so far as the author has yet seen, this is best accomplished on the lines laid down as a result of the Barking experiments between 1892 and 1896.

THE SEAFORD WATER QUESTION.

A MEETING of owners and ratepayers was recently held for the purpose of passing a resolution authorising the Seaford Urban Council to join with Newhaven in promoting a Bill to Parliament empowering the Councils to purchase compulsorily, or otherwise, the undertaking of the Newhaven and Seaford Water Company. Mr. E. J. Gorrington presided. The formal notices having been read, Mr. E. J. Gorrington moved the resolution, and gave a resume of the previous proceedings in connection with the last Bill. The Water Company took every technical objection they could. After the Bill was thrown out, the Councils opposed the Water Company's Bill, with the result that they obtained the insertion of a purchase clause.—Mr. Jack seconded the resolution, and made an exhaustive financial statement, putting the total cost of acquiring the Water Company at £66,000. The present Parliamentary costs of the united districts amounted to £3200, and if they did not go on they would have to pay a special rate of 2s. 3d.—Mr. Hutchings said he would prefer to pay that rate, and have done with the matter.—Mr. Jack: That is only one opinion. Having lost £3200 the Council now said if they did not go on they would have to pay a 2s. 4d. rate.—Mr. Hooper also spoke, quoting the case of Brighton, which, by having the control of its own water, saved in thirty years £70,000.—Mr. W. Lambe said he had a small interest in the Water Company, and he did not like partnership with Newhaven. He ridiculed the idea that Newhaven would go on with a Bill without Seaford. He referred to Mr. Hooper's statement as to the time and trouble he had given to the matter, and as to the enthusiasm he had in the matter.—Mr. Lambe was proceeding to condemn the way the public business was conducted, saying there were other things besides water that wanted attention, when he was ruled out of order by the Chairman.—The resolution was then carried, about half-a-dozen voting against it out of about 200 present.

THE tender for the erection of a fish market at Cardiff has been let to Messrs. E. Turner and Sons for £12,988.

ONE of the samples of water recently submitted to Mr. C. E. Cassall, the Kensington public analyst, is declared, in a report laid before the Kensington Vestry, on Wednesday last, to be unfit for the public supply and drinking purposes. The vestry has a sample of water taken, every month, from each of the three companies which supply the parish, and the sample which has just been declared unfit for drinking purposes was from one of the principal mains supplying the district.

LONDON'S WATER SUPPLY.

FURTHER evidence was given before Lord Llandaff's Commission at the Westminster Guildhall on Wednesday in opposition to the project of the County Council to supply the Metropolis with water from Wales. Mr. Walter Hunter, one of the joint engineers of the Staines storage scheme of the London companies, was re-called, and having stated, in reply to the Chairman, that in his opinion the Welsh scheme was not needed at present, he was asked by Mr. Porter whether he thought it desirable to secure an area in case of necessity arising hereafter. That, said the witness, would be going almost beyond an engineering opinion. It might be desirable in the interests of London to secure an area on the supposition that it might be wanted hereafter. It depended upon the growth of London. Some people thought that London would not increase in the future as it had in the past, and therefore that the Welsh water would never be wanted at all. The view he took with regard to the utilisation of the Thames in preference to taking water from a distant watershed might be summed up somewhat in the following way: "We have a river which has an average flow of something like 1,300,000,000 gallons a day. It is suggested that we should go to Wales and open up a supply from a watershed, which, according to the calculations of the County Council, would afford at most 415,000,000 gallons a day. Therefore, it has always seemed to me from the original intention of the promoters of the Welsh scheme, which was to

DISCARD THE THAMES

altogether, that what would happen would be that the 415,000,000 gallons a day would be used up within a certain period, and after having incurred all the expense of bringing the water from Wales, they would have to come back to the Thames, which previously they had affected to despise, and make up the additional water which would then be wanted from the Thames. I have always felt that it was chiefly a question of expense as between the two schemes, and that if the Thames could be developed and give good water at less expense, it was absurd to go to a distant watershed until you were compelled."—Cross-examined by Mr. Balfour Browne, Q.C., on behalf of the London County Council, Mr. Hunter admitted that he knew of nothing better than the Welsh scheme, if the supply of Thames water became exhausted.—Sir Frederick Bramwell, asked by the Chairman whether he considered the purchase of the undertakings of the Water Companies by one or more authorities was financially expedient, gave it as his opinion that it was not expedient that the Companies should be acquired, either in the interests of the water consumer or in the interests of the ratepayer, because he was convinced that the purchasing authority could not afford to make

LESS CHARGE FOR WATER

than was now made. That being so, there would certainly be no saving to the consumer, and as regards the ratepayer getting any benefit out of the transaction, that was extremely problematical. He did not see where economy of management was to come in, because London was so vast that in the case of not one of the eight companies was the management in excess of that which was needed for the population. The officials would have to be equally numerous, or the work would be worse done, and they would have to be equally well paid. The only saving he could foresee was in the shape of directors' fees, which, however, only amounted to 1-1-3 per cent. of the total receipts. He believed that a supply of 35 gallons of water per head per day was ample for the population of London, and under a continuance of the existing management he did not anticipate extravagance in the use of water similar to what he had seen in New York, Philadelphia, and other American cities. When the case of the East London Company, and the way in which they had been treated, came to be inquired into, he believed they would be entirely exonerated.

PARIS ABATTOIRS.

By R. STEPHEN AYLING, A.R.I.B.A.

(Continued from page cxvii.)

FACING the fountain, and in the centre of the site is the auction market (Fig. 34) for the sale of dead meat, J. It has a basement under the whole building for the storage of carcasses, and at the end nearest the entrance gates is a well-designed clock tower.

The building is lighted by a series of windows above the covered verandahs on the two long sides. The roof is in iron and wood, with red tiles. Fig. 35 shows the interior fittings on which the carcasses are hung for sale. At the sides of this market are two small buildings, K and L, the former being residences for employes, and the latter station for the firemen and Republican Guard.

When necessary, it is proposed to erect the two ranges of buildings as shown along the Rue Brancion and Rue de Dantzic, which would give the following accommodation: M M, residences for employes; N N N N, bouveries and bergeries; O O, killing courts and echaudoirs; P P, workshops for the preparation of intestines; Q, condemned meat and sanitary inspector; R, scavengers and disinfectants.

(To be continued.)

AN UNSOLVED PROBLEM.

THE BOUNDARY STREET ESTATE.

THERE are many who remember the district which used to be called "back o' Shoreditch Church," and which a writer lately christened the "Old Jago." Ten or twelve years ago it had a worse reputation than any other neighbourhood in London; it retained its disrepute long after Ratcliff Highway had been made passable. It was very near the main street—so near that one might have flung a stone from Shoreditch High Street or the Bethnal Green Road into the middle of it. But down the narrow passage, set across with posts, and called "the Pasties," which gave entrance on one end to Old Nicol Street, no respectable person—and the

police only on rare occasions—ever ventured. Its real name was not the "Old Jago," but the "Old Nicol;" and, with this alteration, one may quote this description of it.—"A square of 250yds. or less—that was all there was of the 'Old Nicol.' But in that square the human population swarmed in thousands. Old Nicol Street, New Nicol Street, Half Nicol Street, lay parallel east and west; Nicol Row at one end and Edge Lane at the other lay parallel also; foul ways all. What was too vile for Kate Street, Seven Dials, and Ratcliff Highway in its worst day, what was too useless, incapable, and corrupt—all that teemed in the 'Old Nicol.'" We do not know by whom the first steps for sweeping away this refuse-heap were taken; it remained there for generations, ignored by many who passed it by, and apparently irremovable; a disgrace which is one of the penalties of

LONDON'S OVERGROWN BULK.

But at any rate it has gone at last; nothing remains of it but the names of one or two of the streets on the walls of houses condemned, but not pulled down. Half Nicol Street still flaunted its squalid disrepute in this manner

FIG. 34.

on a ruined wall a few months ago. The "Old Nicol" has been swallowed up in the new "Boundary Street Estate" of the London County Council—an estate of tall houses and wide streets with a general aspect such as a stranger led there blindfolded might imagine that he was in Kensington. The "Estate" has been growing for fifteen years, and the Council is now the landlord of 503 tenements and workshops. As fast as the buildings are finished they are let off to tenants, for whatever is scarce in this neighbourhood it is certainly not people. The blocks when completed will number seventeen, and will then house, roughly, 3000 people. So far the scheme has housed 2500. Whether it has housed the people whom it dispossessed is a different matter. The area which has been rebuilt covers about fifteen acres, and from its centre the different blocks radiate, much as do spokes from a wheel. Perhaps nothing strikes one so much at a first glance as the

DIVERSITY OF THE BUILDINGS.

No two appear to be the same. As a matter of fact, they have been put up by three different builders and by the Works Committee. But even the plans were intended to aim at diversity, and it is not too much to say it has been achieved. The second great feature is the width of the courtyards separating the blocks, the airiness secured thereby, and the very handsome ornamental space in the centre known as the Mount, laid out with shrubs, trees, and flowers. Once it was thought the Council might put a bandstand in the centre and discourse sweet music to its loving tenants, but cold water was dashed on the proposal to such an extent that the Council has now decided to place a fountain where they yearned for a bandstand. The buildings are

SPLIT UP INTO LODGINGS

of all sorts and sizes, from a single room at 3s. 6d. a week to a four or five roomed flat at 13s. 6d. The "flats" are self-contained; the "single rooms" oblige their lodgers to share sinks and so forth with fellow tenants. Here, of course, one comes straight against the second of the two difficulties which have to be faced in any scheme for housing the poor. The first of the difficulties is the rent. The people who have paid 2s. 6d. a week for rent resent bitterly the extra 1s., and what they resent more is the absolute necessity of having to pay it promptly instead of owing it. In the second place, the people who have lived in 2s. 6d. rooms—perhaps with lodgers—cannot bear to be clean, and cannot be made so. There are decent and cleanly tenants in the "flats;" in fact, four clergymen tenants are to be found among the blocks, and some of the windows in the Boundary Street estate are decked with "art" curtains and flower boxes. But others are already embellished with what look

FIG. 35.

like old petticoats instead of blinds. It is the same with the courtyards and the staircases. Most of the courtyards are clean, but several are absolutely dirty; refuse has evidently been thrown down from upper windows. The very narrow space in which families are housed—a family of six in a small living room and two tiny bedrooms, though far removed from comparison with the pestiferous conditions of the "Old Nicol," is still not a pleasant thing to contemplate—has caused heaps of rubbish to overflow into balconies that were originally intended, doubtless, to be ornamental. Generally speaking, a living room and two small bedrooms cost 8s. 6d. a week, to be paid in advance; usually these little flats are self-contained. They are not really cheap; the full value of rents in the neighbourhood is charged. The Estate has also seventy-five workshops, varying from 3s. 6d. to 6s. 6d. They let readily, a fact which, though going to show that there is a real demand on the part of workmen and artisans for the accommodation which the County Council has provided, yet also proves that the dwellings do not house the tenants of the site. On account of the impossibility of getting water up to the top of the buildings, the Council has built a

LARGE CENTRAL LAUNDRY, with forty-two troughs, all numbered, with drying horses, hot and cold water, &c. The trough is partitioned, and in the back part the clothes are boiled by steam coming through a perforated pipe. There is a separate mangling and ironing room; the mangles are driven by steam, the irons heated by gas. The convenience of a laundry can be enjoyed for 1½d. an hour; but those who know the ways of tenants will not be surprised to hear that the sum is begrudged. There is also a club and reading-room for the use of the tenants; 6d. a month is the subscription for a man and his wife, 6d. for a single man, 4d. for a single woman. To sum up, one may say that the Council has not in the Boundary Street Estate solved the problem of providing for the disinherited slum dwellers; but it has done something to help those poor who are not wholly incapable of helping themselves.

It is suggested that a system of electric lighting will be instituted in Blairgowrie. A syndicate is now formed with a capital of between £8000 and £10,000. A HUGE steel gas tank belonging to the Consolidated Company, in Avenue A, New York, collapsed last week. The tank, which contained 8,000,000 gallons, was being subjected to the water test. The water in the tank poured in a huge wave, 10ft. high, over the surrounding district and caused great destruction. Six bodies had been found in the wreckage up to last evening, and one person was still missing. Twenty persons altogether were injured.

Trade and Craft.

STEAM ROLLER FOR SPALDING.

At a meeting of the Spalding Urban District Council, it was decided to purchase a steam roller at a cost of £360. The roller is to be one of ten tons, to be supplied by Messrs. Aveling and Porter, of Rochester.

ELECTRICAL MACHINERY AT DRURY LANE THEATRE.

The first section of the electrical stage appliances at the Theatre Royal, Drury Lane, designed by Mr. Edwin O. Sachs, has been completed. The area of the stage, moveable by mechanical power, now exceeds 1100 square feet. Mr. Sachs' installation primarily comprises a series of large "bridges," with the aid of which the finest terraces can be formed in a few seconds, or the deepest caves arranged for underneath the stage by simply pressing a button. Whole scenes can be rapidly raised or lowered, and transformations made with the greatest ease. The introduction of modern mechanism on these lines will open an entirely new era in the mounting of plays.

COPYING DESIGNS.

A statement comes from Berne which, if confirmed, will be likely to affect seriously the sending of goods to the Paris Exhibition. An embroidery manufacturer at St. Gall noticed that a design registered by him in Paris had been copied by a French manufacturer at St. Quentin. He brought an action against him, and the Paris Court of Appeal decided against him, basing its decision on a French law of 1806 and an Ordinance of 1825. The verdict has the following consequences: the designs and patterns of foreign manufacturers who send goods to the Paris Exhibition of 1900 may be copied with impunity by French manufacturers if the exhibitors do not possess a manufactory in France itself.

THE PHILOSOPHY OF HEALTH.

A new hospital at Newton Abbot was opened some days ago. The Right Honourable Charles Seale-Hayne, M.P., referring to the ventilation, which is on the Boyle natural system, said:—"I am a firm believer in what may be termed the Philosophy of Health. I believe also that it would be an excellent thing if in our primary schools greater attention was paid to instruction in hygiene. God has endowed us and blessed us with bodies that are wonderful machines, therefore it is our duty to take care that these machines are kept in proper working order. This hospital seems to be admirably designed and well constructed, reflecting credit on both architect and builder. In presence of the crowded and distinguished company which I have the honour of addressing, I need not

say, because the temperature attests it, that the ventilation of this hospital is upon the best and most scientific principles. I said just now how important was the subject of hygiene, and in no respects is it more valuable or necessary than in the subject of securing for our public buildings the necessary amount of fresh air. But if a pure atmosphere be necessary for us who are in health by the blessing of Providence, how much more necessary is it that our afflicted fellow creatures, stricken down by accident or disease, and denied for the time the blessings of outdoor exercise, should have secured to them the healthiest possible surroundings. I am glad, therefore, as I say, that in this new hospital the Committee of Management, or the architect acting in its behalf, has selected and adopted what I believe to be absolutely the best system of airing a public building that is known to sanitary science."

STRUCK OFF THE LIST.

The secretary of the Three Towns Trade and Labour Council informs us that at the fortnightly meeting great satisfaction was expressed on receipt of a letter from the town clerk of Plymouth announcing the close of a long controversy between the Works Committee of the Town Council and the Trades Council as to whether or not Messrs. Ellacott and Son, contractors for town work, were paying the standard rate of wages in the district. The Trades Council had contended they were not, in support of which evidence was submitted by letter and deputation to the Works Committee. Messrs. Ellacott met this with a denial. To prove the truth of their assertions the Trades Council requested that Messrs. Ellacott should submit their wage-sheet for inspection by the Works Committee. This they refused to do, and in consequence the Works Committee has decided that the firm be struck off the list of contractors for town work.

ALEX. BOYD AND SON'S NEW FIREPLACE CATALOGUE.

In the ordinary sense of the term this can hardly be called a catalogue, as, from the excellent information it contains upon warming and ventilation, one is disposed to regard it as a book of reference. The trade section, however, is carefully compiled, and all the stoves manufactured by the firm are well illustrated and described. Here one finds a section of a room warmed by an "improved descending warm-air stove," and here another showing the working of Boyd's automatic ventilating stove. In every case the important subject of ventilation has been carefully considered, and we have no hesitation in recommending those who appreciate the comforts of existence to use stoves manufactured by Messrs. Boyd.

LIFE POLICIES,
Shares and Debentures,
Mortgage Debts and Bonds, and
Kindred Interests,

on the FIRST and THIRD THURSDAYS in each month throughout the year, at the MART, Tokenhouse-yard, E.C. Remaining date for 1898:—
December 15th.

The following are the appointments fixed for 1899:—

January 5th	May 4th	September 7th
January 19th	May 18th	September 21st
February 2nd	June 1st	October 5th
February 16th	June 15th	October 19th
March 2nd	July 6th	November 2nd
March 16th	July 20th	November 16th
April 6th	August 3rd	December 7th
April 20th	August 17th	December 21st

Offices, 6, Poultry, London, E.C. Telephone No. 999 Bank.

FAIRMILE PARK, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

MESSRS. DRIVER and CO. have received instructions to offer to AUCTION at the MART, Tokenhouse-yard, Lothbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of **CHARLES JUPP, Esq., Solicitor**, 48, Lime-street, E.C.; and of **MESSRS. DRIVER and Co.**, 23, Pall Mall, S.W.

SURREY.—Choice BUILDING ESTATE.

—In a charming district, two miles from Horley station (L.B. and S.C. Rly.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church.

FOR SALE, a compact and valuable FREEHOLD PROPERTY of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Prettily timbered. Gas and water mains along the frontage. Would be divided.

Plans and full particulars of the owner's agents, **MESSRS. GREEN and SIMES**, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W.; or **MR. W. M. LEACH**, Auctioneer and Estate Agent, Crawley, Sussex.

MIDLANDS.—For immediate DISPOSAL,

in a very prosperous and growing town, a First-class BUILDER'S BUSINESS, with good town and country connection. Stock and plant estimated at £2000, all good stock. Fifty hands regularly employed. Books open for inspection and satisfactory reasons for disposal.—For further particulars apply **J. H. HEWES**, Valuer, Loughborough.

R.I.B.A. EXAMS. PREPARATION,

personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to **MR. W. CHURCH HOWGATE, A.R.I.B.A.**, Perchard House, 70, Gower-street, W.C. (close to the British Museum).

SANITARY INSPECTORS' EXAMINATIONS.

—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R.I.B.A., SOCIETY of ARCHITECTS, and

CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—**MIDDLETON and CARDEN**, 19, Craven-street, Strand, W.C.

PLANS, SPECIFICATIONS, QUANTI-

TIES, &c., carefully prepared by young Architect. Moderate terms to those about to build.—**ARTISTIC**, 1, West-terrace, Whitby.

TO ART STUDENTS.—A TRAVELLING

STUDENTSHIP of £50 is OFFERED by the **PAINTERS' COMPANY** for the encouragement of the study of Decoration. The Studentship is open to competition by students between the ages of 20 and 35 in any recognised School of Art or other Institution devoted to the study of applied Art in any form, and situate within the limit of the larger metropolitan postal area.—For particulars apply to the "Clerks," Painters' Hall, 9, Little Trinity-lane, E.C.

ASSOCIATION of DESIGNERS.

DESIGNS, WORKING DRAWINGS, PERSPECTIVES, ARCHITECTS, DECORATORS, & BUILDERS ASSISTED.

An Architectural Causerie.

At a Seaside Painting Ground.

THE sea seems to edge its way up to the land, and the fishing village to lean and bend to the sea, as though it stretched out both arms to it round the sheltered bay which forms so safe a harbour. The town of St. Ives in Cornwall, with its fringe of houses straggling up the hillside, lives its real life down below where the wash of the waves sounds in the narrow streets, and the place is redolent of salt water in every alley and corner. From the lodging house terraces the roofs fall sleepily underneath, greenish grey and dove-colour, with the square sandstone tower of the church rising among trees in the midst, till they reach the level of the beach with its boats and jetties and litter of seafaring tackle. Down the narrow tortuous streets the carts still rush at a pace reminiscent of times when the fish from St. Ives had to be driven furiously to catch the mail train a dozen miles inland. Along Digey and in Salubrious Place are plenteous signs that the pilchards have at length put forth, and come into the bay. The small solid houses crowd together up and down steps in dim courts and alleys. On strings tied across the house-fronts wet oil-skins and trousers are hung out to dry. On the beach with its ring of houses you see a green promontory, which stretches protectingly between the town and the wilder sea without the natural harbour. At its foot are the last ruins of the Breton House, where the Bretons stayed when they came to trade with their Cornish brethren, whose speech was like their own. This hill, rising green from its base of brown rocks, is sacred to the fisher people, and cannot be touched by the builders. The upper parts of it belong to the men and their nets. On the rocks the women spread out their linen, weighting it down with stones. On an October morning, as the web nets are spread and lifted in the sun, they glisten like gigantic dewy cobwebs. Flat on the ground they have the appearance some way off of a curious brown growth, and near you walk upon them warily, but they trip you up. They cover every yard of grass. When they are dry, the fishermen gather them together, and walk away with them wound about their shoulders till the man within is almost hidden in a mountain of nets. On the further side of the "Island" from the town is a wider beach, where the waves roll in with unbroken force from the Atlantic. On Porthmeor all the simple, crowded life of the town is forgotten, and as you stand on its long sands, the fishermen and women, moving on the "island" on your right, are small, silent figures bending among the nets or the more homely washing. The great beach extends in a semi-circular curve, with jutting rocks sprayed with foam at either end. Nothing breaks its splendid sweep as in the more homely bay where the boats are swayed by waves which seem almost tamed and subservient. Here the great

breakers chant their own song; springs break in the sands, making fantastic water shapes which reflect the sky with a curious stillness. But the white-tipped, rushing waves seem to carry their own colour with them. You imagine the depths of ocean round this coast as clear, clean, and full of light—so limpid, so translucent are the blues and greens upon its surface. At St. Ives the sea is everything both to fishermen and artists. Old people still remember the first painter who came there. He was a Frenchman, they say, and he went about exclaiming that St. Ives was full of pictures. They let him paint, and took no notice, evidently regarding him as a harmless madman. The tradition of to-day is that his picture sold for thousands of pounds. Since then there have always been artists, accompanied by that still stranger creature, the "artis'oman." Studios stand in every coign of vantage, among the houses of the fisher-folk, or pushing boldly out over the edge of the waves, blank towards

only for effects of light and colour, we seem to look merely at studies—incomplete, uninformed with a full meaning. Photographers would give us nearly as much pleasure. But when, as in Mr. W. H. T. Titcombe's studio, the sands of Porthmeor become the playground for Nansiea and her maidens—brown figures rushing after the ball; or when in a pool, among the rocks, the little mermaids beckon to the fisher-boy, fancy and imagination bring reality in their train, and we feel the sea is the sea, we know, real and alive—a glorious playmate, a magnificent and awful foe. A. G. D.

The Last of an Old London Inn.

THE old White Horse Inn, Fetter Lane, after being doomed to destruction during the last three years, has now been demolished. In the coaching age this was one of the best known

A DEMOLISHED LONDON INN: THE WHITE HORSE, FETTER LANE.

the land, but with large windows observantly peering out to sea. The largest and most important look out over Porthmeor beach, within touch of the spring tides, at the wide arch of sky, and the swinging surge of Atlantic billows. An enterprising stationer has opened a gallery in which the works of local artists are on view. In the shop there is beaten copper work made by the fisher-boys at Newlyn, and upstairs paintings are hung by men of more than local fame—Messrs. W. H. T. Titcombe, R. Levick, T. Eillie, Dow, Ollsen, and Grier. If we are to gauge anything by the label "Sold," it is that the visitor to St. Ives shares in the *étrange peur de la beauté*, and, like the customer who wished for a view of the town in a beaten copper tray, has a hankering for mementoes. Subject is more to him than arrangement. Sight, thought and fancy are more or less at a discount, and the bald presentment of some incident of a fishing town pleases him most. Let this be as it may, the conventional *genre* painter has had his day, and those marine painters who copy effects of the sea, content in their inability to draw, must look to their laurels and mend their ways if they do not wish to be stranded. They can no longer afford to shut their doors to brains and imagination. The sea, like a capricious mistress, may even be said to reserve her best secrets from those who follow her too exclusively. It is after all only one stage, a single background, of human life. Painted

among the hostleries from which travellers fared forth along the old highways of England. To and from the capacious yard, which even now exists behind the old house, went the "Accommodation" to Oxford, starting to that University city at seven o'clock every morning; the York "Highdier," a crack light-post coach, every morning at nine o'clock; the "Princess Charlotte" to Brighton; the Lynn, Dover, Cambridge, Ipswich, Bath and Bristol, and other coaches of lesser importance, and too numerous to mention in detail. The stables of the old place were large enough to hold seventy horses, and as many as two hundred guests could be accommodated in the hotel. At the foot of the staircase, near the entrance, is the office, and everywhere are long passages and interminable suites of rooms. The conditions of the inn were, however, very different in its last years of existence, for it had degenerated into a common lodging-house. Here, when the day's work was done, the kerbstone merchant came to grill the cheap chop he had purchased, and the professional cadgers regarded this as one of their favourite haunts. Where, indeed, Lord Eldon stayed, with other aristocratic guests, in 1766, the lowest of the low came in these latter days. The name of the house was then changed from the White Horse Inn to "White Horse Chambers."

ON REFLECTION.

It is strange to find a man of such a well-established philosophic and literary reputation as Mr. Frederic Harrison laying himself out to talk the frank twaddle which he addressed to an audience at Toynbee Hall, in a lecture on the subject of "London." Mr. Harrison said he wished to speak of what he would describe as "Ideal London," by which he meant "London as it ought to be, as it should be, and as it must be." Our readers may possibly be able to distinguish between London as it "ought to be" and London as it "should be;" but, to be candid, our own massed intellectual resources have so far failed to do so. Mr. Harrison has got up his Ideal London regardless of expense. He demands at the outset the apparent destruction of some two million persons, for he tells us that the London to be will not exceed two million inhabitants. It is not clear whether he relies on the Artillery corps or the Anti-Vaccination Act to effect this reduction of the population. At the same time, while he reduces the population by one-half, his ideal London is to cover only one-third of its present area. Thus the population would be more congested than at present, but at the same time, in the London to be, open spaces will be increased "so as to insure health to the youth of the population (applause)." The Embankment will be extended through the City, and "the river run as clear as at Richmond (applause)." "Streams of clear mountain water will be carried into London by gigantic aqueducts (hear, hear)." Mr. Harrison mentions incidentally that his "Ideal London" will take time to achieve. That we think is its sole recommendation—it cannot happen yet. The great apostle of comitism does not seem to realise that before that time comes our needs and ideals will be greatly modified, and innumerable ingenious appliances will be in existence, which will satisfy those wants much more completely than his clumsy old contrivances of "improved motor-cars" and all the rest. At a time when Londoners are actively exercised to meet the needs of their growing City, such sillinesses are grotesquely out of place. Mr. Harrison's lecture has no practical suggestiveness, and is not justified as a contribution to the mirth of the nation, while as an essay in fancy it is unworthy of consideration.

Colston Hall Competition.

WE find the result of this competition published in the Western Daily Press. The directors of the Colston Hall Company offered three premiums of £100, £50, and £25 respectively, to the authors of the three best designs. A large number of architects in various parts of the country competed, and the report of the assessor, Mr. Florence, who had devoted several days to a consideration of the designs before arriving at his decision, was presented on the occasion of a late meeting of the directors. The first premium has been won by Messrs. Frederick H. Jones and Erskine S. Cummings, of Westminster; the second by Messrs. Lanchester, Stewart, and Rickards, London; and the third by Messrs. Lawrence and Harold Smith, of Bristol. The drawings have been on exhibition at the Grand Hotel, Broad Street, Bristol, during the first days of this week. We notice, however, with surprise, considering the eminence of the assessor as Vice-President of the Royal Institute of British Architects, that the terms of the conditions do not bind the directors to commission the author of the first or any award as architects for the rebuilding of the hall. This matter, we learn, has yet to be settled. When we bear in mind that it is the commission to carry out the work, not the premiums, that attracts architects into competition, and

remember that the custom of promoters in disregarding this fact is the chief cause for complaint in the conduct of the system of competitions, it is strange indeed to find the conditions of the Colston Hall Competition bearing the ratification and approval of the Institute itself.

The First Lady Architect.

THE R.I.B.A. is to be congratulated on having elected a woman into its august membership. In view of the encroachment of woman upon the professions generally, which is one of the most characteristic features of the last quarter of the present century, it was inevitable that the practice of Architecture would not long remain undistinguished by the attentions of the sex. We believe that this general widening of the scope of women workers is described as the "emancipation of woman." We would rather be inclined to call it the "enslavement of woman," and when the novelty and adventure of the enterprise has disappeared, and after the usage has become general and labour obligatory for woman as it is for men, we foresee another and a much juster movement for the "emancipation of woman," when she will claim to be restored to her natural rights and privileges. There is no doubt, however, that her demand is as sincere as it is reasonable, and that as such it should be respected; and it was no doubt in recognition of this that the Institute admitted the precedent of woman Associates with a majority of thirty-five—fifty-one members supporting the vote while only sixteen dissented. The lady pioneer in question is Miss Ethel Mary Charles. She is, we believe, the daughter of Dr. Charles, of Rome. She was, with her sister, some time a pupil with Mr. Ernest George. We believe that we may shortly see her sister distinguished in a similar way. We remember that these two ladies were the occasion of a special general meeting of the Architectural Association in December, 1893, when their names were proposed for membership. It is somewhat to the discredit of the Association that their nomination was violently opposed. It should be remembered, however, that the constitution and *raison d'être* of the Architectural Association is primarily social and educational, and practical difficulties were presented by the proposed innovation which would not arise in the case of the Institute.

Royal Academy Prizes.

ON Saturday, the 10th inst., Sir E. Poynter, P.R.A., distributed the prizes to the Students of the Royal Academy Schools, at Burlington House, before a large attendance, despite the fact that this year is an "off" year. As is generally known, the gold medals and £200 prizes are awarded only once in each term of the upper school: i.e., once in every two years. The President particularly applauded the paintings tendered in competition for his Creswick prize, and commended the attention which had been given in the schools to drawings from the antique. The complete list of prize winners will be found on another page. With reference to the prizes awarded in the Architectural School the competition has been very poor. This would seem to speak badly indeed for the usefulness of the school. Apart from the two prizes which are given for the best sets of drawings done respectively in the upper and lower schools during the year, there are five prizes for special subjects offered. Of these five only two have been competed for. Thus the prize for architectural design—"A Town Church," has been won by William Hawke; that for planning by A. C. Martin; but the measured drawing prize in which two prizes are offered, the prize for composition in ornament, and the

prize for perspective drawing, were none of them competed for. We believe that, although the school is not very well attended, and the rules of admission and the age limits have been shifted and changed a good deal in the last few years, the prizes generally produce a fair competition.

Perverved Enthusiasm.

LONDONERS have a right to know how the money they pay for the maintenance of the public property is expended, and we are glad to be able to post them in one item at least of this expenditure, viz., that is to say, varnish and good Stockholm tar. And what is the use of varnish and good Stockholm tar? Why to paint bronze statues withal! This is in accordance with exact particulars sent us by a correspondent who, referring to a paragraph in this column of two weeks back anent the proposal for statues of Milton and Chaucer in London, calls our attention to the treatment which has been accorded to the bronze statues in the Embankment Gardens. "They have," he says, "been covered with some stuff that looks like varnish or Stockholm tar," and this he adds, has been daubed on over dust and dirt. Thus does Britain distinguish her great. Our correspondent does not seem to have any idea what the object of this process may be, and we are ourselves entirely ignorant. If it was the summer the process might commend itself as tending to reduce the great surplus fly population of the metropolis—but it is winter. The only explanation which presents itself is that there was an official residue of the above material left on hand, and, an official residue being nearly as discreditable as an official deficit, it has been sought to utilise the substance to its best advantage. No one can say it is not conspicuous and distinguished where it now reposes. Our correspondent lays the blame of this outrage on the L.C.C. We do not think the Council deserve that this imputation should be thrust upon it unsubstantiated; but it is certain someone ought to be spoken to by someone else pretty sharply.

Mr. Whistler and the Critics.

THE little band of architects who were responsible for that most interesting picture exhibition of recent years, "The Exhibition of International Art at Knightsbridge," have just issued a valuable record in the shape of an illustrated catalogue published by Mr. Heineman. The illustrations have been wisely selected to give a good general idea of the nature and scope of the exhibition, and have been most admirably reproduced by Messrs. Carl Hentschell in half-tone photogravure. The President, Mr. Whistler, in his inimitable fashion, flays again the foolish critic who ventures to obtrude his folly, and display his ignorance alike of painting, of Art, and of criticism, in fatuous comment:—

182. Blue and coral—"The Little Blue Bonnet." An oval.

... "old works... among which 'The Little Blue Bonnet' is the least known."—Times.

"As the painting has never been out of the studio but comes fresh from the easel to its first exhibition, the 'plain man' is, once more, profoundly right, and we see again the advantage of memory over mere artistic instinct in the critic."—J. McN. W.

Nothing could be more finished, more inevitable, than this display of his adversary's nakedness. The delicious perfection of it roused a new enthusiasm for the artist's mordant wit, and stimulates the interest with which all await his promised reprint of the "Gentle Art." Messrs. Heineman and Messrs. Hentschell are alike to be congratulated on an interesting record of a notable exhibition.

RELICS OF OLD LEEDS.*

BY PERCY ROBINSON.

THE publication of such books as this can scarcely be a source of profit to the author, the demand for them being small, even when they are well done, as is the case in the present instance. A list of subscribers is appended, from which one learns that only 108 copies of the book were subscribed for; and this number includes five copies given to public libraries, and several which went to people outside of Leeds; one, indeed, having travelled as far as Bulawayo. Away from England the history and antiquities of one's native place become most interesting, but as long as one lives at home one does not care to much encourage those who labour to record the little that is still left us of the work of our forefathers, if one may judge from the example of the good folk of Leeds. It is true that there are not many relics of antiquity left in that busy town, and that some of those here recorded have since been swept away, but Mr. Robinson's book contains not only drawings which preserve for us the outward appearance of buildings which have already perished or are about to do so, but many most interesting details about the life of past generations, and curious bits of information concerning discoveries which have been made at different times within the township and its neighbourhood. Take, for instance, the prices of articles of food in the reign of Edward III., given on page 11; and the curious details concerning the vicar's tithes on page 40, which make one quite understand how anxious everyone concerned must have been to have them commuted, as they were in 1823.

The book commences, as is usual, with a short historical sketch, which shows, among other things, that in the seventh century there was a town on the same site inhabited by Christians.

amounted to £10,000 per annum, indicating great prosperity in the staple trade. A new charter was petitioned for and granted in 1661, on account of abuses which had arisen, and this has remained in force until the present

but recovered many years after by Dr. Gott, the then vicar, from a grocer at Rottingdean (!) who had bought it with other property of his. A few old houses are scattered about the environs, but most of them possess little architectural interest, and the literary part of Mr. Robinson's book is quite as interesting as the pictorial. The smaller drawings are generally more successful than those on a larger scale, the difference of manipulation requisite for those intended to be slightly reduced and those which are to be made much smaller not having been accurately gauged. Mr. Robinson and those who like him are bestirring themselves to record the fast vanishing remnants of the life and surroundings of bygone days are doing a very real service to the community. Our illustrations are republished from the book, by kind permission of Mr. Robinson. S. S. G.

ONE OF THE OLDEST OF LEEDS HOSTELRIES.

day, except for five years during the reign of James II.

The most interesting building now remaining in Leeds is the Church of St. John, built as a chapel-of-ease in the reign of Charles I. by a Mr. John Harrison, there being very few churches of this date and character in England. It was commenced in 1631 and finished three years later, and the day of consecration was marked by a most curious incident, viz., the suspension of the newly appointed

incumbent; his sermon, preached in the afternoon, having been considered to reflect upon that preached in the morning by the Archbishop's chaplain, Dr. Cosen. The plan is very unusual in England, consisting of a nave and aisle of the same size, reminding one of the planning of the Jacobean churches, though the chancel in this case is attached to the nave solely. The roof is pargetted in panels with ornament, there is a very fine carved screen, and the pews are also ornamented with carved panels and terminals. It is scarcely credible, but is, we believe, the case, that before the restoration by Mr. Norman Shaw, in 1867, it was proposed to pull this most interesting church down and build up a nice new one in place of it, and it was only owing to the determined opposition of one public-spirited gentleman, and after a long fight, that the other course was adopted. The parish church, a perpendicular structure in the main, was pulled down and rebuilt in 1838-1841, and several curious things came to light during the demolition. Fragments of earlier sculpture might be expected

to be found in considerable numbers, but a quantity of old stained glass which had been used as packing to courses of the stone work indicated a carelessness and disregard of the work of bygone ages which it would be hard to match even in modern times. A Runic cross of the tenth century was claimed by the architect,

A NEW KENTISH CHURCH.

ST. ANDREW'S CHURCH, Orpington, was commenced in 1892, and is a Mission or Chapel-of-Ease to the interesting old parish church of All Saints, Orpington. At present the chancel, morning chapel, vestry, organ chamber, heating vault, and two bays of the nave only are built, leaving for a future extension the remaining three bays, the north porch, and the tower and spire. The church was designed to accommodate 630, and to cost £5000 without the tower, spire, or porch. Of necessity, therefore, the detail is of the severest description, and stone is very sparingly used. The internal and external facings are washed stocks. Box Ground Bath stone is used for the external dressings and Corsham Down inside. The roofs are of Memel fir and yellow deal boarding slightly stained but not varnished; they are covered with hand-made tiles of good colour from tile yards at Wrotham. The joint architects are Messrs. E. Hide and J. E. Newberry. Our illustration of the east end (page 333) is from a photograph by Mr. A. P.

COTTAGES, ST. JOHN'S COURT, LEEDS.

St. John's Church

THE OLDEST CHURCH IN LEEDS.

Monger. The lofty opening in the north wall of the chancel is intended to receive an organ case—the arches in the south wall open into the chapel. The dossal, altar-rails, and stalls are temporary. The caps to the pillars and piers are left in block at present, but will be ultimately carved in a simple free treatment.

In 1207 the lord of the manor granted a charter to the burgesses, but the first charter whereby the town and parish were constituted a municipal borough, dates from 1626. Shortly after this time the duty paid on cloths exported

* Leeds, Percy Robinson. London, B. T. Batsford.

PRACTICAL APPLICATIONS OF ELECTRICAL POWER.*

By H. R. J. BURSTALL, M.Inst.C.E.

IN defining the scope of his paper the author said he proposed to deal with the general principles underlying the application of electrical power, to describe a few typical forms of apparatus, and to discuss the question of the cost of power under ordinary circumstances. Electrical power, as distinct from lighting, in buildings for non-manufacturing purposes, may be generally applied to, roughly, five classes of use: lifting and hoisting; ventilating; driving machinery for small trades and for domestic purposes; pumping; heating and cooking. In all except the last class, electrical power is applied by means of electric motors, the type varying according to the purpose for which the motor is required. Most motors are supplied from a continuous current system, the electrical pressure varying

Slow speed motors are largely on the increase, the extra first cost being compensated for by the reduced wear and tear, and by the advantage gained through direct coupling the motors to the machines.

THE SPECIAL MACHINERY AND APPARATUS REQUIRED

in the application of electrical power to each of the five uses above mentioned were next discussed and described. In lifts, although the broad principle of electrically driving them is quite a simple one, the actual machinery has to be most carefully designed and arranged, special motors and switches and gear being employed to ensure efficiency and economy. In ventilation electric motors form the best driving power for operating fans, whether large fans for the ventilation of a building on some complete system, or small fans for extracting the air from particular rooms, or even for stirring up the air in any room in the manner of a punkah. Special care is required to avoid the noise of the machinery, and fan and motor should, wherever possible, be carried not from the sides of the air trunk,

an ordinary fire or gas stove. The lamps are arranged in special reflectors so as to obtain a "beam" of heat rays. The apparatus is simple, easily fitted and understood, and free from risk of breakdown. The heat obtained being radiant heat, does not produce the enervating feeling produced more or less by all methods of heating by warming the air, and the effect produced is similar to that from an incandescent gas stove or bright red coal fire. The author then discussed the question of cost. Electrical energy is charged for at the rate of so much per Board of Trade unit, a unit being an amount of electricity which will keep an eight candle-power lamp alight for about thirty-five hours. This amount of energy is equivalent to 1.34 horse-power exerted for one hour. The Corporation of Edinburgh charge 1½d. a unit for power. In London the average charge is from 3d. to 4d. Private installation on a reasonably large scale, and economically worked, would cost at from 2d. to 3d. per unit. A passenger lift for carrying nine persons, running at a speed of 175ft. per minute, will require about 0.06 units per journey, taking the average of the day's

WREXHAM COUNTY SCHOOLS. COMPETITIVE DESIGN BY PHILIP A. ROBSON, A.R.I.B.A.

from 100 to nearly 500 volts, 200 to 250 volts being the most usual. Describing

THE GENERAL TYPE OF MOTOR

and its method of working, the author showed that the regulation of speed and power in it is carried out entirely by electrical methods, no sort of governor, as in a steam or gas engine, being as a rule required. Motors used for the purposes under consideration are usually supplied at a constant electrical pressure, and generally made in three types. Where constant speed is required, a shunt-wound motor is used. Where a large turning effort is required and not a constant speed, a series motor is used. A compound type is employed in certain cases. It is sufficient to know not only the power required for a particular purpose, but also the conditions of running, before selecting the type of motor desired, and this selection can only be made from previous knowledge of the work or by experiment under working conditions. The author explained how the motors were regulated to avoid waste of energy. The speeds of electric motors, as usually supplied, range from 1000 to 1500 revolutions per minute for sizes from one to five horse-power; but motors running at from 200 to 500 revolutions per minute can now be had at reasonable prices.

but quite separately from a substantial wall. Noise is often caused by the pulsations of the air set up by the improperly shaped blades of the fan; in this case little can be done except to alter the fan. The loss during transformations of energy from the boiler furnace at the generating station to the coils in the heating apparatus is so considerable that heating by electricity cannot compete with direct heating by means of gas or coal for any purpose where a large quantity of heat is required. As, however, ordinary heating operations in a house are carried on under conditions in which the heat utilised is but a small proportion of that generated, it is possible, by properly applying the electric energy, to use such a large proportion of the energy as heat that competition with coal and gas is rendered possible when other considerations as to dirt, &c., are taken into account. Generally speaking, heating by electricity is applied by passing a current through coils of wire of high resistance; the wires are embedded in an insulating covering, and are heated, together with their covering, to the temperature required. Another method, in the author's opinion of great value, is

TO PASS THE CURRENT THROUGH A NUMBER OF GLOW LAMPS,

the lamps being proportioned so that their filaments are not completely incandesced, the room then being heated by radiation as with

work. This, at 4d. per unit, will work out at about ½d. per journey.

IN VENTILATING,

generally and very approximately speaking, one horse-power is required to deal with 20,000 cubic feet per minute, which would correspond to about ¾ of a unit per hour, and, at 4d. per unit, would cost 3d. per hour. Small machinery may be driven by electrical power for fifty-four hours per week at a cost of £48 6s. per actual horse-power per annum. An electrical pump, one horse-power, will require the expenditure of about 1½ units per hour. For heating, an ordinary electrical radiator suitable for a small room costs, at 4d. per unit, from 4d. to 8d. per hour. The Dowsing glow lamp radiators require about ½ unit per lamp, and a radiator of four lamps, sufficient for a small room, would cost 4d. per hour at the 4d. rate. An appendix to the paper gave a number of figures in tabular form as to the cost of cooking apparatus. In installing electrical machinery the regulations of the various fire offices as to the use of electric motors should be borne in mind so as to avoid any trouble after the apparatus is installed.

A new building, to be used as a working men's institute, in connection with the Speedwell Church Mission at Staveley, has been opened by Mr. T. D. Bolton, M.P.

* A paper read before the Royal Institute of British Architects, Dec. 19th, 1898.

PROPOSED HOUSE NEAR NORTHAMPTON. G. L. MORRIS, ARCHITECT.

The Position of Architecture among the Fine Arts.*

BY EDWIN T. HALL.

(Continued from page 312.)

MR. GILBERT, R.A., recently at the R.I.B.A., spoke of Wren's cathedral as the work of a sculptor-architect, by which I think we understood him to mean one who in designing in Architecture had the aptitude of the sculptor in proportioning his parts, and modelling the whole building as it were out of a lump of clay, producing a result graceful and so to speak well poised from all points of view. In speaking of this modelling of a building, it seems not inappropriate to say a word as to

THE PICTURESQUE IN DESIGNING.

Some few years ago we heard a great deal of this, and it was by some advocated as an end to be attained. The picturesque in our Royal Courts of Justice is noticeable, but I doubt if it was sought for at all by its author. It was more likely to have arisen out of the natural expression of the constructive planning, and it certainly may be asserted that in most of our old domestic work it will be found to have had its origin in the planning, in additions from time to time to suit varying wants, in the opening up of prospects, or in other natural ways. Unless it has such a natural basis it is incongruous. To distort an interior or exterior in order to get a picturesque effect is inadmissible. Symmetry in a design, especially of a public building, is an element of great Art value. Externally it contributes to the ideas of dignity and repose, and to that impressiveness due to simplicity. Internally a symmetrical plan is easy to follow, and the appreciation of the building is much enhanced if there is no irritation created in preoccupied minds by difficulty in finding one's way about. Mr. Aston Webb, at the Architectural Association, recently spoke ably on this subject. But symmetry does not mean cast-iron uniformity, or that everything is designed and set out with

GEOMETRICAL PRECISION.

The contrary is the case. The general effect is "ordered," so to speak; but Ruskin notes the variations in the width of piers and arches in the façades of numerous buildings which to the casual, inartistic observer appear rigidly symmetrical. I will cite but the example of the Car d'Oro Palace at Venice, where there is a battlement or cresting of varying height along the front. In the happiest way the architect has given the effect of symmetry, but on analysis it will be found that the effect is produced by an unsym-

metrical outline. This is but one of the æsthetic refinements of Architecture, where the idea is expressed without demonstration. In like manner, as I have endeavoured to show in the earlier part of this paper, proportion is not the result of following ingenious scales of modules framed on classic examples, nor of triangles based on Gothic structures, but should be

THE ÆSTHETIC EXPRESSION

of the ability of the various parts of a structure to perform the duty imposed on them, the lower parts being necessarily more massive than the upper. It was probably a recognition of this which led Vitruvius to lay down a law that in superimposed orders, the Tuscan or Roman Doric should be at the bottom, the Ionic next, and the Corinthian above that, because the first was the most massive, the last the lightest. But this arrangement gives us a cornice to the lowest storey larger and heavier than to the highest, whereas the function of a cornice to a roofed building is to throw the rain off the building, and to do this the cornice at the eaves should be larger, and with more projection than any other horizontal feature of the façade, and æsthetically this arrangement is, as a rule, by far the best. Proportion must, in any living architecture, vary with the material used and with the size of the building. The single order of the elevation of St. Peter's at Rome may be correct by scale, but it is unreasonable in its actual position. Again we do not quarrel with the proportion of an iron column or stanchion at the Crystal Palace. It is seen to be appropriate to the material.

THE EIFFEL TOWER

was formally protested against before its erection by a large number of eminent artists in France and elsewhere, but when erected, these same artists recanted their former condemnation, admitting its grace and proportion, these being evolved from the perfect expression of the functions of the materials employed. The fact is, we should concern ourselves less with the proportion of any detailed feature in a composition than with that of the broader groupings of the whole structure. Detail is interesting and important, and should be sedulously studied when we come to it, but it is not the be-all and end-all. That which is seen of any monumental architectural work is the mass. Mr. Walter Crane says that a people without Art are, collectively speaking, inarticulate. In other words, if I may venture to interpret him, they may be scientific; they may, like Faust, sound

THE DEPTHS OF KNOWLEDGE,

or, like Newton, soar to map the heavens; but unless they have minds to achieve and create, and the faculty to appreciate emotions and ideas, they are soulless—are of this earth, and not a part of the immortal. Mr. Crane adds

that the most vital art is the expression of character. If that be so, and if the noblest and most enduring quality of a race is character, then Architecture, among the arts, is the noblest and most enduring—that which expresses the virility of a nation. The formation of this quality of character is closely allied to religion. I cannot here enter into the philosophy of this alliance; but, accepting religion as a great agent, there can be no question that art is a potent influence in the teaching of religion. Science deals with demonstrable truth; Art, with imagination. Science tells us—very often on insufficient data, and, therefore, erroneously tells us—what is; and often

WILL NOT ADMIT 'ANYTHING'

to be which it cannot demonstrate. Art tells us that to live is the effort to be what life as defined by science is not; that if science makes anatomical sections of a man, maps his every nerve, and plans the channels of his life's stream, she has not found, and cannot find the man, the living soul which Art is ever disclosing in new forms. And as religion is the great exponent of the same message, she naturally draws to her this potent ally. From the earliest days it has been so, and hand in hand they have worked together. Architecture has raised the temple expressing the ideas which her co-workers expound. Among the arts there need be no rivalry. Architecture can mould itself in sympathy with the sculptor, and can adapt itself to

THE EXIGENCIES OF THE PAINTER.

The more massive art can accommodate herself to the less robust arts and make provision for their display to the best advantage. So let it be. What then are the practical conclusions to draw from our consideration of this most interesting subject. They are that the possibilities of our art are great, that the responsibilities of its exponents are greater. We have cause for much rejoicing that this wonderful century is closing with bright prospects for Architecture. It is more zealously and lovingly studied and expounded. Its spirit is more appreciated, not only by its ministers, but by a growing number of the public. This should rouse our enthusiasm, but, although enthusiasm is good, let it not carry us away to false ideals. Avoid the cant which suggests that it is beneath an artist architect's dignity to pursue the

HUMBLER DETAILS OF HIS STUDIES,

the scientific basis for his perfected work. Enthusiasm should spur us on to labour and to study. In itself it will attain nothing. Enthusiasm for music, and a nervous horror of discord, will not enable us to compose or to perform music, nor will a similar emotion make us architects. For us to carry the banner of our art still upward and onward needs a power to apprehend current needs,

* A paper read before the Architectural Association on Friday, Dec. 9th, 1898.

logical reasoning, much labour, courage, and technical study, as well as the environment of Art works, of liberal thoughts, high ideals and aspirations, and sympathy. We must throw off the shackles of past civilisations, not ignoring but assimilating all that they can teach us, and steadily seek to create and express what is best and brightest for our own time. In this way the position of Architecture among the arts will be a high and noble one, and with its sisters, sculpture and painting, it will beautify and ennoble the people's life, and so reverse the oft-repeated, but we would fain hope untrue, dictum that Art flourishes best in the decadence of a nation.—The paper was followed by a discussion as usual, in which Messrs. F. T. Baggallay, Thomas Blashill, B. F. Fletcher, C. H. Brodie, A. S. Flower, and G. H. Fellowes Prynne stated their appreciation and general agreement with Mr. E. T. Hall's statements. A vote of thanks was heartily carried.

OUR ILLUSTRATIONS.

A HOUSE AT NORTHAMPTON.

THE house of which an illustration is given is to be built $4\frac{1}{2}$ miles from Northampton. The plan, which is rather unusual, is to be slightly modified. The long hall, which is now 7ft. wide, is to be made 11ft., this additional width giving 4ft. more in the length of the drawing and dining rooms. The more domestic side of the house is practically distinct from the principal rooms, while being at the same time so arranged that the working

of the house shall be quite simple and convenient. The materials will probably be bricks of local manufacture (rough cast) for the principal part of the walling and Broseley tiles for the roof; the porch being built of a coral stone of a yellow tint alternately with bands of tiles laid flat. Inside the principal rooms will be laid with block flooring, and the woodwork generally painted, with plain papers on the walls. Small skirting and simple splayed plaster cornices in nearly all the rooms. The architect is Mr. G. Ll. Morris, 5, West Street, Finsbury Circus, E.C. The drawings were exhibited in this year's Academy Exhibition.

WREXHAM COUNTY SCHOOLS.

WE publish Mr. Philip A. Robson's design for the above competition. The competition was rather an unusual one, in that (*vide block plan*) latrines, gymnasium, chemical laboratories, lecturing theatres, and residential accommodation are already provided in the existing building; therefore the new building was only required to provide the ordinary Higher Grade School accommodation not already existing. Mr. Robson's design comprises ample accommodation required in a compact plan, and simple, though effective, elevation. The chief feature on the ground plan is a large central hall, 35ft. by 49ft., which is well lit by means of three large windows at one end, a top light running the whole length of the hall, and also borrowed light through the glass partitions all around the hall. The corridors are formed by three movable glass partitions, so arranged that when the hall is not in use for ordinary assembling purposes it can, at will, be utilized for prize distributions, theatricals, &c.

Class rooms for 180 children, on either side of the large hall, are provided for the boys on

one side and girls on the other, each having their own entrance, latrines, and cloak rooms, entirely separate from the other. Masters' and mistresses' rooms, and book stores, complete this plan. On the first floor the same number of class rooms are provided, as well as libraries, stores, latrines, &c., and also masters' and mistresses' common rooms, which dominate the whole length of the galleries. On the mezzanine—boys' cloak rooms, &c., are separate from the girls' common rooms. Ample heating and fuel chambers and store rooms are provided in the basement.

The architecture adopted is the taste prevalent and eminently characteristic for school buildings—Modern Renaissance. The heating is by the low-pressure hot water system, supplementary to the open fireplaces, and the ventilation principally by Tobin ventilators, and the "Honeyman" system in the roof.

The lighting is intended to be incandescent (Welsbach) gas. The cost has been very carefully inquired into, and is estimated at £8350. The materials used would be Ruabon red brick facings with Brybeg stone dressings, and Westmoreland green slates.

A JUBILEE CLOCK TOWER.

A clock tower has been erected at Skegness in commemoration of the Diamond Jubilee. The tower has been erected by public subscription, from designs selected in competition, and prepared by Mr. Edmund Winter, architect, of Egremont, Liverpool. An illustration appears on page 334. The lower part of the tower is in Ancaster stone, and the octagonal shaft in red brick with ornamental stone bands, the dial chamber being in teak; the whole being 75ft. high. Messrs. H. W. Parker and Son, of Boston, were the contractors.

FIRST FLOOR.

GARDEN

GROUND PLAN.

ON WALLING.

IT is almost superfluous to observe that variety in walling has gradually come to signify little more than just the difference which exists between the laying of stone and of brick. That this should be so is not, perhaps, surprising, for the natural tendency now-a-days with builders, workmen, and architects is to reduce the many ways of doing things to one that shall be at once expeditious and all-embracing. The number of methods, for instance, by which a wall can be built to fulfil its purpose and yet be beautiful is either never considered at all or ignored, on the ground of its being unusual. The careful choice of a stone, the varying in depth of the courses in some interesting way, the use of flint with brick, of stone with brick, and of stone, flint, and brick at one and the same time are all different ways by which certain pleasant effects can be realised.

In Wiltshire, that very flinty and chalky county, it is a common thing to find in the villages an admirable and practical use of flint and stone. In Steeple Langton, a small village about twelve or thirteen miles from Salisbury towards Warminster, the little post-office is built of stone, flint, and brick. Up to the ground-floor sills it is of coursed stone, not carefully laid, but good for its purpose. Above this, to the eaves, are flint panels alternating with stone, the latter occupying more space on the bed than the width of the flint panels. By such means, the ends of the stones slightly overlap one another, binding the flint well together. It is not always so carefully done as here, but the effect, even when carelessly carried out, is delightful. At the eaves line, where the thatch breaks up over the window heads (the heads being level with the eaves), the face of what forms a kind of dormer is filled in with brickwork. The first impression of this last wayward and irresponsible kind of treatment is that the cottager must have been short of flint and stone, and found it necessary to finish the building with a few odd bricks that were lying about in his neighbour's garden; and one would almost prefer to think that this was, so to speak, just the pleasant and natural way of getting over a difficulty. Some other cottages, on the further side of Salisbury, towards Lake House, are finished, however, in a somewhat similar way.

Between Farnham and Alresford, on the road to Winchester, are two or three examples of walling quite distinctive in their way. A cottage near Alton is a good illustration of this method. It has a base of red brick, with both angle quoins and dressings to door and windows of the same material, and the principal part of the walling of a greyish white stone, the courses becoming less in depth towards the eaves. In an examination of the cottage it was clear that the use of brick at all the angles was adopted for practical reasons, the stone being soft, and while satisfactory for the body of the building, would have been hardly suitable at the corners.

Another kind of walling is flint and brick, common in Hampshire, and occasionally a variation of it in Wiltshire. In this instance it is obviously a question of strength which determines the method of building, flint being seldom used alone for walling; brick or stone is introduced to bond it together. If brick, the wall is strengthened by horizontal bands, two or three courses to a band, every 2ft. 6in. in the height of the cottage or barn; the vertical uprights, still further apart, are toothed, that is, one course, say, 18in. across, the one below 14in. A barn somewhere between Alresford and Winchester is an example of this type of walling; at the crossing of the bands the bricks form a diamond shape, with small openings for ventilation. Each of these three ways are varied in the several districts, not from any artistic motive, but simply that what was good in one cottage was not, perhaps, good next door.

G. Ll. M.

ANCIENT ART AND ITS COST.

ALTHOUGH we often hear and see recorded the prices of modern art, we seldom or never see any reference made to the prices which ancient art fetched—in fact, it may be safely averred that there is probably not a single piece of ancient sculpture remaining, the original price of which has been preserved to the present day, while the majority of the famous pictures of antiquity have disappeared altogether. It would be of great interest and no little value to know what value was set upon the works of the great masters in their own day, and Pliny tells us with somewhat of old-fashioned indignation of the trifling of the luxurious age in which he lived and of the sums paid to artists, who did not then occupy the favoured position they do to-day. Plutarch also has something to say of the feeling which existed among the Greeks, as he remarks that “industry in servile or mechanic employment is proof of indifference to nobler matters. What young man of good birth and inquiring spirit would wish to be Phidias because he admires the Zeus at Pisa, or to be Polyclethus after seeing the Hera at Argos?” and so in the same strain, which shows the enormous gulf which divided nations, ancient and modern, upon the subject of artists. Below, however, will be found a few casual notes on the prices of works by some of the great artists of old. Thus it would appear that Zeuxis made so much money by his pictures that by middle life he refused to sell any more, and henceforward gave them away. For Alexander with the thunderbolt in the temple at Ephesus, Apelles received twenty gold talents, which may represent any sum between four thousand and sixty thousand pounds, though we know that he received £11,000 from Protogenes, at Rhodes. Panyshilus, by whose influence drawing was introduced into every school in Greece, levied a fee of £220 from all students who entered his studio. King Attalus secured a small work by Aristides for £130, and Agrippa paid 10,000 guineas for an Ajax and an Aphrodite, by an unknown artist, while Hortensius paid £14,000 for a picture of the Argonauts, by Cydias. Antidotus refused £13,500 offered by King Attalus for a scene from the Odyssey, and Julius Caesar bought an Ajax and a Medea from Timomachus for £17,000. For the statue of an effeminate youth Polyclethus received £22,000, and Porsis received £220 for the model of a Krater—a large bowl for mixing wine, and for a plaster statue of Felicity £2125. The Colossus of Rhodes cost £66,000, and the great Apollo in the Capitol £111,000. So much for the pictures and sculpture of those days. Pliny gives a few remarks on the then value of plate, saying that “in any time, by Hercules, a provincial knight on campaign, in the most barbarous regions, too, carried with him 12,000 pounds of silver”—a marvellous change indeed from the time when the Ælian clan had but one silver cup among them. Coming to the prices of ancient silver plate, we know that Crassus paid Mentor 800 guineas for two small cups, and for many others 40 guineas the pound. Two cups by Zopyrus fetched 100 guineas, a bowl by Pytheas realised 360 guineas, and a lamp stand 400 guineas, a slave also passing with this, evidently to attend to the lamp. These constitute a few of the prices paid in the brave days of old, and the list could be considerably extended. There is not so much difference after all between the ancients and the moderns in this respect.

At the Northampton Institute, on Friday evening, December 9th, was held a members' and students' conversazione, which was largely attended. The prizes and certificates were distributed by Mr. Charles Dorman in the large hall, and a feature was made of “Lectures” given by Dr. Walmsley, Mr. John Ashford, Mr. C. V. Drysdale, and Mr. Hugh Davies. We cannot altogether congratulate the Institute upon their exhibition, which, particularly in the architectural and building sections, was weak; possibly these branches are not so well patronised as they ought to be. The artistic crafts exhibits were certainly the best.

KEYSTONES.

THE removal of the furniture and fittings from the existing Town Hall at Colchester, shortly to be demolished, has commenced. The Town Clerk and his staff will occupy offices at No. 3, High Street.

THERE has just been placed in the new chapel of Cheltenham College a painting by Sir W. B. Richmond. It is on three mahogany panels, and forms part of the altar given by Mrs. Southwood in memory of the late Rev. T. A. Southwood, one of the former masters of the college.

A new organ has been erected at the Church of St. Bartholomew, Wickham Bishops, at a cost of about £300. Messrs. Beale and Thynne, of Shepherd's Bush, London, were the builders of the new organ, which is constructed on the tubular pneumatic system. It has two manuals, with thirteen stops.

EVERY year since 1892 has witnessed some new addition to the Borough Polytechnic Institute, and the number of students has increased in proportion to the facilities afforded them. The latest improvement has been the addition of new mechanical workshops, cookery school, physics, laboratories, and gymnasium.

THE Church of St. Augustine, Sheffield, erected in memory of Archdeacon Favell, of Sheffield, has just been opened. The church, which will at present accommodate 650 worshippers, has cost about £10,000. It is in the early English style, and is the third new church which has been added to the diocese within the last fortnight.

In order to perpetuate the memory of Puviss de Chavannes, and to show their appreciation of the magnificent gift of his drawings which he made to their museum, the inhabitants of Lyons have given the name of the great artist to the present Place des Hospices, Avenue de Noailles, of their town, where a statue will later on be erected to him.

THE Blackburn Corporation, which recently acquired the tramway system of the borough for £77,000, and substituted electric traction, has agreed to join the Darwen Corporation in buying the steam tramways connecting the two towns, and owned by the Blackburn and Over Darwen Tramways Company. The purchase-money is £48,500, Blackburn's contribution being £23,000.

A FINE example of the work of Mr. Charles Jones, R.C.A., has just been presented to the Walsall Art Gallery by Mr. Thomas Gameson of that town. The late Charles Jones ranked among the best English animal painters, and in the picture just given to Walsall, the subject of which is a ram pursued by a collie dog over a Scottish moorland, and which is entitled “A Hard Chase,” the artist's powers of delineating animal life are exhibited in their fullest vigour.

In our article on the work of Mr. Edward Goldie, which appeared a fortnight ago, it is stated that Ashorne Hill House is carried out in red brick, whereas it is built in a local stone from the Edge Hill quarries—an iron limestone varying in colour from warm brown to a blue grey. A second mistake has also crept into the article. Mr. Goldie has built extensively both at Hayward's Heath, Sussex, and Hawkesyard, Staffs., and the references to this latter work should be taken as treating of the former. This mistake is extended to a plan and perspective which are given as “Convent, Hayward's Heath,” and should be “Dominican Priory, Hawkesyard.”

MR. ALFRED GILBERT, R.A., has been elected to, and has accepted, honorary membership of the Society of Designers in the place of the late Sir Edward Burne-Jones. The other honorary members are the Princess Louise Marchioness of Lorne, and Sir E. J. Poynter, President of the Royal Academy. The election of honorary members can only be made by the unanimous vote of the Council. The Society of Designers has progressed in a remarkable manner since its formation in 1896, and now numbers upwards of a hundred members. The headquarters are at Clifford's Inn, Fleet Street. Membership is open to all professional designers, whatever their style of work.

DECORATIVE STONE WORK AS APPLIED TO ARCHITECTURE.*

BY WILLIAM VICKERS.

BY giving this title to my paper I desire to embrace something more than "Architectural Sculpture or Carving," as already given by me before the Architectural Association of Glasgow. My desire is to combine masonry with the more ornamental parts, by applying masonry and carving in the true spirit that the architect, who is the chief, and who has designed and worked out practically on paper that which he desires to see put into solid material. To bring this to a satisfactory issue it is necessary that there should be a clear understanding between architect and workman, and an implicit confidence should be established to attain this by the craftsman having a knowledge of the best way of working intricate parts and putting the same together so as to form a whole or composition.

There will be some inclined to say, "But this is all cut and dried at the commencement." To a certain extent I will admit it is, though there is a great deal of knowledge required even then to carry out work to architect's details. In the same way with carving, a workman might be a very elaborate cutter of stone, but it is necessary that he should be more than that. He should be able to design, and adapt his work in that spirit that the architect has conceived his work, so that when these connecting links are welded on to the building there will be one affinity of purpose, one harmonious effect upon the whole.

I will first of all try to explain what should constitute a practical craftsman in both of these branches—masonry and stone carving. You will all agree that a good general education is necessary, which is a proof, in the first place, that there is some intelligence and brain power to work upon. Taking the young man or youth who wishes to be a craftsman in masonry, what has he in view when he settles himself down to learn the trade of masonry? Is it a desire to become simply a hewer of stone or banker mason, with just sufficient knowledge in busy times, and, with the assistance of a shed foreman to apply his moulds for him, that he may obtain the current rate of wages?

If that is his ambition, then I will not hesitate to assert that his life is a wasted one. His thoughts and mind are not upon his work; the day, from morning until night, will run far too slowly by; the end of the week will be longed for by this supposed tradesman, and for what purpose—simply to doff his apron and do his level best, with the aid of Cup Ties and League fixtures, to forget all about his trade until Monday morning. Do not think, that I apply this to all youths who follow the craft; there are some exceptions, but, I am sorry to say, very, very few in comparison to the great number who are following this branch of work, and, if proof were needed, I will ask what proportion of these young men in the City of Glasgow are attending the technical schools, where drawing and practical geometry might be acquired, so that they might apply it almost daily to their work, and so lighten their burden and make work a pleasure.

One great evil lies in many youths being taken on who are not thoroughly bound down for a period of years that will make them, if they have the desire, craftsmen in the ordinary way, but they pick up a smattering of the trade here and there for two or three years, and, in a boom like the present time, go on to a job, demanding like an experienced workman full pay. That will answer very well for awhile, but after the boom! Oh, what a weeding-out takes place.

Some will ask: What would be expected from a boy? Would I make his life a misery, or try to kill him right out, and so on? By no means.

I would make his life as well as his work a pleasure. I do not suggest all work and no play. I would ask of him when he is at work to try and fathom what his work is for, and what place it takes upon the building. If it is moulded work that he is doing to take note of the section and try to draw it. To do this I advise him to attend some of the classes, of which so many exist in Glasgow, so that he may get the assistance from practical geometry to enable him to draw any figure or section.

Now, this latter part of my advice is really the hardest at first to many. It will appear to some, who have not long left school, like going back to some drudgery escaped from; but let these young people drive this out of their heads—it is only the start that is a little trying, wait until you begin to feel the use of drawing, and its application in your work, not only on the banker with everyday work, but in con-

—a man who has never bothered his brain to know anything, but trusts to his neighbour putting on every line. But does this knowledge terminate here? Surely not. Having attained this much, there is a stimulus and a desire to better himself, to put his knowledge to something better than the ordinary union regulation so much per hour man; he will aim at being a leader of men, either as a foreman or clerk of works, and this, I contend, is the right material to make such men of.

Now of the latter stage of experienced craftsmen I will also offer a few remarks or suggestions.

There is never too much acquired in knowledge in whatever branch of trade we may follow. Take masonry in relation to Classic Architecture. He should make himself acquainted with every specie of moulding. In some cases he is required to use a little judgment even to drawings that are supplied from architects' offices, but sometimes—owing to details not coming out of those sacred portals quick enough (and I think I have heard murmuring on this score sometimes) to satisfy the needs of some anxious and energetic master mason—a little knowledge of this would not only benefit his employers and himself, but would assist the architect, thereby causing greater confidence to be established between them. I could give several instances of this in my own experience; one case where a master mason on a large job was ready for a cap course, with a pile of masonry ready worked for building on the top of this, but by some oversight the detail of the cap was not prepared. I was asked to give a plan that would suit a special type of carving. This was submitted and approved, so the work proceeded. Now in this case the mason, a good practical man in many things, but either through nervousness or inability could not do this. Take, again, masonry in Gothic work in its infinite variety of forms and sections of members. How many of the average good masons can undertake this work without guidance? But go further, take that masonry that holds its own even with carving in its ramifications. See the intricate mouldings on canopies and pinnacles where the masonry and carvings vie with each other for superiority, shewing that the mason and carver must work together for a harmonious success.

This cannot be attained without study and reference either to existing old work or books, but preference is given to the former. Of this I will refer to again towards the close of my paper. When a man feels that he has succeeded in attaining this ability—a position that an architect is pleased to acknowledge—there is then formed a mutual understanding, a confidence not too often found to exist between architect and craftsman. Before leaving this subject I wish to refer to an abuse which really amounts to degradation of the mason's work, which I feel I must touch upon in this paper. It relates to the cutting of moulds for masons by other tradesmen, a practice I have observed in this country on more buildings than one. It is admitted by the master mason, and his foremen have simply to obey his instructions, and the masons themselves are practically indifferent to it. I do not desire to suggest anything that would for one moment cause any friction between employers and employes, but I would venture to state that the Mason's Union would do far worse things than settling this question of having their moulds cut by masons only. It is customary, I believe, in tendering for work, for a stipulation to be inserted in the schedule that this part of the work shall be done by the joiner. But really, if the mason is to rise to shift for himself, it is time this system was abolished. Perhaps this accounts for so many more clerks of works being selected from the joiners (and I have come across a joiner being the foreman over a large body of masons), all this owing to their acquaintance with drawings and mouldings being greater than masons. I will admit that they certainly are open to commendation for more enterprise and ambition, if nothing else.

I will now devote attention to the stone carver, and give you my version of what should constitute a stone carver, and how it is neces-

BY W. VICKERS.

struction. The hardship has vanished then, and, in its place there is a pleasure not known before, and by that little knowledge is nourished a desire and craving to know more.

My experience of a mason when he has a job given to him, say an intricate piece of work, is that if this man sees at a glance what is required, he grasps in a moment its situation and the way to proceed to work. That man, I say with truth, feels a pleasure in his work; there is an air of pride, yes, of dignity about him, which I am sure many others might envy. Oh, what feelings of contempt and pity he must have for the man perhaps working next to him, his banker-mate (and not always through choice), placed there by a shed foreman so that he may have near him someone to lead

* A paper read before the Glasgow and West of Scotland Technical College Architectural Craftsman's Society.

AT NEW COLLEGE, OXFORD.

sary to educate him. Equally so as the mason, he should have brains and education, but, differing somewhat from the mason's qualifications, he should be possessed of some artistic taste. I do not say this detrimentally to the mason, by no means. I know of some masons who have artistic taste, and who have left masonry to follow carving, making very good workmen also, but masons do not require to have that artistic taste for masonry that carvers require for carving. Well, admitting this artistic taste to exist, he should then undergo a thorough term of apprenticeship of five years at the least, a thing which, I regret to say, is very much neglected in this country, for some acquire what little knowledge they have in much the same way as the inferior masons, by picking up a bit here and there. During this period of apprenticeship, the best use of his time should be made, not only in stone carving, but in taking advantage of the admirable art schools that exist now in most cities, and, I must add, more especially in Glasgow. Firstly, he should become thoroughly efficient in drawing, not only freehand and model drawing, but he should acquire some knowledge of architectural drawings, or how is he to understand an architect's drawing, given to show where the carving is applied? secondly, equally efficient in modelling. From my own experience I contend that drawing from the cast must be acquired to make carving a success, and to enable the carver to read and understand an architect's drawing so as to apply a sketch if need be to suit his decorative work to the architectural intention. Modelling is required to put into relief, and in the round, and so work out parts that drawing would fail to convey. There are some people who deprecate so much modelling. Well, I must say that I do not entirely agree with them, for we are now living in an age in which architects are craving for and aiming at something new and original. The carver is compelled to follow on in the same course or fail. If it is work that a carver has often done before, some very particular architect will ask for a model. I have been asked many times, and have modelled just what I should have carved on the stone without models. Suppose you went to a noted *chef* and asked him to give some new dish, the ingredients would

require to be carefully adjusted, "modelled" if you like; but if you want a 4lb. loaf there is a great resemblance in all of them. In the same way if something is required new and original, both in the application of figure and ornament, a model is not only necessary for the carver and architect, but the safest and most successful way of executing work. In fact, I would go further, and suggest that a small scale—"say an inch and a half to the foot"—as a preliminary to the full size model for important work. I think this method comes so much nearer the scale usually employed by architects that it would be a valuable assistance to them in judging scale in the work that they were contemplating. Forgive this slight trespass in what I call the first stage in the stone carver's career, but this does not by any means complete him and make him eligible, only as a machine or copyist, or working at another's direction. He must be an earnest student of Nature, for in the same way as *lifestudies* are so necessary for working at the figure, equally so is natural foliage for ornamentation in decorative work. There are the five orders and the ornament that relates to each of them; owing to the stringent law handed down to us in regard to these it is not a matter so much of creating something new, but strictly adhering to each style. But if the different phases of Renaissance springing therefrom, it is more complicating, they being so numerous—French, Italian, Spanish, Flemish, German, and English, without taking into consideration the different architects' own views on the matter, sometimes two or more of these being jumbled up together, which creates a little bit of a puzzle for any carver. Other types of Renaissance are named after the architect for want of another name and lastly, I observe that they very widely differ as to what is the particular correct treatment.

Take, again, the Norman period, though that is not called into question so much, but it is all important to know something of it, as this was the forerunner of that style of which I wish to give the most importance in this paper, the periods of architecture and carving that made such an important era in English, and also in Scotch work, namely, Gothic. How much that name covers, from Norman up to the sixteenth century, and with such

changes and variations! How is it, I ask, when the question is put here to many carvers and masons, "What style is that building?" they answer "Oh, Gothic." "Well, yes; but what period of Gothic?" "Oh, well, Gothic." Why this evasiveness? They could not discriminate between one period and another, and yet it is so very necessary, if it is an early English building to apply early work to it, and if it is, say, perpendicular Gothic, to put that period of carving. It is not only the periods of Gothic that must be studied from old examples, but proportion and adaptation.

It is a very prevalent custom to have plenty of rough stone for the carver, and quite a common thing to see upon architects' drawings "Rough stone for Carver," and the always very observant master mason, with his eye to the main chance, how he hails this with delight—much easier for him to do this than work the mouldings. This is very good in its way sometimes—to have plenty of material—it gives architects a little longer time to think out what they require made of this rough stone—for, bear in mind, please, provision is made by leaving a lump of rock at certain places, but the object is not always conceived in the mind of the architect when the drawings leave his office, consequently there is an opening for a great amount of imaginative genius on the part of the carver. But do all carvers know when they have too much rough stone? I fear not. I have seen label blocks left 9in. or 10in. square and carved that size where 5in. or 6in. would have been ample for the label mould, finials double the size they should have been, and when carved out of all proportion with many other features I might mention to shew the necessity of study.

Then there is heraldry and Christian symbolism, which is so often required in decorative work. What a study in the first-named!—the divisions of the shield, the different tinctures, the crest, supporters, and mantling. Of course it may be said that there are plenty of works of reference which are sufficient guide for any ordinary craftsman, but that argument would apply to everything that a carver had to work, and even to Architecture also, though without a study of such things you cannot be expected to be educated in it.

Of the latter "Christian symbolisms" there

are the instruments of the Passion, Christian monograms, and the attributes of the saints. Lastly, I contend that a carver's study is never ended. Even with forty years' good practice on the best of work he may come face to face with a young architect with a smack of the impressionist school in his training who will quite bewilder the carver with his notions. What one architect may like another will not favour. Really one has to be in some cases a species of thought-reader, so that you may fathom what it is required, for, I am sorry to say, it cannot always be expressed what is the type of work required. In reference to the styles or periods and the decorative treatment of stone carving, as I have already stated, it is not necessary to speak of the five orders—the rules are binding on each of them—but the Renaissance work and its infinite varieties do call for a few remarks. In the first place, I would suggest that all carvings should be appropriate to the architectural surroundings. It should be the carver's endeavour to place his work where it is required with some meaning—some object. If it is to break the monotony of a large wall surface there should be good taste displayed, with sufficient in it to attract the eye, not altogether to the detriment of the Architecture; for, as I have remarked before, the carving must be subservient to the Architecture. And when it is meant to be a support or termination of mouldings, a frieze or panel, then the Architecture and the scale of mouldings must be well considered, so that the carving forms a part of the general scheme, and not as though the building were made for the carving.

What I observe upon many buildings in Glasgow is the mistake of trying to copy work which looks well in marble, where it originated, but looks very much out of place used upon sandstone. Unfortunately, it is not altogether the fault of the carver. Some architectural details in masonry err a little on this side. One could very well imagine some of it looking admirable in wood, and when the carving is executed in scale; it is too small, in fact, quite frittered away. If it is for inside work, and marble is the material employed, and low relief required, then by all means let your mind and heart be carried back to all the beautiful specimens of Italy, or, if of the French period, to the time of Francois I., where you may fairly revel in all that is small and beautiful.

There is some very excellent work upon some of the buildings in Glasgow, and one of the most successful is the Sun Insurance offices. There can be observed an application of ornament with some motive—some parts, such as the capitals, with the signs of the zodiac—other parts that indicate the purpose of the building, the whole being in good scale with the masonry, and forming a decorative feature. There is also some very commonplace work in the city and suburbs both in carving and masonry—carving with no meaning or feeling—and masonry where moulded work occurs a totally different section a few inches away from where the face-mould was applied will be found.

Regarding carving, I give as a sequel to this to a great extent, the evils attendant upon not too careful a manner in letting work, caused, I am compelled to say, by the easy manner in which some architects allow the work to be scheduled, thereby letting the carving slip into the schedule of a man who knows nothing whatever about the work—gets a price from Tom, Dick, and Harry, fills in the price of the highest, and if he succeeds in getting the building, bargains with the lowest, after taking something more off, for him to do the work.

This is what I will call the middle-man, and, as a rule, he does not care two straws so long that it is passable and he gets his money. The architect may feel aggrieved, and if the carver is a trifle conscientious, and they are sometimes, he may try to mend matters a little with the fervent hope that by so doing he may get into favour with the architect, and so by that get him to dispense with this middle-man who takes the cream for doing nothing.

(To be continued.)

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
December 28th, 1898.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slatz; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

OF recent years there has been an almost world-wide recrudescence of the Louis XVI. period of decoration. It is so dainty, so decorative, that even the mushroom millionaire in the Far West is not content without what he is pleased to call a "Louis" room. He does not sit there or live there; but he has it. The modern armchair is more comfortable, and infinitely uglier. Messrs. Duveen, in Bond Street, have purchased an entire room, of which the bronze gilt mounts are by the celebrated Gouthière, the inventor of "mat-gilding," who subsequently became "Ciseleur et d'Orure du Roi." It is perhaps difficult to agree with M. Paul Enel, who, in mentioning these pieces of furniture, declared that Gouthière was a great artist, who bade fair to take his place by the side of Benvenuto Cellini.

This is too great praise; nevertheless, his work is very fascinating. One of the small tables alone fetched £6000 at the Hamilton Palace sale in 1882. At Versailles there were at one time countless treasures. When the public sale was started it lasted for seven months. One of the pieces—the "Cabinet du Roi"—was sold for about £200. At the present moment it is in the Louvre, and it is valued at least at £20,000. The woodwork (or marqueterie) of Messrs. Duveen's collection is by Reisener, who was a master. The panels of old brocade are of exceptional richness; the frames for these are by Delafosse. It is a room well worth seeing by those who are fond of the period in question.

THE Ducal Palace at Venice is said to be in a dangerous condition. As usual, there are conflicting reports from pessimists and optimists; but even the latter class seem to admit that something must be done. That the structure needs repair is not surprising. Indeed, when we remember that Venice has grown up on some mudbanks in the lagoon, that it is an Amsterdam of the Adriatic, the marvel is, the Daily News thinks, that its palaces and churches have stood so well. The piles must have been driven deep, the wood have been sound, the substructures cunningly planned and honestly executed, or St. Mark's and its campanile, the Doge's Palace, the Prison, and the connecting Bridge of Sighs would long ago have disappeared. Next to St. Mark's the Palace is the most characteristic feature in Venice. It is, perhaps, even more conspicuous, for it is in full view from a considerable expanse of the principal canal, generally almost hiding the Cathedral, while the latter can only be fully seen from the Piazza di San Marco.

BUT the interior of the Palace is hardly less precious than the exterior to the lovers of Art. Tintoretto and Paolo Veronese have painted in fresco on its ceilings and walls. Any sudden subsidence might be fatal to their

work, even if the carved marble chimney-pieces and the pictures on canvas by these and other great Venetian artists were saved. But any serious injury to the fabric itself would, the contemporary above referred to points out, be an irreparable architectural loss. The present Palace does not, indeed, go back to the earlier days of the history of the Republic, though one was built on this site at the beginning of the Ninth Century, which was subsequently added to, or reconstructed. But the façade looking on the canal and that connected with it on the Diazetta, with the rich arcade of marble columns below, and the party-coloured walls above, date approximately from the earlier part of the fifteenth century, and the more ancient buildings were replaced by a Renaissance structure not long afterwards.

EVEN the more hopeful accounts seem to admit that considerable repairs are necessary. The architect must be called in; the restorer will find his opportunity, and his hand is generally heavy. In our own country we have had experience enough of this. Our forefathers in the last century often did mischief to cathedrals and churches. In many cases Ecclesiastical vandalism has effaced every link with the past history of the parish, and "translated" the church into a feeble resuscitation of a quassi-medieval place of worship. The Italian restorer is justly regarded with suspicion. Lovers of Florence are already crying out against his doings there. Those who knew Venice forty years ago have often had cause to execrate him during the latter half of that period. He has transformed the once wonderful Fondaco dei Turchi into a spick and span affair, worthy of a modern *café chantant*. He has meddled and muddled at St. Mark's; he has already been tampering with the Ducal Palace, and woe betide it if he gets a free hand there.

THE King of Siam is sending an envoy to India to receive the relics of Buddha, discovered some time ago on the Nepaul frontier, which were offered His Majesty by the Indian Government. It will probably be remembered that in January last a well-preserved stupa was opened at the village of Pipra hwa, on the Nepaul frontier, in the Basti district of the North-west Provinces. This village was in the Birdpur grant, a large property owned by Mr. William C. Peppé and his brother. Inside the building was found a large stone coffer, crystal and stealite vases, bone and ash relics, fragments of lime, plaster, and wooden vessels, and a large quantity of jewels and ornaments placed in two vases, in honour of the relics. A careful list was at once made of all the articles, and Mr. Peppé generously offered to place them at the disposal of the Government. The special interest of the discovery lies in the fact that the relics, in honour of which the stupa was erected, appear to be those of Gautama Buddha Sakya Muni himself, and may be the actual share of the relics taken by the Sakyas of Kapilavastir at the time of the cremation of Gautama Buddha. The inscription on one of the urns proves that the builders of the stupa believed the relics to be those of Gautama Buddha himself, and runs: "This relic receptacle of the Blessed Sakya Buddha is dedicated by the renowned brethren, with their sisters and their sons' wives." The characters of the record, Professor Bühner points out, do not mark medial long vowels, and appear to be older than those of the Asoka inscription.

THE actual relics being a matter of such intense interest to the Buddhist world were offered by the Indian Government to the King of Siam, who is the only existing Buddhist Monarch, with a proviso that he would not object to a portion of the relics being possessed to the Buddhists of Burma and Ceylon, and it was suggested that his Majesty should send a deputation to receive the sacred relics with due ceremonial. No relics of Buddha authenticated by a direct inscription have before been found in modern times, so the relics are as rare as they are unique, and by all Buddhists will be regarded as most sacred and holy objects of devotion. Their presentation to

SIDE CHAPEL, ST. CHARLES' CHURCH, HULL. JOSEPH H. HIRST, HON. ARCHITECT.

the King of Siam, the recognised head of the religion, is therefore highly proper. The accessories which were discovered will, it is understood, be distributed among the Imperial Museum at Calcutta, the Lucknow Provincial Museum, and perhaps the British Museum, Mr. Peppé retaining a reasonable number of duplicates for his own use. The stone coffer above referred to is over 4ft. in length and 2ft. in height. It is made out of a solid block of sandstone, and weighs about 16cwt. It is understood that the acknowledgments of the Government have been conveyed to Mr. Peppé for his public-spirited action in the matter.

IN the Chancery Division, before Mr. Justice Kekewich, a few days ago, the matter of Lord Donnington (*Campbell v. the Duke of Norfolk*) came up. This was an application in an administration action by Mr. John Hall, claiming to be a creditor upon the estate of the late Lord Donnington, in respect of damage which his manor house had suffered by subsidence, due to the working out of the main coal seam at Moira Colliery, Staffordshire. Lord Donnington, who possessed seats at Donnington Park, Derby; Loudon Castle, Ayrshire; Rawdon Hall, Yorkshire; and Willesley Hall, Ashby-de-la-Zouch, Leicester, died on July 24th, 1895, appointing the Duke of Norfolk and Mr. Lake, the defendants in the present action, his trustees and executors, with express direction that they should carry on this Moira Colliery. In November of the same year, cracks appeared in the walls of Mr. Hall's manor house, the ceilings, and other parts, which gradually extended, and threatened the stability of the structure. That the mischief was due to coal working was not denied; but it having happened after Lord Donnington's death, a question arose in law

whether a claim for damages could be made against his Lordship's estate in an administrative action.

MR. M'SWINNEY, in support of the application, argued that he was entitled to recover against the trustees, as although he had had no cause of action during Lord Donnington's lifetime, the working of coal, which ultimately brought about the subsidence, took place in that period. If he failed on that ground, he said that the subsidence took place while the trustees were carrying on the colliery by express direction, that the trustees were entitled to be indemnified out of the estate, and his client to be indemnified by the trustees for the serious losses he had sustained.—Without calling upon Mr. Parker for the trustees, Mr. Justice Kekewich delivered judgment, observing that it was admitted that, had this subsidence occurred during Lord Donnington's lifetime, there would have been right of action against him, and the action would not have fallen through by his death. It was said that the act which caused the injury was Lord Donnington's act, and that as soon as its effects became plain, though Lord Donnington was dead, Mr. Hall's right of action arose. Whom should he sue? His claim was to sue the dead man, but this could not be done in a common law action. Mr. Hall had no right to claim in the administration action unless he had a claim against the deceased's estate; but there could be no claim against the estate except there was previously such a claim against Lord Donnington. The complete answer to the case set up was, that Mr. Hall was not claiming against the heir-at-law, but against the estate of the deceased, and in that respect he had no claim. Accordingly the application was dismissed.

THE chapel which is illustrated on this page has lately been constructed at the south end of one of the aisles of St. Charles' Church, Hull, and is designed to harmonise with the church, which is in Italian Renaissance. The new chapel is entered through a double arch carried upon four massive pilasters, and the whole of its area is surmounted by a pannelled dome in fibrous plaster. Above the dome is an ornamental lantern filled in with tinted glass. The arches and pendentives supporting the dome spring from a cornice carried upon fluted pilasters. A semi-dome thrown over the space occupied by the altar is suggestive of a baldachino. Light falls directly upon the altar through a small lantern hidden above the semi-dome. Electricity has been introduced, and a very fine effect is produced by lamps which are fixed out of sight near the springing of the dome. The decorative work is chiefly in fibrous plaster, executed by Messrs. G. Jackson and Sons, of London, and the tiled floor, specially designed, has been carried out by Messrs. Minton, Hollins and Co. The paintings and enrichments, which are of an exceedingly ornate character, are by Mons. Henri Immenkamp, of Munich. The chapel has been designed gratuitously by Mr. Joseph H. Hirst, M.S.A., one of the churchwardens.

At the Fine Art Society in Bond Street there is an exhibition of pictures and sketches by Mr. Albert Goodwin. The main features are a series of sketches of "Whitby," and a large canvas, "The First Christmas Dawn." This last is the only disappointing picture in a most interesting collection. Mr. Goodwin has an art that is curiously individual; his touch, especially in light watercolours, is light, delicate. His feeling is invariably poetic, and, whether he sets himself to make an impression of a scene in Europe or the Orient, he always gives you the conviction that he sees through the eyes of an artist rather than through those of the craftsman.

ONE of the oldest landmarks of Paris is destined to disappear under the stress of modern improvements. There has existed at the corner of the Rue St. Denis and the Rue des Prêcheurs a singular sign representing a tree with many branches, each of which ends in a wreath containing a name. It is called "L'Arbre de Jesse," and is a rough representation of the genealogy of Our Lord from Jesse, father of King David. In mediæval Paris there were a number of these signs, but this was the sole survivor from the Revolution, during which all the rest were destroyed. It will be transferred to the Musée Carnavalet.

ST. NICHOLAS CHURCH, at Strood, near Rochester, caught fire on Saturday week, and the flames for some time raged fiercely. The local fire brigade, however, then were able to check the fire, and in the result the main structure was saved, but the interior was extensively damaged. The tower bells and clock were destroyed. The church is interesting for two reasons. It has borne the reputation of being the ugliest church in the county of Kent, although now that the "clasping ivy" covers portions of its walls its plainness is somewhat toned down. Its form is that of an oblong square, 79ft. in length, 56ft. in breadth, and 31ft. in height. The second reason is that the ratepayers of Strood still pay compulsory church rates. The original church, erected about 1158, was pulled down in 1812, under the authority of a special Act of Parliament, only the tower being left, and the cost of rebuilding was made a charge upon the rates—a liability which is not yet extinguished. So far as is known, there is no other case of the kind in England. The tower is burnt out—only the bare walls remaining—and the vane, turret, bells, and clock are destroyed.

A CORRESPONDENT writes:—"Our Florence papers continue to comment somewhat severely on a mischievous rumour circulated in Florence to the effect that the authorities intended to 'improve' the city by taking down some of

its most ancient and picturesque sites. This report was too wild for it to obtain any credence from residents; but it was believed by some English patrons of Art, resident in England, who addressed a protest to the Syndic of Florence. This official replied in courteous terms, showing clearly how unnecessary was their expression of anxiety. The *Nazione*, which gives the whole correspondence, points out that the character of the authorities and the labours of the Italian Committee might have protected them from unfounded rumours from abroad."

We understand that when Professor A. H. Church, F.R.S., resumes work next year upon the wall paintings in the Palace of Westminster, he will probably bring into use a new apparatus which has been constructed to his order for the better cleansing of these beautiful frescoes. The object of this machine is to produce, by means of a manual air compressor, a powerful air jet charged with breadcrumbs, which are distributed over the surface of the picture. It was first tried last autumn in the Royal Gallery, where Maclise's famous paintings are situated, but had to be sent back to the makers in order that certain alterations in its construction might be effected, but even when this were done it did not prove altogether satisfactory. During next summer the Professor proposes to cleanse once again the whole of the frescoes in the House of Lords, as well as the four glazed paintings in the Peers and Commons corridors, the surfaces of which are covered with numerous dark patches which he believes to be of fungoid growth.

PLANS of the pavilions of foreign nations are now fast coming in to the Commissary-General of the Exhibition of 1900. These constructions are to be raised on the left bank of the Seine, between the Esplanade des Invalides and the Champ de Mars, and will form a Rue des Nations. The Italians have presented two projects, one of which shows a building of composite Architecture, Venetian, Byzantine, and Moorish, and it is this construction that will, no doubt, be seen in 1900. The Hungarians propose to build a pavilion in Flamboyant style, with a frontage like that of a mediæval castle or country residence, to which part of a chapel and of a fortress will be attached. From Finland comes a plan for a construction on Northern lines. To these may be added the old English mansion and the mediæval German house, and schemes from other countries are shortly expected.

SOME valuable porcelain, objects of Art, and other curiosities from various private sources came under the hammer at Christie's. A pair of old Nankin oviform jars and covers, measuring only 10in. high, realised 780 guineas; an old Dresden cabaret, of quatrefoil form, painted with Watteau figures, consisting of small urn and cover, coffee jug, cover and stand, sucrier and cover, canister and cover, a pair of tea and coffee cups and two saucers (from S. Addington's collection), sold for 270 guineas; and a pair of beakers (from the same collection), 185 guineas.

DEVIL'S BRIDGES are to be found all over the world. The most famous is the bridge over the Reuss, in the Swiss canton of Uri, on the St. Gothard Road, where the river, which is 4593ft. above the sea level, forms a picturesque cascade of 100ft. There is also a Devil's Bridge, spanning a mountain torrent, near the Ceret in the Pyrenees. Another famous Devil's Bridge is to be found near Aberystwith, in Cardiganshire. This bridge spans a gorge 114ft. deep, through which the Mynach rushes, making four falls of from 18ft. to 110ft. within a very short distance. The Devil's Road runs through many lands, and various mountains at home and abroad have been named after Satan.

A COMMITTEE of leading engineers has approached the London County Council with a view to the placing on the Victoria Embank-

ment of a memorial tablet to Sir Joseph W. Bazalgette, the well-known engineer of the old Metropolitan Board of Works, to whose skill the metropolis owes the construction of the Thames Embankment, and the establishment of the present magnificent system of main drainage. The question has been favourably considered by the General Purposes Committee of the Council, and a proposal will probably be made at the next meeting of the Council that the tablet should be affixed to the carriage-way side of the wall of the Embankment, close to the floating fire brigade station, near Charing Cross Pier.

CULLEN is developing into a resort for artists, the picturesque scenery along the coast in the neighbourhood lending itself readily to artistic effects. Mr. L. Stuart has placed on view a collection of his recent

works. The pictures now all show careful drawing, fine feeling, and broad artistic effect. They consist of pencil drawings and studies of various kinds, watercolour drawings, sea sketches, and larger canvases of local features. One of the last represents Cullen Bay and the Three Kings, with the Scar Nose in the background. Another is an admirable view of Portknockie Harbour, with boats discharging fish. The mouth of Cullen Burn, with children wading, is a skilful piece of work. Next we have the beach at Sunnyside, with sheep in the foreground. A near view of the river Spey, with Ben Rinnes in the distance, forms a capital picture. Mr. Stuart has been very successful in representing storms, as his sketches of Cullen Bay show. The exhibition also includes three clever portrait sketches by student friends, an interesting picture of an old man standing before a fire, and some water-colour sketches of English scenery.

VIEW OF CHANCEL.

ACCOMMODATION 629

CHURCH OF ST. ANDREW, ORPINGTON, KENT.

MESSRS. J. E. NEWBERRY AND E. HIDE, ARCHITECTS.

Professional Items.

ARBROATH.—Designs for the memorial windows to be erected in Inverbrothock Free Church have been laid before the Deacons' Court. The design of Mr. William Pearce, Birmingham, was recommended. The design represents the Birth, Crucifixion, and Resurrection. The memorial windows are to be placed in the apse of the church behind the pulpit.

BARNSELY.—The Mayor of Barnsley has opened a new theatre at Barnsley. The new building stands on the site of the old theatre in Wellington Street, but occupies double the area of the old structure. The seating accommodation is for 1200. The height of the auditorium to lantern light is 45ft. The exits and entrances are all on the latest principles, and every precaution against fire has been taken. Refreshment rooms are provided for the pit, circle, and gallery. The entrance hall is commodious and handsomely fitted. The stage is 30ft. 6in. deep, and 50ft. 6in. wide, and the proscenium opening is 28ft. wide by 28ft. high. Commodious dressing rooms have been provided. The decorative work inside is pleasing. The prevailing colours are cream and gold, electric blue, and bronze and gold. The dome is a beautiful work of Art, the subjects of the panels being music, drama, painting, and comedy. The design is by Mr. Walter Emden, of London, and the building has been in the hands of Mr. Herbert Crawshaw, architect, of Barnsley.

BRISTOL.—Requiring space for the extension of their premises, the directors of the Bristol United Breweries Limited, have purchased the All Saints Almshouses adjoining the Crown and Dove Hotel in Bridewell Street. The plans for the new building have been prepared by Mr. T. Scammell, and the contractor is Mr. A. J. Beaven, of Bedminster.

CLOUGHTON.—The memorial window erected in the parish church at Cloughton, Yorkshire, in memory of the late Sir Frank Lockwood, Q.C., was dedicated by Canon Temple, of York, in the presence of a large number of people, including many of the late Sir Frank's constituents from York. The design was furnished by Messrs. Atkinson Brothers, of Newcastle, and the subject illustrated is the Judgment of Solomon. In the centre light is an impressive figure of the King in the act of giving judgment. It is draped in an under-robe of white, richly diapered with gold, with an over-cloak of brownish ruby. At the sides are the two mothers, one with her dead child at her knees, the other clasping her living child to her breast. The left hand figure is clad in an underdress of soft dull blue and an ivory-toned cloak; the right-hand one in olive green, and white cloak with gold lining. A secondary figure is a soldier with a drawn sword, ready to carry into effect Solomon's award. The canopies and bases, which are architectural in treatment, are of a soft greenish white, relieved with gold. In a niche in the centre canopy is an angel holding the emblem of justice. In the tracery above is an angelic host bearing crowns, palms, and the like, emblematic of victory. With the surplus funds a lych gate was erected by Messrs. Smith, Brodrick, and Lowther, architects, of Hull.

CODDENHAM.—A further step in the restoration of the fine old parish church of Coddenham was marked when a new reredos was dedicated, and the completion of the work carried out in the porch was signified. The reredos, which is the gift of Mr. Harry Wyles, is in carved oak, with figured panels in relief and painted, and was executed by Messrs. Percy Bacon and Brothers, London.

EDINBURGH.—The New Greyfriars Parish Church, recently decorated and fitted with electric lights, has now had its large west window filled with stained glass. The central design is the Resurrection, and is composed of a large group of the two angels at the

sepulchre, while the figure of the risen Lord occupies the arched space above. On either side of the central light are correspondingly large sidelights, which contain figures of "Mary, the mother of Jesus," and "John, the beloved disciple." The artists, Messrs. Ballantine and Gardiner, have produced the general colouring in warm gradations, attaining in the more important parts of the design great depth and richness.

HARROGATE.—The foundation stone of the new Technical School, Harrogate, has just been laid. The building will be situated at the junction of East Parade and Bower Road, the principal entrance facing Haywra Crescent. The portion at present being erected contains the following rooms:—On the ground floor is a cooking room, with scullery and store room adjoining, a room for building construction, and, in connection with the Art Department, a room for advanced modelling, and a large room for life and antique study; two class rooms are also provided on this floor for book-keeping, dressmaking, and other purposes. On the first floor are lecture room and painting room en suite, and headmaster's room adjoining; a physics laboratory and a chemical laboratory and lecture room, with balance and store rooms attached. On the basement are a manual room and a large spare room, besides the usual provision for heating and other

cellars. The staircase is in a central position, and conveniently placed for access to all departments. The corridors are also of good width, and are well lighted. The lavatory accommodation is also well placed and ventilated. The exterior is designed in a simple style of Renaissance. The corridors and laboratories will be lined with glazed bricks, dado height. The building, when eventually completed, will contain six or seven additional rooms. It is being built as cheaply as possible. The building is being carried out by Mr. W. J. Morley, F.R.I.B.A., architect, of Bradford and Harrogate, whose design was selected in competition. The contractors are:—Mr. R. Airtou, mason; Mr. Linskill, joiner; Messrs. Fortune and Calverley, plasterers; Mr. Shepherd, slater (all the above of Harrogate); Mr. G. Thompson, plumber, Leeds; Mr. F. Houldsworth, painter, Saltairé. Mr. Easton is acting as clerk of works.

SWALWELL.—The Presbyterian Hall at Swalwell has just been opened. The new building stands directly opposite the old church in Market Lane. The total cost of the new hall will be £1200. The building is in brickwork, with selected Birtley brick facing, and designed in a plain treatment of Renaissance. Messrs. Badenoch and Bruce, of Newcastle, were the architects, and the contractor Mr. H. Atkinson, of Blaydon.

NEW JUBILEE CLOCK TOWER AT SKEGNESS. E. WINTER, ARCHITECT.

Under Discussion.

LIVERPOOL GEOLOGICAL SOCIETY.

At a meeting of the Liverpool Geological Society, Mr. Mallard Reade read a paper on "The Gypsum Boulder of Great Crosby," in which he described the finding of the huge boulder in the brick pit of Mr. Edward Peters, Cook's Lane, Great Crosby, at a depth of 20ft. below the surface at a level not much above ordnance datum. It was a solid mass of alabaster, weighing about eighteen tons, and lay embedded in stiff plastic boulder clay containing the remains of marine organisms. The district council, on the urgent representation of Mr. Reade, backed up by the Liverpool Geological Society, accepted Mr. Peters' offer of the boulder, and, acting in a public-spirited manner, have gone to the expense of setting it up in Islington, Great Crosby, where it is now to be seen.

SIENA AND BALDASSARE PERUZZI.

At a recent meeting of the Leeds and Yorkshire Architectural Society a paper was read by Mr. Francis W. Bedford, A.R.I.B.A., entitled, "Siena and Baldassare Peruzzi." The lecturer gave a description of Siena and of the country round. Its population, he pointed out, was only a quarter of what it was in the mediæval days. It was full of old palaces more or less in ruins. Its cathedral was in marble, inlaid with mosaics, and had statues by Michael Angelo, Donatello, and paintings by Raphael and Pinturicchio. Its choir stalls were amongst the finest in the world, and its pulpit a seven days' wonder. Mr. Bedford gave an account of the life and work of Baldassare Peruzzi, who, besides being an architect, was a skilled painter. The lecture was illustrated with lantern slides.

SAXON CARVING.

At the last meeting of the Society of Antiquaries the Rev. W. K. W. Chafy exhibited a carved stone of the Anglo-Saxon period recently discovered at Rous Lench Church, Worcestershire. The interest of this relic lies in the unusual symbolic devices with which it is decorated. The subject of the sculpture consists of a man and a pair of peacocks entirely surrounded by conventional foliage with interlacing branches and bunches of fruit. The man holds a billhook or sickle in his right hand, and in his left a bunch of fruit, which the peacocks are pecking at. In one respect the stone is unique, as this is the first time that a representation of a peacock has been found either in Saxon or Norman sculpture in Great Britain.

CARDIFF MASTER BUILDERS.

The members of the Cardiff Master Builders' Association held their annual banquet on Thursday week. Mr. J. E. Turner, President of the Association, was in the chair.—The toast of 'Architects and Surveyors' was proposed by Mr. W. Symonds, President of the South Wales and West of England Federation of Building Trades Employers, who congratulated the company present on the success of that gathering, and on the improved relations that now existed between architects and builders. He believed the architects and surveyors endeavoured to hold the balance fairly between both parties—those who were paying for the erection of a building, and those who were putting it up.—Mr. C. B. Fowler, President of the South Wales and Monmouthshire Architects' Society, acknowledged the toast, and spoke in high terms of the friendly relations that existed between architects and contractors in South Wales. He mentioned that a joint meeting was to be held shortly in London, when an attempt would be made to adopt a universal form of contract, which would be a good thing for both architects and contractors.—Other toasts followed.

SCOTTISH SURVEYORS.

A meeting of the members of the Surveyors' Institution practising in Scotland was held

in the Masonic Halls, Glasgow. Mr. Thomas Binnie presided. It was reported that the membership had been largely increased since last meeting, and now included surveyors, estate factors, and valuers practising in various districts in Scotland, from Orkney to Dumfries. Mr. Binnie afterwards delivered an address, in which he referred particularly to the responsibility of surveyors, and the large interests involved in advising clients as to matters connected with heritage.

SOCIETY OF ENGINEERS.

Mr. W. Worby Beaumont presided at the forty-fifth annual dinner of this Society, which was held on Wednesday in the Victoria Hall of the Hotel Cecil. Among the guests were Sir Benjamin Baker, Sir J. Durston, General Sir O. Tanner, Mr. W. H. Preece, Mr. W. H. M. Christie (Astronomer Royal), Mr. Alex. Siemens, Mr. J. W. Swan, the Hon. C. S. Rolls, Mr. John Aird, M.P., Mr. J. C. Fell, and the secretary, Mr. G. A. Pryce Cuxson, who during the evening was presented, on his retirement from the office after ten years of zealous work, with an address on vellum and a tea and coffee service. Following the usual loyal toasts, "Prosperity to the Society of Engineers" was proposed by Mr. A. J. Walter, who said that engineering was always bound to be a potent factor in the development of the resources of the realm.—The President, in replying, spoke of the great advances made in engineering science of late years, and emphasised the point that at the present time the cheapness of articles which used to be from twenty to a hundred times as dear, was due to the perfection of engineering enterprise and expenditure of capital.—Mr. Preece, president of the Institute of Civil Engineers, next proposed "Engineering Enterprise," and spoke of the leaps and bounds which characterised the progress that science had made for the comfort and convenience of citizens, whether dwelling on land or travelling on the sea.

FOUNDATIONS AND SHORING.

The usual meeting of the Glasgow and West of Scotland Technical College Architectural Craftsmen Society was held last Friday week, when papers were read by Mr. John Bowman and Mr. Wm. H. Baxter.—Mr. Bowman took for his subject "Difficulties with foundations." He prefaced his remarks by explaining that the points he would touch upon had come under his own observation in a building where he was engaged as Inspector of Works. The difficulties in the site were numerous, owing to part of it being at one time used as a quarry. He explained the methods he adopted in overcoming them. Underpinning, which had to be done to some of the adjoining buildings and hollow walls, was also touched on. The lecturer made good use of the blackboard in drawing details of the site, foundations, etc., and the methods he resorted to in overcoming his difficulties.—Mr. Baxter delivered a paper on "Shoring and Slapping." In introducing his subject the lecturer emphasised the fact that quite a number of tradesmen do not know anything of the difficult and risky operation of shoring and slapping old buildings. He said that it is quite a tempting of Providence the way in which a number of alterations were carried out. He then went into the subject very fully, and explained both needle raking, shoring, and slapping as carried out in Glasgow. Raking shoring was not much used there, owing to stone being so much employed instead of brick. In slapping, the position of the new beams and columns should be taken into account, supports should be under the ribs of the openings above; chimney-breasts should be supported, and all windows should be braced. He mentioned that he had no faith in cast-iron needles, as they were not so reliable as steel beams. Needles should not be wedged and driven tight more than was necessary, as the additional stress is apt to shake the building.—A number of diagrams were on exhibition illustrating this paper.

Enquiry Department.

MATHEMATICAL INSTRUMENTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I should be glad if some of your readers would inform me through your enquiry column of some book explaining fully the figures and lines given on a first-class steel square, with a 2ft. blade and 18in. tongue.—Yours truly,

G. W. B.
November 11th, 1898.

Surely you can find someone who can explain the use of your square much more effectually and more readily than you can acquire the explanation from a book! The following books, however, deal exhaustively with your subject: H. D. Mahan's "Industrial Drawing: Use of Instruments, etc.," F. W. Simm's "Mathematical and Drawing Instruments," W. F. Stanley's "Descriptive Treatise on Mathematical Instruments."

PATENTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Can you tell me where I can get information as to taking out protections and patents, or if there is any book on the subject?—Yours faithfully,

Dec. 19th, 1898.

The only works on the subject are the small pamphlets issued by the various firms of patent agents. Your best plan would be to consult a good patent agent, who would supply you with information free. If your idea is upon an architectural or building matter, we can supply you with the name of a firm who will be able to do your work.

MILL SHEDS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will any of your readers who have had experience in the erection of mill shedding kindly favour me with their views on the following case? I have erected a long range of "saw tooth roofs," iron principals, and entirely supported on C.I. columns, the bays being about 85ft. long and 23ft. wide, the distance apart of the columns being originally about 22ft. The roof was not designed to bear the pull of shafting, but subsequently a scheme of shafting was introduced, intermediate columns of C.I. being fixed, reducing the span of the girders to about 11ft., or half the original span. The shafting is fixed on brackets with collars bolted to the columns. The engine works an indicated h.p. of 36. Now, I find numerous small leakages throughout the roof, and am inclined to attribute it to the vibration of the machinery. I have tested the roof, and find the vibration very marked, and pulsating in the 5in. column to which is attached the main drive and fly-wheel (4ft. diameter), but scarcely noticeable elsewhere. I should feel very grateful for any hints as to how the defect may be remedied and for similar experiences.

Is there any formulae for readily calculating the "pull" which a girder and column under may be expected to bear (a) without danger of accident, (b) which may be applied without the risk of excessive or mischievous vibration? The machinery usually works 160 revolutions per minute.—Yours, &c., "ALPHA."

P.S.—May I ask further if any of your readers happen to know of a good gulley trap grating capable of being locked like a manhole, also similar cover for Armstrong eyes? I have had much trouble in school playgrounds on account of their fittings being tampered with by children. Recently I took a couple of bricks, &c., out of an Armstrong eye.

ON Wednesday, the Whitechapel Board of Guardians received a communication from the Local Government Board consenting to the guardians purchasing sites for their cottage homes for children belonging to the union at Grays Thurrock, Essex, at a cost of £2600.

Views and Reviews.

LONDON UNIVERSITY GUIDE.

That the University Correspondence College is widely appreciated is evidenced from the number of successful candidates at matriculation and at the examination in Arts, Science, and Law, 27.6 per cent. passing during the twelve months ending August 31, 1898. During this period the students have taken not only 36.4 per cent. of the places in the honours list at the Intermediate and Bachelor Examinations in Art, Science, and Law, but occupy 44 per cent. of the M.A. list. The report of this College contained in their Guide and Calendar for 1898-9 is well worth reading, and the guide itself contains a great deal of useful information.

"London University Guide and University Correspondence College Calendar, 1898-9." Gratis. University Correspondence College Press, Burlington House, Cambridge.

LIGHT AND AIR.

Mr. Hudson's book on building contracts is so well known that a volume from his pen on light and air cannot fail to be appreciated. Simple as the subject appears to be at first sight, the application of the law of easements to light and air cases bristles with pitfalls, as many an architect knows to his cost. Mr. Hudson's work should go far towards making its comprehension easier, while it has the advantage of being of a convenient size, neither so small as to be over condensed, nor so large as to be cumbersome; containing all necessary information, together with the latest decisions upon important points.

"The Law on Light and Air." By Alfred A. Hudson and Arnold Inman. London: Estates Gazette Office, 6, St. Bride St. East, E.C.; Sweet and Maxwell, Ltd., 3, Chancery Lane, W.C.

THE funeral of Mr. John Gülich, R.I., took place on Thursday week. At the last meeting of the Royal Institute of Painters in Water Colours, Mr. Gülich was elected a member of the Hanging Committee. An offer for his picture "The Violin Concerto," which was exhibited at the last exhibition of the Institute, has been made by the Liverpool Corporation, but his family now desire to retain the picture for themselves.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BALLYSILLAN (Belfast).—For the construction of a covered concrete reservoir, Ballysillan. Mr. Acheson Ferguson, 35, Royal Avenue, Belfast, surveyor:—
W. J. Campbell & Son £11,900 | Courtney and Co. £10,590
J. McKee and Sons 11,083 | H. & J. Martin, Ltd. 10,430
J. and W. Stewart 10,943 | H. Lavery & Sons, Cam-
W. McLarnon 10,548 | bridge-street, Belfast 10,400

BARKING (Essex).—Accepted. For erection of 83 cottages for the working classes in Crooksmouth-lane, Barking, in blocks as follows, for the Urban District Council: (Block A) 13 cottages, (B) 12, (C) 15, (D) 16, (E) 15, (F) 12. Mr. C. J. Dawson, F.R.I.B.A., East-street, Barking, surveyor:—
J. J. Reeve 220,600 | J. C. Garbett £16,300
E. Hughes 20,543 | H. Lane, East Ham 12,750
*Accepted subject to sanction of the Local Government Board.

BARNSELY.—Accepted for the construction of streets, &c., Park-grove, for the Land Society. Messrs. Wade and Turner, surveyors, 10, Pitt-street, Barnsley. Quantities by the surveyors:—

For 1, 2, and 3 Sections.
Henry Burrows and Sons, Barnsley £1,783 8 6
For 4, 5, 6, and 7 Sections.
Fred Walker, Park Grove, Barnsley £133 19 2

BARNSELY.—For erection of electricity works, for the Corporation. Mr. J. H. Taylor, A.M.I.C.E., borough surveyor. Tenders recommended for acceptance:—
Tall chimney.—G. Mellor £290 0 0
Bricklayers, Masons, &c.—J. K. Taylor & Son 1,242 0 0
Carpenters and Joiners.—Robinson and Son 385 0 0
Plasterer.—Fleming 57 0 0
Slater.—Fleming 113 0 0
Plumber and Glazier.—S. Rushforth 87 0 0
Smith and Founder.—Newton, Chambers & Co. 466 19 8
Painter.—T. L. Stephenson 40 0 0

BARNSELY.—For supply of plant, &c., to the electricity works, for the Corporation. Mr. J. H. Taylor, A.M.I.C.E., borough surveyor. Tenders recommended for acceptance:—

Boilers.
W. Arnold and Co. £2,200 0 0
Engines, Dynamos, Plant, &c.
Johnson and Phillips 8,030 0 0
Storage Batteries, &c.
Pritchetts and Gold 1,319 0 0
And £70 per annum for annual maintenance of batteries.

Electrical Mains, &c.
British Insulated Wire Company 6,322 4 2
And £110 per annum for maintenance.

BELFAST.—For the construction of a covered concrete reservoir, Ballysillan. Mr. Acheson Ferguson, surveyor, 35, Royal Avenue, Belfast:—

W. J. Campbell & Son £11,900 | H. & J. Martin, Ltd. £10,430
J. McKee and Sons 11,083 | Henry Lavery & Sons,
J. and W. Stewart 10,943 | Cambridge-street,
Wm. McLarnon 10,548 | Belfast 10,400
Courtney and Co. 10,590 | *Accepted.

BLACKPOOL.—For the erection of a new Collegiate School, South Shore, for F. T. Pennington, Esq. Quantities by the architect, Mr. E. Grubb, 13, Rawcliffe-street, South Shore, Blackpool:—

W. Chadwick £737 13 6 | J. M. Kether, Ltd. £298 10 0
T. Lawson and Co. 660 0 0 | J. Porter 565 0 0
F. Saville 650 0 0 | C. Crighton 564 0 0
G. H. Fisher 637 0 0 | *Accepted.

Total of lowest separate tenders, £588 14 6.
BROMSGROVE.—For the construction of sewers, Pedmore, for the Rural District Council. Mr. E. B. Martin, G.E., Church-street, Chambers, Stourbridge:—
Jacob Briggs £4,310 0 0 | Thos. Vale £2,474 10 0
Geo. Trentham 2,951 4 0 | W. L. Meredith 2,331 15 1
Geo. Law 2,482 9 0 | John Mackay 1,995 14 0

C. Wall ... 23,887 J. Chessum and Son 21,070
Wall and Co. ... 22,906

Note.—Tenders referred to Works Committee.

WEST HAM.—For erection of a Quarter Sessions Court, for the West Ham Town Council:—

Symes ... £10,650 Chessum and Sons ... £9,699
Porter ... 10,111

[Borough engineer's estimate, £10,000.]
Note.—The tenders were referred to Works Committee.

CONTRACTS OPEN.

GLASGOW AND PAISLEY JOINT RAILWAY.

SHIELDHALL BRANCH CONTRACT.

The Glasgow and Paisley Joint Railway Committee invites TENDERS for the DOUBLING of the SHIELDHALL BRANCH, the BUILDING of a GOODS SHED, with Offices, and for other Works in connection with the same.

The Drawings may be seen, and, on payment of a deposit of Two Guineas, which will be returned on receipt of a bona fide Tender, a copy of the specification and Schedule and Quantities, with Form of Tender, may be obtained, at the Office of the Company's Engineer, Mr. T. J. NICHOLLS, M. Inst. C.E., 14 Bridge-street, Glasgow.

Tenders, in covers, sealed and endorsed "Tender for Shieldhall Branch, &c.," must reach the undersigned not later than THURSDAY, 5th January, 1899.

The Joint Committee will not necessarily accept the lowest or any other Tender.

14, Bridge-street, Glasgow,
13th December, 1898.

R. G. WADDELL.
Secretary.

ISLINGTON VESTRY. TO HOUSEBREAKERS, BUILDERS, AND OTHERS.

DEMOLITION of BUILDINGS abutting on site of Electric Lighting Station, Eden-grove, Holloway-road, N. (near Holloway Station, Great Northern Railway).

The Electric Lighting Committee of the Islington Vestry invite TENDERS for the PULLING DOWN and REMOVAL of certain BUILDINGS abutting on the site of the Vestry's Electric Lighting Station.

Particulars and forms of Tender supplied on application at the Vestry Hall.

Tenders, addressed to the undersigned, and endorsed "Tender for Demolition," to be delivered at the Vestry Hall, Upper-street, N., not later than FIVE p.m. on WEDNESDAY, JANUARY 11th, 1899.

WM. F. DEWEY,

Vestry Hall, Vestry Clerk.

Upper-street, N.,
December 15th, 1898.

HALL'S

SANITARY
WASHABLE DISTEMPER
(PATENTED),

A NEW SANITARY WATER PAINT,

HAS great advantages, some of which are as follows:

It Sets Hard, Kills Vermin, and Disinfects.

It is Washable in 3 Weeks, Does not Scale, can be Painted or Varnished, and will Stand Inside or Outside.

It is made in Dark Rich Shades as well as in Light Tints, contains no Lead, and Does Not Turn Black.

It only requires the addition of Water to make it ready for use, so that anybody can apply it.

It is Cheaper, Cleaner, Healthier, and more Artistic than Wall Paper.

It is Sold by leading Chemists, Drysalts and Ironmongers, and Manufactured by

SISSONS BROTHERS AND CO. Limited, HULL,

From whom Samples, Shade Card, and other particulars can be obtained.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

CONDITIONS WHICH RENDER HOUSES UNHEALTHY.*

By JAS. I. LITTLE,

Late County Sanitary Inspector, Renfrewshire.

THE conditions which render houses unhealthy are numerous—might almost be said to be innumerable—as from whatever point of view you study the construction of houses, whether it be the dwelling itself or its site, whether it be the Architecture or structure, or whether it be the internal arrangements or the surroundings, something can be pointed out which will contribute to the discomfort of life, or tend to depreciate the physical condition of man. The health officer may lay down the principles upon which the healthy construction of houses should rest, but unless the architect and craftsman apply these principles, the house cannot be healthy. Before proceeding further, however, it is advisable for you clearly to understand that, for a house to be unhealthy does not necessarily imply that the occupation of that house will kill the parties inhabiting it in much the same manner as a dose of arsenic will kill a human being. We have various decisions and opinions of authorities which bear this out.

Sir Henry Littlejohn expressed the following opinion:—"The phrase 'injurious to health' is construed by various medical men in different senses. If actual injury to health have to be proved, it will be found almost impossible to reach this description of nuisance. I venture to express the opinion, that when smells from whatever cause are declared to be very offensive, and produce feelings of nausea or sickness in those exposed to them, and when these smells in certain directions of the wind so invest houses as to prevent proper ventilation, medical men should have no hesitation in describing them as *injurious to health*."

In a case regarding the closing of a churchyard, Sheriff Davidson, of Midlothian, remarked:—"It is maintained that it has not been proved that the mode of conducting the churchyard is injurious to health. This is not a question that requires medical or other scientific evidence; it is patent to the common sense of every intelligent man. It is not at all surprising that the petitioners should not have been able to bring proof that particular individuals have suffered from the effects of a foul atmosphere in this churchyard. It is not easy to fix on the exact place and time at which a person whose body happens to be in an apt state has caught infection."

Then, again, the word "nuisance" was defined by Lord Chancellor Selborne in the following terms:—"What causes material discomfort and annoyance for the ordinary purposes of life to a man's house or to his property is to be restrained, . . . and although the evidence does not go to the length of proving that health is in danger, I will say no more than that the conclusion seems necessarily and properly to follow."

The opinion of Lord Young, Lord Gordon, and Sheriff Munro, to the Board of Supervision in 1872, as to what kind of offensiveness would require to be proved, was:—"We find it impossible, usefully, to say more than that the offensiveness must be such as seriously to interfere with the comfort of life in the neighbourhood, and such as may be detrimental to health, although it should be impossible to prove that it has been or necessarily must be so."

A house to be healthy depends much upon its construction and site, so that it may be furnished with the three essentials of life—light, air, and water. Unfortunately, wherever we turn, we will see dwelling houses defectively supplied with one or other of these. The sunlight may be intercepted by a canopy of smoke, or, from the arrangement of

the building, unable to enter our rooms; the air may be rendered impure from various causes, or may be confined or excluded by the structure of the buildings from performing its proper functions; the water may be derived from a contaminated source, or, if a plentiful and good water supply be provided, it may become polluted or impregnated with injurious matter in its course of transit to the house. In our towns the impurity of the air is the chief cause of unhealthy houses, whereas in the country the water supply is the chief source of anxiety.

Year by year the necessity to preserve and render our dwellings healthy becomes more imperative, the population is day by day becoming more crowded together, our pursuits are becoming more sedentary, our habits more luxurious, houses are increasing in number, land is becoming more valuable, the young are being reared among stone walls as green fields become more remote, and the public health can only be maintained and improved by giving the strictest attention to sanitation.

Laws alone can do little to remove or prevent sanitary defects in and around dwellings. The Government and the local authority may assist by spreading through the community the knowledge of what is necessary, and may publish practical methods of applying that knowledge, but real and permanent healthy dwellings can only be introduced by the people themselves, each in his own sphere—the engineer in laying out and preparing the sites, the architect in designing, the craftsman in constructing, and the occupiers in properly using the dwellings prepared for them by obeying the laws of health. The laws of health are only the laws of common-sense, and the simplest methods of applying them are generally found the most effectual. To preserve health man must be prepared to ward off disease, and, to accomplish this, he must be brought to understand his sanitary surroundings, to act in accordance with the laws of Nature, and to keep his person and habitation clean. Our dwellings greatly influence the atmosphere in which we live, and according to the degree of cleanliness in which they are kept will depend the comfort of the inmates.

LIGHT.

An insufficient supply of light will render a house unhealthy. The 173rd section of the Burgh Police (Scotland) Act, 1892, defines very clearly the amount of light necessary in a house: "Every habitable room shall have at least one window, and the total area of glass in the windows, clear of the frame and sash, shall be at least one-tenth of the area of the room." Unfortunately, that only applies to new buildings, and, unfortunately, it does not specify the window to be in an outside wall or overlooking an open space. Light, however, is necessary in every house. Where there is no light there is sure to be dirt; and where there is dirt and no fresh air there is sure to be a close and unwholesome smell. This of itself is sufficient to sap and undermine the general health and constitution of the unfortunate people who inhabit such houses, making them naturally liable to disease. Vigorous and exuberant health requires both light and air to sustain it, and the full attainment of these in all dwellings, whether for rich or poor, cannot be too often or too seriously insisted upon.

On examining tenement buildings, built even in recent years, it is quite evident that the architect and builder has kept specially in view the object of having an imposing elevation, something that would look well from the street, while the interior arrangements are in distinct opposition to the healthy occupation of the houses, and are a standing proof of thorough incapacity on the part of the architect or builder, or total indifference to the requirements of health. We are also at once struck with the darkness of the common stair, it being in the centre of the building, and, being surrounded with rooms, cannot be lit with side windows. As little space is utilised for the stair as possible, little or no "well" is left, with the result that the cupola on the roof only lights the upper flight of the stair, the tenants of the other three, or possibly more,

having to find their way as best they can into the houses. These dark entrances cannot but have a depressing effect on the health of the occupants. Staircases, if lighted by skylights, should have the skylights made of the lantern form, with sidelights to admit fresh air without admitting rain, and a large "well" so as to admit of the light penetrating to the lowest flight of stairs.

On entering the houses we are confronted with dark passages; closets and beds being shoved into dark and unventilated corners; bedrooms with only borrowed lights or small fixed skylights, and neither provided with a fireplace or other means of ventilation. Bedrooms such as these are often used for children, as they make such a turn up in a good bedroom; in these places there is nothing to displace, only the bedding and a chair or two. This saves a great deal of the work, but how about the quality of the bone and muscle developed by the portion of the rising generation penned in these boxes two-thirds of the time; they are gathering strength to fight this world's battle. Then, again, we have the basement houses with two-thirds of the height of the rooms underground, and where very little of the light of day enters. Houses which have their floor level under the level of the surface of the surrounding ground should not only not be used for sleeping rooms, but should not be used for human dwellings. There is always a deficiency of sunlight in them, and a tendency to dampness.

There are hundreds of houses in Glasgow where you cannot see to read at midday when standing in the centre of the floor, unless on a very clear day. Can it be wondered at that occupants of such houses are uncleanly? every facility is given them to be uncleanly. "Cleanliness is next to Godliness," but if light is not furnished little cleaning is done, therefore is it surprising that so much ungodliness exists in our large towns. The heart is taken out of the people, the houses are so depressing that in their evenings and leisure the tendency is only towards some exciting occupation or amusement, such as gambling, drinking, &c. The youth reared among our artisan classes in cities, such as Glasgow, cannot settle down to study and mental improvements, therefore the majority are soon outstripped by their cousins from the country, who, being stronger and healthier, have more push in them, and can shoulder their way to the front better in the crowd.

It is the influences and surroundings of the environment in which a youth is reared which moulds the man.

I entered a dwelling-house lately, and, noticing the blinds drawn, I asked why the "screens" were down. "To keep the people opposite from looking in while the gas is lit," was the reply. There are only a few feet between the walls of that tenement and the next. Could that house be healthy? The want of light is most detrimental to health; a dark house is always an unhealthy house, a badly aired house, and a dirty house.

The fashion also of hanging curtains over windows is objectionable. Everyone knows the amount of dust that collects on a curtain. It is unreasonable to provide large windows to light the room, if the greater portion of the light is shut out by hanging curtains over them. In this country direct sunshine is always necessary for maintaining purity of air.

CENTRALISATION OF HOUSES.

Again, the practice of crowding our houses together and the use of coal for our domestic hearths tends to increase the smoke cloud overhanging our cities, which prevents us from benefiting from the purifying influences of the sun's rays.

There is not the least doubt that the quantity of smoke present in the air of our large towns is prejudicial to health. This is the natural result of the centralisation of dwellings. Researches made by various scientific men have proved that exposure to the direct rays of the sun will kill the most fatal of disease germs. Professor Ward, in reporting on the results of his experiments as to the rate of growth of bacteria, under the

* A paper read before the Glasgow and West of Scotland Technical College Architectural Craftsman's Society.

influence of light of different colours, said:—"Cultures from which the blue rays were screened flourished well, and formed spores; whereas the others, which were fully exposed, were starved and retarded, and could scarcely form spores at all." He proved beyond doubt that the spores of anthrax (a most deadly disease) would succumb to sunlight. Dr. Edward Franklin, who investigated the development of the bacteria of the River Thames water, proved that they decreased in number $\frac{1}{4}$ times near the surface of the water, that is, where they received the almost direct rays of the sun, while 2ft. below the surface they increased one-fifth. It has also been proved, I think by Mr. Aitkin, of Falkirk, that the rainfall in towns is greater owing to the amount of smoke or soot particles in the air.

The harm done to us by smoke has been classified by Professor Ramsay under three heads:—

"1. It deposits in our houses, on our clothes, and on our persons, as 'blacks,' necessitating a great expenditure of labour and of soap.

"2. It condenses atmospheric vapour, causing fog and rain, and rendering our climate colder, and makes our lives more or less unhappy and uncomfortable.

"3. It shuts out sunlight, and thus increases the growth and tends towards the multiplication of bacteria—many of which are of a dangerous character; and inasmuch as it condenses vapour on its particles, it accumulates the atmosphere in the form of haze, mist, or fog, material, capable of absorbing precisely that quality of light which proves fatal to bacteria—namely, blue, violet, and ultra-violet light."

It is, therefore, quite evident from the evidence of the first authorities on chemistry in the kingdom, that the practice of using coal for our fires, whether in our dwelling houses or our factories, is the principal cause of the air of our towns being so impure and detrimental to our health, and that the evil is aggravated by the crowding of our dwellings on a too limited space.

Legislation is weak on this point, but if the purification of the atmosphere of our towns is to be the means of extending our lives, and of rendering life worth living, why should it not be done. There is no doubt that the smoke cloud above us can be cleared away; our water has been purified; our sewage is being purified, why should the air surrounding our dwellings not be purified.

AIR.

The common conditions of bodily health are influenced to a great extent by the atmosphere in which we live, and as our dwellings greatly affect this, we can hardly attribute too much importance to the nature of our houses. The health of any building is dependant upon free-moving pure air, outside and inside its walls. To ensure purity of air in our dwellings necessitates the consideration of various conditions which affect it—the site, the design, the construction, the building materials, the internal arrangements, and the cleanliness are the principle, although to go into detail others might be quoted.

SITE OF BUILDINGS.

The healthiness of a site depends not only on its position, and what lies around it, but on the soil itself.

It is well known that previous to buildings being erected, sand, gravel, clay and other substances that have a marketable value are frequently dug out of the proposed site and the excavations are filled in with any rubbish that is available. It is universally acknowledged that sites thus made up are to be regarded with suspicion, as very objectionable material is frequently buried out of sight in "free coups," and the houses erected over them are therefore more or less liable to the unwholesome exhalations arising therefrom.

These artificially made sites are, however, not the only ones which should be regarded with suspicion, as even gravelly soils necessitate some protection, as a vast amount of air is contained in pores or air spaces of a gravelly or sandy soil, and ground air is not the most invigorating air we prefer to enter our houses.

(To be continued.)

Surveying and Sanitary Notes.

COLONEL A. G. DURNFORD, R.E., has held an inquiry on behalf of the local Government Board at Taunton, into the application by the Town Council for powers to borrow £18,250 for purposes of sewage disposal.—The Town Clerk pointed out that £7000 of the money required was to be applied to the purchase of Landbrook Farm for irrigation purposes, and the remaining £11,250 would be applied for the carrying out of works for and adopting of the existing sewage works to the septic tank system in accordance with the scheme drawn up by Mr. A. J. Martin, of Exeter.—Mr. Kite gave an undertaking on behalf of the Town Council to either remove altogether or render immovable a certain movable sluice or hatch near the storm overflow at the works.—The usual formal evidence was given, and the inspector subsequently visited the works.

SOUTH WALES is becoming alarmed on the subject of the London County Council's scheme for appropriating the water on the Welsh hills for the use of London. There is no desire to play the part of the dog in the manger to the 6,000,000 of Londoners, but what about the teeming populations of Glamorganshire and Monmouthshire? The population of South Wales has increased enormously in recent decades. The population of the Rhondda Valley is already some 150,000, and it is in constant danger of a water famine. Some new scheme for supplying it with water is imperatively called for. The rapid working-out of the coal-field and the number of old workings thus left not only drains the district of a great quantity of water, but, from the danger of subsidences which it creates, makes it highly undesirable to have the reservoirs at all near the centres of population. Cardiff and Merthyr have already gone further afield, and having staked out for themselves valleys in Breconshire, away from the coal districts, are amply secured for a generation or two. Swansea, too, has appropriated a great portion of the watershed of the Usk. It may be that the areas scheduled by the London County Council will leave plenty of water for all the possible needs of Wales, but the occasion is felt to be one for vigilance.

SEVERAL important works have been practically completed at Liverpool, such as the new canal-graving dock, a large portion of the extension of the hydraulic power over the estate, and the improved arrangements at the dock-yard. The new half-tide dock and river entrances, besides the deepening and shed equipment of the Huskisson Dock, are very advanced. The widening and deepening of the east passage between the Alexandra and Langton Docks has recently been determined upon. The new tobacco warehouses at the Stanley Dock are making good progress, and in about two years it is hoped that that important trade would come into occupation of a storage installation superior to any accommodation available at other ports. The Mersey Docks and Harbour Board has decided to grant facilities for receiving barge-carried grain at the south end, and to encourage, where practicable, the system of moving goods from place to place by lighters. They are now increasing the space for sorting Irish cattle landed at the Prince's stage, so that 3000 beasts would be provided for, and are extending the shelter sheds at the landing stage further north, and making other alterations, so that the unprotected space which passengers had to cross would be reduced to a minimum.

THE much-talked-of bacterial treatment of sewage was the subject of an address by Dr. A. Bostock Hill to the Institution of Civil Engineers the other day, and members are now receiving an abstract of the line of argument adopted. Dr. Hill seeks to show that the old

views with reference to the chemical treatment of sewage were false both in theory and in practice. He strongly favours the disposal of sewage by the modern bacteriological methods, and affirms that any system opposed to the principle on which the resolution of sewage by the action of bacteria depends must fail. The failure of purification at the Sattley Sewage Farm, he explains by saying that the flooding of the land prevented access of air to the bacteria. Without air they died, and no purification of the sewage could take place.

THE Royal Commission on the question of the Metropolitan Water Supply reassembled on the 19th inst., Lord Llandaff being in the chair.—At the outset a Commissioner asked Mr. Pember, as representing four Water Companies, whether he would be prepared to let the Commissioners inspect the balance-sheets of these Companies in order that they might see how their finances stood.—Mr. Pember replied that he should be pleased to do so.—The various counsel representing the other Water Companies volunteered to let the Commissioners have similar information.—Mr. Hawksley, C.E., was then examined. Asked by the Chairman whether it was his opinion that the Thames alone would suffice to supply water in the future, he said he was perfectly satisfied that it would not be necessary to go elsewhere for the next hundred years. It would be an unnecessary precaution at the present time to appropriate a site in Wales for a future water supply. If the drought of 1898 occurred annually the accommodation provided by the Staines reservoir scheme would be adequate to meet the calls made on it. He had considered Sir A. Binnie's estimate of the cost of the Welsh scheme, and had come to the conclusion that it could not be carried out for the sum put down by that gentleman.—Lord Llandaff: Is it not your experience that the Corporations and public bodies that have required the water supplies of their districts have ultimately reduced the charge to the consumer?—Mr. Hawksley: Not until generally a considerable period has elapsed.—Lord Llandaff: But ultimately the increase of income goes to the benefit of the water consumer?—Mr. Hawksley: Yes, but in the meantime the water consumer or ratepayer has had to bear a considerable loss.—The Commission adjourned until January 9th.

A MASTER BUILDER, named Wray, was killed last week at New Brompton, Kent, by falling 30ft. from the chimney of a house which is being built.

At a meeting of the Scarborough Town Council it was stated, authoritatively, that the new marine drive and sea wall, which the Corporation are constructing round the Castle Hill at a cost of £80,000, would not be completed before the summer of 1900, a year beyond the time originally fixed.

THE original plan prepared by the famous engineer George Stephenson, and his son, for the first line of railway from Birmingham to the metropolis, is to be sold this week in London. This unique memorial of an important undertaking bears the autograph signature of Robert Stephenson.

At a special meeting of the Runcorn District Council, it was resolved to memorialise the Board of Trade for a provisional order under the Electric Lighting Acts to supply electrical power in the town, and instructions were given to deposit the usual fee of £50 for the purpose. It was stated that the action of certain electrical companies had impelled the Council to take this step.

ANOTHER "deep level" electric line is to be submitted for the approval of Parliament next Session. This scheme, which is under the auspices of the Great Northern Railway, though promoted by an independent undertaking, is intended to relieve the Great Northern metals of a large portion of the Company's increasing suburban traffic, and to provide much-needed transit facilities from the West Central districts to the Northern suburbs. At a future date the line will no doubt be continued under the Thames to Waterloo Station.

A SOUTH AFRICAN SANATORIUM.

THE Sanatorium at Kimberley, which has recently been opened, is the practical outcome of the "policy of ransom" propounded by Mr. Rhodes some years ago, whereby the Compound profits were to be devoted to objects tending to promote the welfare of the Diamond Fields and the inhabitants thereof. The cost of the Sanatorium has been almost entirely defrayed out of these Compound profits. It is now rather more than two years since Mr. Rhodes first broached the idea of a sanatorium in public. Some discussion arose as to where the sanatorium should be built, and in a letter to Mr. Lawrence as early as September, 1895, Mr. Rhodes said: "After considering the comparative merits of localities, I have come to the conclusion that Kimberley presents advantages for such an institution that are not possessed by any other place in South Africa. For while, as regards climate, it may be said to equal any other health resort, in respect to its surroundings it surpasses all others. It is an unquestionable fact that to patients suffering from affections of this nature, want of employment for the mind seriously prejudices the chance of recovery, and though in many towns and country places the climate and accommodation may be all that can be desired, improvement and cure cannot be effected, or are much delayed owing to this want. But in Kimberley this great disadvantage does not exist. It has been stated that the dust, for which it used to have an unenviable reputation made Kimberley an undesirable place for invalids; but I think you will bear me out when I say that since we have been working in the blue ground, and the present ample water supply was brought in, Kimberley is in this respect no worse off than any other town on the high plateau. I have, therefore, as above stated, arrived at the conclusion, that Kimberley, from all points of view, is the most suitable locality for a sanatorium." Through the offices of Mr. Currey a suitable site of nine acres was obtained from the London and South African Exploration Company free of charge, and Mr. Rhodes was

approached with a view to getting him to increase the building fund. At this time it was anticipated that the building would cost about £8000, or, with furniture, etc., £10,000. Messrs. Wernher, Beit, and Co. came forward with a donation of £2000, and plans were called for (£100 being offered for the best design, which was won by Mr. D. W. Greatbatch), and as soon as possible a commencement was made with the building. Owing to the difficulty of keeping in touch with Mr. Rhodes, and as the Board felt it necessary to have ample funds at its disposal for the carrying out of the scheme, the De Beers Company was communicated with in order to ascertain if it would guarantee the Board a sum of money which would bring the building fund up to £20,000, which the Company agreed to do. From time to time Mr. Rhodes has been approached for funds since then, and up to the present time a sum of

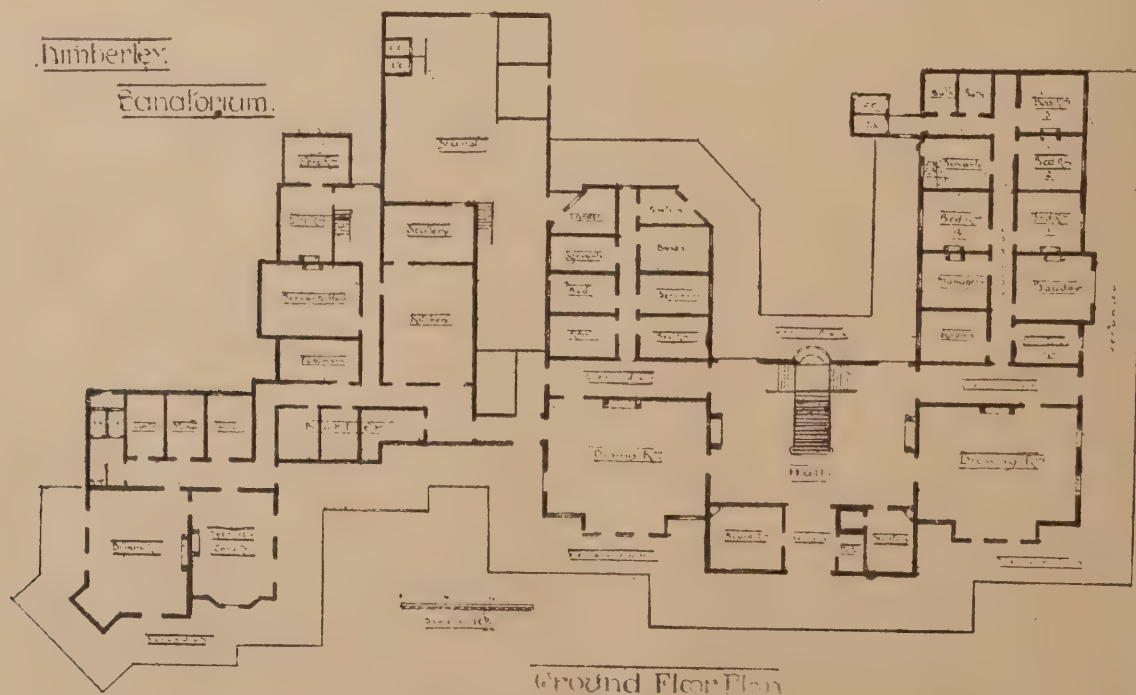

SOMETHING LIKE £26,000

has been, or is being, spent in connection with the building and furnishing of the institution. The Board expects that this amount will be sufficient to meet all requirements, and that the institution, given a fair start, will pay its way. Any profits accruing will probably be spent in extensions or improvements. The building stands in its own grounds, these being nearly nine acres in extent, the front facing towards Beaconsfield. Externally the building has no special features, being plainly but substantially built of burnt brick, and the comfort and convenience of the inmates has been the object in view rather than architectural adornment. A carriage drive from Egerton Road runs right round the building, coming out again near the Halfway House. The gardens have been laid out and planted with pepper and other trees, trenches having had to be cut through the solid rock. The main entrance opens on to a vestibule 14ft. by 12ft., on the right of which is a porter's lobby, while to the left is the Board-room. Passing through a pair of swing glass doors set in a glass screen, one enters the hall, which may be said to be the feature of the building. Its dimensions are 45ft. by 30ft., while it extends to the height of the two floors. This is almost the only portion of the building where there has been any

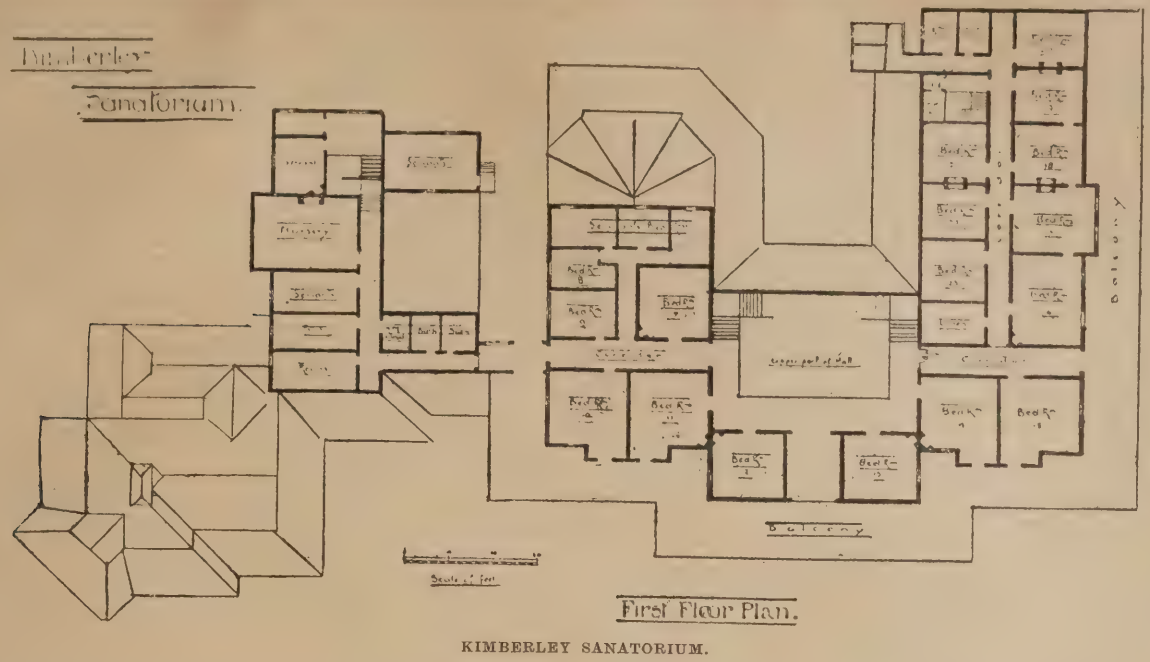

ATTEMPT AT DECORATION,

The hall is panelled out in grand oak, and there are two fireplaces, one at each end. The grand staircase, starting at the centre of the hall, is 8ft. in width, and has a very gentle rise. To the right of the hall is the drawing-room, 35ft. by 25ft., the chief

feature of which is a handsome teak mantelpiece. The dining-room is on the opposite side of the hall, a room of the same size and shape as the drawing-room. To the back of the hall are two 8ft. corridors, leading to the bedroom blocks. On the ground floor are half a dozen bedrooms, and the private rooms of the manageress, a servants' staircase, two bathrooms, and lavatory accommodation. There is also in this block a ladies' boudoir, 17ft. by 15ft. At the rear of the dining-room, and approached by a similar corridor, is a block of buildings, containing, on the ground floor, five servants' bedrooms for the use of servants of visitors, a box-room, larder and book-room. The kitchen block is a detached building, access being gained to the dining-room by a covered way, with windows on either side, so that there is but small chance of any smell arising from the ordinary operations penetrating to the dining and other rooms. Going through the covered way, the first room is the servery, with an opening into the kitchen, and a door to the butler's pantry. Near the latter are two rooms for the use of the butler, and a room for the footman. The kitchen is 26ft. by 20ft., with a large kitchen range (over the fixing of which there has been a lot of trouble, by-the-way) standing in the centre. Adjoining the kitchen is the scullery, 20ft. by 12ft. Crossing the passage from the kitchen, one comes to the servants' hall, 22ft. by 16ft., next to which is the stillroom. Close by is the tradesmen's entrance, and in this block is also a servants' staircase. To the left of the kitchen block, and slightly in advance of it, is a block of buildings, comprising a billiard room, 28ft. by 22ft., a smoking room, 23ft. by 18ft., lavatory accommodation for gentlemen, and wine store. This block can either be approached from the main building through the kitchen block, or, as will most frequently be the case, by means of the verandah. The block, which is intended for the use of gentlemen only, is entirely self-contained. On the first floor are nineteen bedrooms, several of which are of large size, 20ft. by 18ft., also four bathrooms (fitted with hot and cold water taps), and the necessary lavatory accommodation. Over the kitchen block are the servants' bedrooms, and a children's nursery, 22ft. by 16ft. Nearly every bedroom is fitted with a fireplace, and hot water is laid on throughout. The whole of the building, with the exception of the kitchen block, is provided on the ground floor with a verandah 12ft. wide, while on two faces, those facing Beaconsfield and the Free State, is a balcony of similar width, a portion of which is always protected from both sun and wind,

KIMBERLEY SANATORIUM.

and in the event of boisterous weather ample exercise can be obtained by this means, the balcony affording

A CAPITAL PROMENADE,

combined with the finest view to be obtained on the Diamond Fields. Ventilation has been carefully considered, and on the first floor the rooms all have double ceilings, by which means coolness will be greatly promoted. The whole of the building has been fitted with the electric light and electric bells, the work being entrusted to Messrs. Findlay and Co., of Cape Town. The necessary cables have been laid by the De Beers Company's employes from the generating station, under the supervision of Mr. G. Labram, the Company's chief engineer. Messrs. Church and McLaughlin are the contractors, the work having been carried out from plans by Mr. D. W. Greatbatch, M.S.A. It is impossible at present to give an exact estimate of the cost of the building, but this will probably amount to about £18,000. The furniture all comes from England, and is of a thoroughly substantial and useful order.

CROSSES have just been added to the new church at Bishophorpe, near York.

A New Theatre at Shrewsbury.

THE New Theatre Royal was opened last Monday week at Shrewsbury, the whole of the interior having been absolutely reconstructed, whilst the outside walls have been altered and added to. The theatre has been constructed from the designs of Mr. John P. Briggs, of Arundel Street, London. It is fitted up with all the latest improvements. The architect has been most successful with the sight lines, and every occupant of a seat obtains a clear and uninterrupted view of the stage. The building is constructed on the most scientific principles, and the two tiers above the pit are supported by massive cantilevers, so that there is neither pillar nor post to obstruct the view. The stage is large enough to accommodate the heaviest productions, and is fitted with the most approved appliances for scenic effects. The whole building is supplied with the electric light, and the front elevation is very effective. The exits from all parts are exceptionally good, being so arranged that the auditorium can be cleared in the space of a very few minutes. All doors are made to open outwards,

and are fitted with patent automatic panic bolts, no other locks or fastenings being necessary. The theatre is heated throughout by hot water on the low pressure system, with American radiators. Special attention has been given to the ventilation of all parts of the house, which has been carried out on the Honeyman system. The decorations of the building have been carried out in the French Renaissance style. The whole of the work has been done under the personal superintendence of the architect. The following are the names of the principal firms engaged in the construction and fitting up of the building:—Builder, Mr. Thomas Morris, Shrewsbury; steel constructional work, Messrs. Deane, Ransome, and Co., London; fibrous plaster and artistic decorations, Messrs. F. de Jong, London; hot water heating, Messrs. Scull Bros., Shrewsbury; electric light, Messrs. Lea, Son, and Co., Shrewsbury; gas arrangement and fireproof curtain, Messrs. Vaughan and Brown, Limited, London; ornamental stained glass, Messrs. A. Clark and Co., London; mosaic floors, Rust's Vitreous Mosaic Company, London; tiling to pit, Porcelain Tile Company, Cobridge; ventilation, Messrs. Crittall and Co., London; sanitary appliances, Messrs. Macfarlane and Co., Glasgow, and the Water Carriage Company, Sheffield.

SURREY.—Choice BUILDING ESTATE.

—In a charming district, two miles from Horley
station (L.B. and S.C. Rly.) under one hour from
London and adjoining a village where are church, shops,
and post-office; two miles from Roman Catholic Church.
FOR SALE, a compact and valuable FREEHOLD
PROPERTY of 53 acres, with a frontage to the main
Brighton road of 2000ft., and perfectly ripe for develop-
ment, with residences of a good class. Prettily timbered.
Gas and water mains along the frontage. Would be
divided.

Plans and full particulars of the owner's agents,
Messrs. GREEN and SIMES, Auctioneers and Estate
Agents, Blenheim Mansions, Queen Anne's-gate,
London, S.W.; or Mr. W. M. LEACH, Auctioneer and
Estate Agent, Crawley, Sussex.

FAIRMILE PARK, near Cobham, Surrey.—A FREE-
HOLD BUILDING ESTATE of about 40 acres, with
possession.

MESSRS. DRIVER and CO. have received
instructions to offer to AUCTION at the MART,
Tokenhouse-yard, Lothbury, NEXT SPRING (unless
previously sold by private contract), the above property,
situate in a favourite residential district, about a
quarter of an hour's walk from the Oxshott and Fair-
mile Station, and about a mile and a half from Cobham
Station. The estate comprises Building Land, ripe for
development, the higher portion (sloping to the south)
possessing charming views over the intervening country
to Epsom Downs; and a Residence known as "South
Godge," with stabling and garden; Eight small Villas,
some Cottages, and the "Griffin" Beerhouse. On a
portion of the estate brickearth is being worked, and
will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of
CHARLES JUPP, Esq., Solicitor, 48, Lime-street, E.C.;
and of Messrs. DRIVER and Co., 23, Pall Mall, S.W.

By order of Trustees.—Preliminary Advertisement.—
Freehold Building Estate, Streatham, near West
Norwood Railway Station.

WALFORD and WILSHIN, who are jointly
concerned, will SELL by AUCTION, at the MART, at
an early date, a valuable FREEHOLD BUILDING
ESTATE, known as High View Park, comprising 16a.
r. 10p., lying immediately at the rear of and with
approach from Leigham Court-road; also a contiguous
Freehold Building Site of 2a. and 5p. in a new road
intended to connect Canterbury-grove with Thurlby-
road.

Particulars and plan, in due course, of Messrs. KINGS-
ORD, DORMAN, and Co., Solicitors, 23, Essex-street,
trading; of Messrs. WALFORD and WILSHIN, Auc-
tioneers, Ankerly, S.E.; and of Messrs. FIELD and SONS,
s above.

By order of the Executors of Miss Susanna Roycroft.—
Camberwell.—Leasehold Ground Rents.

MESSRS. FIELD and SONS will SELL by
AUCTION, at the MART, on WEDNESDAY,
JANUARY 18th, at TWO o'clock, in two lots, improved
LEASEHOLD GROUND RENTS, amounting to £45
per annum, arising from and amply secured upon three
lots and six dwelling-houses, being Nos. 202, 204, and
206, Camberwell-road, and Nos. 34, 36, 38, 40, 42, and 44,
Aldison-street, adjacent, of the rack rental value of
about £200 per annum.

Particulars of G. ASTELL HALL, Esq., Solicitor, 8,
ray's Inn-square, and of the AUCTIONEERS, 54, Borough
High-street, S.E., and 52, Chancery-lane, W.C.

Old Kent-road.—Leasehold Investment.

MESSRS. FIELD and SONS will SELL by
AUCTION, at the MART, on WEDNESDAY,
JAN. 18, at TWO, three modern LEASEHOLD RESI-
DENCES, Nos. 93, 95, and 96, Avondale-square, in good
situation, close to Old Kent-road Station, let
estimated to produce from quarterly tenants about
12 per annum, and held for about 60 years unexpired
ground rents.
Particulars of FREDK. W. FIELD, Esq., Solicitor, 52,
Chancery-lane, W.C., and of the AUCTIONEERS, as
above.

ASSOCIATION OF DESIGNERS.

DESIGNS, WORKING DRAWINGS, PERSPECTIVES,

Coach," 31, Herbert-road, Plumstead, S.E.

R. I. B. A. SOCIETY OF ARCHITECTS, and
CIVIL SERVICE TECHNICAL EXAMINA-
TIONS. Preparation by correspondence, in residence,
or personally.—MIDDLETON and CARDEN, 19, Craven-
street, Strand, W.C.

PLANS, SPECIFICATIONS, QUANTI-
TIES, &c., carefully prepared by young Architect.
Moderate terms to those about to build.—ARTISTIC, 1,
West-terrace, Whitby. 1

APPOINTMENTS VACANT.

The charge for Advertisements under this heading
is 1s. 6d. per insertion not exceeding four lines, and
6d. per line afterwards, prepaid. Three insertions
may be had for the price of two.

WANTED a capable ASSISTANT. Must
be a good draughtsman, with architectural
experience. Send samples of drawing.—State age,
experience, and salary expected, and references to JAMES
PERRY, M.E., M.L.C.E., County Surveyor, Galway. 2

WANTED, a thoroughly qualified ARCHI-
TECT'S ASSISTANT. Must be able to help
with quantities. Salary not exceeding £3 3s.—Reply,
stating experience, forwarding specimens of work, to
ARCHITECT, 102, Westborough, Scarborough. 1

TRACING and TYPE-WRITING.—
VACANCIES for pupils in well-established Office,
Gentlemen only.—Box 853, BUILDERS' JOURNAL
Office. 1

NORTHAMPTON INSTITUTE, Clerken-
well, E.C.—APPLICATIONS are invited for the
post of CARPENTER and INSTRUCTOR in CAR-
PENTRY and JOINERY. Salary £120 per annum; full
time. Applications should be received not later than
January 3rd, 1899.—For further particulars apply, by
letter, to R. MULLINEUX WALMSLEY, D.Sc., Principal. 2

MANCHESTER CORPORATION TRAM-
WAYS DEPARTMENT.

The TRAMWAYS COMMITTEE of the Manchester
Corporation require a competent ENGINEER to assist
the City Surveyor in carrying out the engineering
work required in connection with the permanent way;
he must have a thorough knowledge of tramway con-
struction and be capable of preparing plans for and
superintending the construction of all new lines, and the
alteration and reconstruction of the existing track
necessary in view of the introduction of electric traction.
Salary £200 per annum.

The Committee also require a TEMPORARY
ENGINEERING ASSISTANT; he must be a neat and
expedient draughtsman and able to survey and level
accurately. Wages 50s. per week.

Applications, stating age, qualifications, and enclosing
copies of recent testimonials, to be addressed to the
Chairman of the Tramways Committee, Town Hall,
Manchester, endorsed "Engineer" or "Engineering
Assistant," and must be received on or before SATUR-
DAY, the 31st December, 1898.

WM. HENRY TALBOT,
Town Hall, Manchester, Town Clerk.
16th December, 1898.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading
is 1s. 6d. per insertion not exceeding four lines, and
6d. per line afterwards, prepaid. Three insertions
may be had for the price of two.

An Architectural Causerie.

An Artistic Atmosphere.

WAS it not Schumann who, in his advice to young musicians, forbids them to

play bad music or even to listen to it? This by way of preserving intact what an esteemed contemporary once called—in a moment of inspiration—"the higher taste and fancy." This advice may be all very well for the musician, he may find it possible to carry it out. Nobody asks him to produce bad music, and nobody, but the organ grinder, asks him to listen to it. The door is always open to him to leave the room, or, as a last resource, he may stop his ears. As for his productions, good or bad, the world *could* roll on without them. The penny steamboats would still ply on the Thames—at intervals—and Parliament would meet again as usual. There is no more excuse for the musician than there is for the poet to produce aught but the best. But with the architect it is different. The world must have buildings, and so he must produce something—good if possible, but still he must produce. Parliament could not meet without a Parliament House. There is therefore some excuse for him if he produces the bad, or, at any rate, the mediocre. The spirit of genius cannot be for ever whispering in his ear. Haply she is truant at times—to inspire the courtly lays of the Poet Laureate, or the *obiter dicta* of metropolitan magistrates. But daily the mill grinds on; warehouses will not wait; ground rents are being paid, and the speculator hungers for his profits. The citizens increase, and they must be housed; old buildings decay, and they must be renewed—whether the architect be inspired or not. The streets of London bear witness that generally he is not. For if we thus turn out, day by day, our allotted tale of bricks and mortar, driven by the whip of the taskmaster, with one longing eye on the Promised Land—the echoing slopes of Parnassus, the flower enamelled meadows where Apollo sings—and the other gloomily fixed on the date for signing the contract, what chance have we? and what profit have our comrades? We force them to go about the streets in blinkers, or tap the pavement with a stick, in the interests of "the higher taste and fancy." The artistic temperament is sensitive and impossible; perhaps we never realise the precise effect the sordid appearance of our streets must have on anyone cursed with such a system of construction, or how far the mediocrity of the fathers is visited on the children. A certain groove fallen into; a certain atmosphere created; into this we all are born, and in this we live and breathe and work. There is little doubt that the lack of a clear and bracing artistic atmosphere will account, in a great measure, for much that is commonplace. The mental atmosphere in which London architects live is as depressing as the natural atmosphere, and has the same insidious effect, in a general lowering of tone. Is it not Ruskin who says that there is that in the streets of a town that "bricks up to death men's imagination, as

sure as ever perished forsworn nun." Hand and eye, heart and brain alike, grow inured to the commonplace; and how to avoid it is the puzzle. We cannot shut our eyes whenever we see a bad building, or when should we get a chance to open them? and some of us cannot even refrain from producing bad buildings ourselves, however much against our will. The world will have buildings; good or bad, it will have them, and it always wants them at once. A. R. J.

importance and interest of their subject, and to have concerned themselves more with a record and description of buildings than with the spirit which gave them birth. What seems to be still needed, is a broad and comprehensive review of the march of human progress in this direction. A treatise that should deal, not so much with the details of actual buildings, as with the physical and spiritual wants that called these buildings forth, and the skill that rendered them pos-

European Architecture.*

It is no disparagement to the labours of many distinguished men to say that the ideal history of Architecture has yet to be written. It is a truism to remark that the history of Architecture is the most certain record of the progress of humanity. They, therefore, who would attempt this record, engage in an undertaking to which is attached a peculiar dignity and responsibility. They write the history of the growth of the human spirit, as traced in its noblest manifestations. With the exception of Viollet-le-Duc, most historical writers seem hardly to have realised the full

sible; that should demonstrate how the same reasoning power, whether applied at the Acropolis of Athens or the Isle of France, tends to produce its effect according to the materials upon which it acts, and so, in different circumstances, produces different results. Of this latest history before us, it cannot be said that it throws any new light on the working of the human mind. If it has any special feature, any unusual justification for its existence, it is that it is written by an American, partly with the idea of providing for those American students who cannot visit Europe, a help in the interpretation of their photographs and plans. To write a history of Architecture two things are indispensable,—an exact knowledge of facts, and a complete understanding—a firm grasp—of the nature of Architecture and its fundamental principles. On this last point, many of us would be inclined to join issue

* "European Architecture: A Historical Study." By Russell Sturgis, A.M., Ph.D., F.A.I.A. Macmillan and Co. Ltd.

with the author from the very first definition of Architecture in his introduction, where he states that "Architecture is what is known as a decorative art, that is, it consists in applying fine art to certain objects of utility—in this case to buildings." Would it not be more precise, to say that Architecture is a *constructive art*—the art of building? Again, the author sometimes appears to lose his grip of first principles, as for instance, when discussing Palladian work, he observes: "The fronts of churches such as S. Francesco della Vigna are criticised in the very guide books, as not agreeing with the interior; but this, after all, is a small fault, as the chief lighting of the interior is easily provided, and the building is a simple hall which any front may be thought to suit; it is a common fault, too, and all Italy joined with Palladio in building its church fronts as it pleased." But is this after all a small fault? and will any front suit a simple hall? and because the fault is common, is not this the greater reason it should be condemned? It seems to us that, if a history such as this is to be of any real value to students—beyond providing them with a pleasantly-written catalogue of names, dates, and details—it must keep a firm hold of principles, and discriminate between those buildings which embody them and those which do not; between those which are the work of skilful and accomplished architects, handing down principles and traditions, and those which are contemporary imitations and adaptations by comparatively ignorant men. For, in all ages, architects have been few and builders many. And for the illustrations of such a history, should they not be selected as typical examples of the various styles, rather than as isolated and abnormal instances? for the abnormal may interest, but the normal teaches. And should they not, where possible, be complete monuments, or sufficiently complete for us to tell what the original idea was, what the designer thought and felt, how he looked at things? for this is what we want to know. On page 221 is a reproduction from Viollet-le-Duc—a study of what a church of the character of Reims Cathedral would have been had it been completed according to the original conception. Does not this show us, at a glance, more of the men of that day, and their ideas and aspirations, than drawings of a dozen mutilated or unfinished examples, which are often a puzzle to the keenest minds? And while the author was by way of borrowing from Viollet-le-Duc, how many wonderful drawings might he not have found in the "Lectures," or "The Habitations of Man," such as the typical Venetian palace in the latter. As it is, the illustrations, both with regard to their selection and to their merits as drawings, leave much to be desired. There certainly are nine photographs, which, for beauty of subject, or of reproduction, could not easily be surpassed, and the drawings from Viollet-le-Duc would lend distinction to any book; but what can be said for the drawings of S. Sebaldus at Nuremberg, or S. Katherine at Oppenheim, from Foerster? or of many others which seem to have been prepared for this volume? Considering how many first-rate black-and-white draughtsmen America can boast of, it seems strange that these drawings should be so poor.

THE French Minister of Public Instruction has just presented to the trustees of the British Museum a cast of a bronze statue of a young charioteer, the original of which was recently unearthed by French archaeologists on the site of Delphi. The owner of the chariot can be identified by an inscription of two verses which has survived along with the statue, as Hieron, King of Syracuse, a frequent competitor at the Pythian and Olympic games, and the patron of Pindar and Bacchylides.

ON REFLECTION.

When Doctors Disagree.

ACCORDING to a late telegram, Dr. Baccelli, Minister of Public Instruction, has ordered the immediate evacuation of the three halls in the Doge's Palace, which, if the apprehended collapse of the structure should occur, would be the first portion of the building to suffer. The whole library of St. Mark's will then be removed into the rooms of the Zecca. This seems to show that the reported sinking of the structure adjacent to the Bridge of Sighs, and the yielding of the timbers supporting the floor of the library of St. Mark, is of a serious nature; although the architects of the Palace, and Signor Berchet, and Signor Rosso, respectively the director and architect of the district committee, state that the apprehensions entertained on the subject are of an unduly exaggerated character, that the alleged subsidence in the walls of the palace near the Bridge of Sighs does not exist, and that a slight movement of the wall is due only to the oxidation of the metal clamps and threatens no immediate danger. These gentlemen also deny that the floor of the library is in a dangerous condition; the decayed portions, they say, are being gradually renewed, and no stringent measures are necessary. Other distinguished Venetian architects, however, agree with the Report of the Council of Fine Arts, which first advertised the condition of the building, and the fact that it was necessary to shore up the floor of library three years ago, that parts of the ceiling of the Sala del Maggior Consiglio has fallen, and the settlement of the wall near the canal has broken the capitals of the pillars, would indicate that the building is in a bad state of decay. The action of the Minister of Public Instruction is no doubt authorised by the report of Signor Boito, the Milan architect who was appointed by the Government to report on the state of the building.

"The Church-going Bell."

WE are glad to notice that owing no doubt to the prolonged twilight of the 1898 silly season, incidental to the long Parliamentary vacation, the nuisance of London church bells has been exploited along with such old favourites as London Smoke, the District Railway, and Street Noises. We think that the poet who discredited the charms of solitude and bemoaned the immunity of the lonely valley and hill-side from the sound of "the church-going bell," can never have lived, laboured, or spent his Sundays in one of our cities or large provincial towns. Apart from the sentiments of tradition, there is a useful purpose served by the bells hung in the towers of our country churches; but the sentiment of a church bell pales very considerably when brought into close association with omnibuses and electric light and the clashing of those of numerous diverse sects and creeds. Besides this, the continuous clangour throughout Sundays and holy days is a great nuisance and distress to a large section of the community, more especially since the majority of these bells are cheap makeshifts which lack those essential qualities of timbre and calibre which gives dignity and a certain beauty to church bells. Modern bells are often, like many other modern things, but the crudest counterfeits and shams of what they assume to be. Often they are not bells at all, but steel tubes or rods, and when the form of the true bell is retained, they are commonly made of base metal, and are struck with a hammer because the building in which they hang will not allow of them being swung. When this arrangement is adopted the bells are rung by a mechanical contrivance that insures a rigorous accuracy in the stroke and rhythm—

and thus we are inflicted with bells from which every graceful and beautiful attribute has been stripped. Unfortunately it is not only in the smaller and less conspicuous churches that these sorry makeshifts are existent. Holy Trinity, Chelsea, is one of those churches which has been fitted with steel tubes struck with hammers, administered it would seem by clockwork. The din can be justly described by no other term than "infernal," and must certainly prejudice the value of the house property lying at that end of Sloane Street. Sorry makeshifts such as these, which exist not on their own merits but only because they assume to be something which we have learned to respect, are ill-fitted for any dignified use; and when connected with a place of worship, speak ill for the public ideals.

A Neurotic Age.

COMPLAINTS have been urged in particular, however, not so much against the "Church-going Bell" as that which may by a similar license be described as the Lunatic Asylum-going Bell. This bell has a weakness for playing tunes at unreasonable times, and is in particular addicted to telling the parish at length every three hours that "there's nae luck about the hoose." It then wakes folk up at three and six o'clock in the morning with four separate "cat-calls," and stammers out again that "there's nae luck about the hoose," a fact which, in the circumstances, it is a fatuity to insist upon. The Church of St. Clement Danes first drew forth the anathemas of lawyers living in the Inns, and now St. James' in Bermondsey is calling forth wide abuse. This church is distinguished with a "Diamond Jubilee set of chimes," and is so puffed out and flustered with self-consequence that it has fallen to the expedient of playing two tunes at once. This fact is guaranteed. At three o'clock in the morning "God save the Queen" and the "Old Hundredth" can be heard to fight it out, note by note, in the church tower. Contests between other rival tunes have also been noted. This public intolerance is characteristic of the present order of existence. The stress and strain of modern life will not brook distractions which were held to decorate and brighten the days of our grandfathers.

Improvements in Dublin.

LORD IVEAGH'S munificent gift of a quarter of a million towards the endowment of scientific research at the Jenner Institute, recalls his gift to Dublin of workmen's dwellings, recreation buildings and park, the scheme for which has just reached the stage of being set out in a Parliamentary Bill. The district involved in this handsome scheme of improvements is that lying about St. Patrick's Cathedral. The locality has long had an infamous reputation—even in Dublin—for its filth, ramshackle tenements, and abominable sanitation. The cathedral and the deanery, with its high enclosing wall, have been hitherto approachable only through foul and filthy by-streets, and are beset close on two sides by loathly slums. Perhaps in no city out of Ireland would this state of things be allowed to exist with the complacent satisfaction of the inhabitants; and even now we see that it is by private enterprise and munificence, and by no act of the Municipal Corporation, that the cleansing of this portion of the city is to be entered upon. Some time ago the authorities were compelled to demolish many of the old houses in this district, some of which fell, and there has long existed an unsightly tract surrounded by a high hoarding. Part of the ground to be presented to the city will be laid out in gardens; and the rest will be allocated to the widening of the streets abutting on the site, and to the erection of the buildings above mentioned.

Bridge over the Ebro
Zaragoza

DRAWN BY F. HAMILTON JACKSON.

SPAIN:

Its Picturesque Cities and Monasteries.

VI.—ZARAGOZA.

By F. HAMILTON JACKSON, R.B.A.

(Continued from page 197.)

ZARAGOZA may be easily reached by rail from Madrid, or from Barcelona, either by way of Lérida or Caspé. The lines run through scenery of the finest kind whichever route may be selected, though the Lérida line is the least interesting in spite of its passing close to Montserrat, owing to the large extent of barren country through which it runs. Near Zaragoza the country is rather flat, and for some distance outside Madrid it is featureless, but after passing Alcalá de Henares, the railway runs up the Henares valley and the landscape begins to be attractive. The name, Alcalá de Henares, means the Castle of the River—the Arabic “El Nahr,” meaning “river”—and from the railway the town presents an appearance of some importance, being girdled with towered walls, above which rise conical roofs and church towers. Formerly, there was a great and celebrated university here, now removed to Madrid. The place is also notable as having been the birth-place of Cervantes. The valley goes on gradually rising and narrowing, and the railway follows the course of the river, in the main, past the cities of Guadalajara (the river of stones, “Wada-l-ha-Jarah,” a most descriptive name), and Sigüenza (which presents an imposing appearance with its cathedral façade, and at the top of the town, the archbishop’s palace or alcazar), and many smaller places picturesquely situated and built, of which the curves of the line give travellers varying successive views. At the head of the valley the summit of the mountain range is pierced by a rather long tunnel, and then the line runs down the gorge of the river Jalon, crossing the frontier of Castile and Aragon between Huerta and Ariza. In this gorge, one looks

down on road and torrent passing together under the shade of abrupt precipices, which are hidden with greenery at their base, or through a rift into another tributary valley, the slopes of which sweep up to the sky, except for the crowning precipice—coloured of every warm earthy tint, contrasted with vivid green near the water. It is almost extravaganza-like, towns stand on isolated peaks of rock, round about which the line winds, giving many different views of the same place, while at the bottom of the valley the river rushes or lingers in pools, and the vineyards and orchards are only less green than the grassy meadows and cornfields. Above all stand mountain masses of fantastic shapes, often plunging down to the valley by precipitous descents, or rising to peaks which seem almost as if cut by the sweep of a sword, such as those blades of “ice-brook temper,” which used to be made at Calatayud, and plunged when hissing-hot in the icy waters of this river.

At Bubierca the scenery is particularly striking, the line tunnelling through small spurs of the mountain and passing beneath houses and churches with porches of Italian character, giving sudden glimpses of landscape, and odd views of village streets and mountain sides on issuing from the darkness of the tunnels.

If Zaragoza be approached towards sunset, the traveller may have the luck to see the sun throw a marvellous glow across the wide champaign to the distant mountains. The houses then flash out like jewels from the richly coloured plain, clouds and landscape mingling in one revel of colour of truly tropical splendour.

If the traveller start from Barcelona and travel by way of Caspé, at first the line runs through the rich lowlands near the sea, but after passing Reus begins to rise rapidly to pierce the mountain range which turns the Ebro southward from Mora. The scenery is very fine, the shapes of the hill crests magnificent, and the varying views of them up different valleys given by the curving of the line make the journey interesting. Just before entering the mountain gorges a fine panoramic view of the seaboard, bounded by the blue Mediterranean, is to be noticed, and at Mora del Ebro an equally fine mountain panorama, the hills forming, as it were, an enormous amphi-

theatre around the station. After arriving at this place the line runs up the valley of the Ebro for a considerable distance, not far from the bank, but high enough above the water to give extended views both up and down the river, and the train sweeps round curve after curve of the hillside, giving constantly changing views of river, of scattered villages, and of the country rising to the hills on the further side, tilled and fertile. One may see from the carriage windows pomegranates, figs, vines, carob trees, olives, walnuts, and many sorts of beautiful flowering plants, beside grain crops of different kinds, and quaint water wheels and other contrivances for irrigation. After the line leaves the Ebro Valley it runs through a barren land for a time, where the names of many of the stations are Moorish, such as La Zaida, but it returns towards the river some time before the towers of Zaragoza are seen in the distance.

Zaragoza is the capital of Aragon, and is a city of the greatest antiquity, dating from Celtiberian times. In the year 25 B.C. Augustus became its benefactor, and it was called *Cæsarea Augusta* in honour of him, a title of which the present name is a corruption. It was captured by the Moors in the eighth century, and was recovered from them in 1118 by Alonso El Batallador, after a siege of five years. It has two cathedrals, in each of which the Chapter resides alternately for six months; a curious arrangement, and one quite unique. The older of the two is called La Seo, “the seat” (the same idea as that expressed by “cathedral”), and it was used as a mosque during the Moorish occupation. On the outside are still some remains of decoration in the Moorish manner, arcading and interlacing patterns made of projecting bricks, with tiles and other pieces of decorative pottery inserted. The interior is a large oblong space with vaulted roof, supported by pillars at intervals, but not proportioned at all in the way our English cathedrals are. The high altar is in a little recess, and has above it a fine sculptured *retablo*, with rich Gothic canopies crowning the figure subjects, the whole surrounded by a rectangular frame, very richly and delicately carved. It was made in 1456. In front of it is the Gothic *Cimborio*, or lantern, which is octagonal. This was finished in 1520. The heart of Don Baltazar, the infante so often painted by Velasquez

NORTH DOOR, SAN PABLO, ZARAGOZA.

is deposited here; he died of smallpox in 1616. Ferdinand the Catholic was baptised in this cathedral. The *trascoro*, the back of the choir, is a fine work of Tudelilla in the plateresque style—it was executed in 1538. Around the choir runs a wide aisle, from which many chapels open, most of them shut in by *rejas*, or screens of good design, made of iron and a good deal gilded. At the right of the principal entrance is a largish chapel, which is used as a parish church. It has an *artesonado* ceiling, as those Moorish ceilings are called which are made in sunk geometric patterns coloured in blue, red, and gold. There is a fine fifteenth century organ, and the fittings of the choir are also of that period; in fact, there is very little work of an earlier date visible.

The other cathedral, Santa Maria del Pilar, is so called because it contains the jasper pillar on which the Virgin is said to have appeared to St. James in the year 40 A.D. He was bidden to raise a chapel on the spot, which he did, and the Virgin has since then frequently attended mass there—so the authorized legend says! It is a building of fine proportions, and seen from across the magnificent bridge over the Ebro (a work of 1437) the domes group splendidly. They are covered with glazed tiles, yellow, green, and white, which add a touch of colour and contrast to the bare walls. These walls, however, form an excellent background to the flower beds which are laid out in the plaza on the other side of the building, and in spring the aspect of that side is very pleasant, the bright colours of the flowers, and the children playing about between the beds in the sunshine giving accent and life to the scene, above which the sober, almost unornamented walls rise grey in the shadow. The church was a good deal modernised in 1753—

a great part being rebuilt, and the interior is cold and uninteresting. The *retablo* of the altar major is the masterpiece of Damian Forment, the Aragonese sculptor, and is a very fine piece of work, the figure subjects (which are taken from the history of the Virgin) being well grouped, while the whole composition is surrounded by a very rich border of scroll work and figures of the same shape as that at La Seo. The stalls in the choir are also earlier than the building, and there is a good organ in a fine case.

The "pillar" is housed within an oval chapel in the centre of the cathedral, behind the high altar, which is open on three sides and has a roof perforated with large oval openings, which is a fine piece of masonry. It is entirely constructed of precious marbles, and the *retablo* is much overcharged with statues and carving. At the right of the altar stands a figure of the Virgin dressed in most elaborate robes, upon the sacred pillar, to touch which, however, one has to go round behind, where there is a hole in the casing to enable the faithful to kiss it. The kisses of ages have worn a large dent, for the worshippers are fervent and are not contented with a single osculation. All around the shrine are hung votive tablets, models of eyes, noses, legs, &c., made of wax or silver.

The Church of Santiago, which has a fine Moorish-looking tower, contains a chapel said to mark the site where the apostle lodged when on his tour in Zaragoza. It also possesses his pilgrim staff, and a Gothic bell, which is of less doubtful authenticity. The Church of San Pablo, beyond the Mercado, is a very fine and impressive structure. It consists of a nave with aisles entirely surrounding it, and is lighted only by small windows high

up in the walls, so that the interior is very gloomy, and the figures of worshippers appear and disappear like shadows crossing the few places where the light is stronger, on their way to or from the altars, where in the gloom the twinkling tapers burn. The high altar is another work of Damian Forment's, and is of the same shape as the others already noticed. The tower of this church is fine; it is treated rather in a Moresque manner, something like the destroyed leaning tower which used to stand in the Plaza San Felipe, but more delicate.

Some of the houses of the old nobility and merchants are very fine, though rather over ornate. The most celebrated is that called Casa del Infante in the Calle de San Pedro, built in 1550 by Gabriel Zaporta. It has an entrance doorway with delicately worked pilasters and a beautiful iron balcony above, and the *patio* is most beautifully decorated with carved pillars, soffits and arches; figures are lavished all through the ornamentation, whether in medallion heads, caryatid torsos, or groups. The staircase is very delicate and beautiful, with a carved ceiling showing groups of musicians, and the arcading on the first floor is marked by the same qualities. After passing through many vicissitudes, and being used as workshops for various trades—the upstairs rooms being occupied as tenements—it is for sale, and will probably not exist much longer, being in a very bad state of repair. Other houses are noticeable, though not quite so much so; but all through the city the substantial style of building, the superbly carved soffits, rafters, and external cornices will strike the eye. The Coso is the principal street, and some of the most ornate and pretentious of the houses are to be found in it. There are many of them still pitted and riddled with shot marks, the honourable scars of memorable sieges.

The north-west gate, El Portillo, was the scene of the heroic deeds of the "Maid of Zaragoza." Outside it is the citadel, the Aljaferia, built originally by the Moorish king, Abu Giafar, and thence called Giafariya. It was assigned to the Inquisition by Ferdinand the Catholic, and in the French war was used as a barrack, then as a military hospital, and lastly was degraded into a prison. It has now been rebuilt, and is used as an arsenal and barracks, and consequently contains nothing worthy of notice save the remains of a little mosque, though the attendants take the unfortunate visitor with pride through wearisome rooms, containing interminable racks of guns, before allowing him to see what he wants to see.

The market is filled with picturesquely costumed peasants, and with heaps of fruit and vegetables, making glowing combinations of colour, and such groups may also be seen at the fountains, though the national costumes are dying out even here in conservative Spain, and the universal Manchester print and galvanised iron pail threaten to drive picturesqueness from its last strongholds. One can still buy *botas*, the leather bottles which travellers sling at their sides and on the saddle peaks of their horses, and gourds grown for a similar purpose are also to be had.

The Zaragozans spend a great deal of their time in the open-air, and on *festas* make little excursions to certain *fondas*, or inns, some distance without the walls, where they enjoy themselves with eating and drinking and dancing. Those who visit the town towards the end of June may see them thus employed on the two festivals of St. John Baptist and St. Peter, which are specially observed.

Mention of the Exchange or *La Lonja* must not be omitted. It faces La Seo, on the other side of the Plaza, which also has its beds of flowers, and is not far from the bridge. It was built in 1551, and it is a square brick building, with little turrets at the corners, and is ornamented with heads of kings and warriors let into circular frames in the manner of Holbein. The doors are studded with great nails and plaques of metal. The interior contains Doric columns and a fine staircase and ceilings. Needless to say it is not now used as an exchange.

Under Saracen dominion Zaragoza was at first a seat of provincial government, and afterwards the capital of an independent

kingdom. Here, as elsewhere, the Moor applied himself to agriculture, and the Ebro became known as the "River of Fruits," from the orchards through which it ran. The climate was so dry that provisions did not decay; and grain of all kinds could be preserved for an indefinite time.

The Sultans and Walids entertained philosophers and poets at their courts, though science was never pursued by them with the enthusiastic ardour of the Khalifs of Cordova and the princes of Toledo, who devoted consecutive days and nights to the solution of its fascinating problems. As the capital of Aragon, a kingdom gained foot by foot from the infidel, and whose inhabitants have never ceased to manifest the greatest jealousy of any infringement of their time-honoured liberties, Zaragoza has always exerted a more weighty influence in matters political than any other city of its size in Spain.

The forms of a constitution were observed in Aragon from the most ancient times, the royal authority being so abridged and curbed by restrictions as to make the power of the Sovereign merely nominal. The crown was elective, and the oath of allegiance taken by the nobles commenced with the phrase "We, your equals." The courts of justice were open to all; if the plaintiff were too poor to prosecute his suit, the Government was bound to furnish him the means, and provide him with counsel. Liberty of the individual was protected by a proceeding something like *habeas corpus*. Judges held office for life, and, while they performed other than judicial functions, were held strictly responsible for the proper discharge of all their duties, any lapse in which was punishable by death. The integrity of the magistrates was further secured by a council of inquiry, composed of the chief dignitaries of the realm, and presided over by the monarch, which assembled once a year to examine into any complaints made against them. The "General Privilege" of the kingdom of Aragon, which corresponded to our Magna Charta, antedated it by twenty-three years.

THE County Hospital, Bedford, is being warmed and ventilated throughout by means of Shorlands' patent double-fronted Manchester stoves with descending smoke flues, which have been supplied by Messrs. E. H. Shorland and Brother, of Manchester.

LIST OF PRIZE-WINNERS.

SIR E. J. POYNTER, P.R.A., awarded the prizes gained by students of the Royal Academy Schools. The awards were as follows:—Landscape painting, A Bridge over a Trout Stream, Creswick prize (£30): Fred Appleyard. Painting of a figure from the life (open to male students only), silver medal: first, George Murray; second, Edward Francis Wells. Painting of a head from the life, silver medal: first, Mary Towgood; second, Fred Appleyard. Painting of a draped figure (open to female students only), silver medal: first, Grace Elizabeth Page; second, not awarded. Cartoon of a draped figure, Calliope, silver medal and prize (£25), George Murray. Design in monochrome for a figure picture, Joseph presenting his Father before Pharaoh—Gen. xlvii, 7, Armitage prizes: first (£30) and bronze medal, not awarded; second (£10), Frank Cadogan Cowper. Design for the decoration of a portion of a public building, Harvest prize (£40), George Murray. Set of six drawings of a figure from the life (open to male students only): first prize (£50) and silver medal, George Murray; second (£25), Frank Shelley; third (£15), Christopher David Williams; fourth (£10), not awarded. Drawing of a head from the life, silver medal: first, William Denis Eden; second, Annie Margaret Page. Drawing of a statue or group, silver medal: first, Fred Appleyard; second, Annie Margaret Page. Perspective drawing in outline (open to painters and sculptors only) the Summer House in Kensington Gardens, near the Fountains, silver medal, no competition. Model of a design, Endymion whilst asleep, is visited by Diana: first prize (£30), Stanley Nicholson Babb; second (£10); Alfred Bertram Pegram (disqualified, owing to having received the same prize before). Set of three models of a figure from the life (open to male students only): first prize (£50) and silver medal, Gilbert William Bayes; second, (£20), Alfred Bertram Pegram (disqualified, owing to having received the same prize before). Model of a bust from the life (open to female students only), silver medal: first, not awarded; second, Winifred Florence Hunt. Model of a design containing figure and ornament, Youths gathering Grapes, silver medal, Stanley Nicholson

Babb. Model of a statue or group, silver medal: first, Frank Arnold Wright; second, Stanley Nicholson Babb. Design in Architecture, A Town Church, travelling studentship (£60), William Hawke. Set of architectural drawings, The Hall of the Middle Temple, silver medal: first, no competition; second, no competition. Set of architectural designs (upper school), prize (£25), John Stevens Lee. Set of drawings of an architectural design (lower school), prize (£10), Alfred Edward Corbett. Plan of a building, A Town Club House, prize (£10), Arthur Campbell Martin. Original composition in ornament, silver medal, no competition. Perspective drawing in outline (open to architects only), The Interior View of the Library at Lambeth Palace; silver medal, no competition. The Landseer scholarships, in painting, of £40 a year, tenable for two years, have been awarded to Frank Shelley, Arthur G. Ackermann, and Christopher D. Williams (extra). In sculpture, to Gilbert W. Bayes and Mortimer J. Brown (extra).

THERE has just been completed, at the suggestion of Her Majesty's Government, a survey of the harbour at Famagusta, on the east coast of Cyprus.

A PORTRAIT of the late Alderman Emanuel Whittaker, one of late Mayors of the borough of Oldham, and the head of one of the oldest firms of builders in the district, has been presented to the Oldham Corporation for their permanent collection. The portrait is the work of Mr. Sam Stones, of Ashton.

THE Salvation Army Building Association, which went into liquidation, has made arrangements under which all the shareholders will receive back the full amount of their shares, together with a small dividend. A final instalment of 15s. per £1 share will shortly be paid to the shareholders.

WE have received the constitution rules of the Employers' Parliamentary Council (representing the employers' associations of the United Kingdom), the president of which is the Earl of Wemyss. The main objects of the Council are explained by Rule 6, which says: "The Parliamentary Council shall draft, sign, and present to Parliament petitions in favour of or against any Bills in respect of which action is taken by the Council." We wish the Council every success.

CONDITION OF THE DOGE'S PALACE, VENICE.

AFTER making a careful investigation, we now publish a report upon the true condition of the Doge's Palace, says the *Adriatico*. The subsidences are not all due to the enormous weight of the volumes composing the library of St. Mark, although they form a constant danger to the edifice. Subsidences have been observed in three of the principal parts of the building, and the wall, for some reason, is not in a position of stable equilibrium. In any case it is necessary to take measures for removing, if possible, all causes of subsidence. The points of movement are on the corner of the Ponte della Paglia, on that adjacent to the Ponte di Canonica, and on that by the Porta della Carta. We are unable at present to state the true causes of such movements, but it is ridiculous to attribute them to the oscillations mentioned by the architects of the District Committee. Other causes must exist, which must be discovered and removed at any cost. The movement at the corner by the Porta della Carta is apparent on the walls and arches, especially of the Sala della Scrutinio, which may possibly be due to the remains of the tower of the old Palace, which is said to have been built on a narrow foundation. At all events, cracks have continued to appear and to spread. The greatest vigilance is required, and they should not be neglected. On the corner overlooking the Ponte di Canonica, a more noticeable movement by cracks and displacements is visible, especially in the Sala del Senato and the Sala del Collegio (where the Doge and his Counsellors give audience to Ambassadors), and still more in the small church and ante-church, in which, in addition to cracks, the posts of the doors are out of position, so that some of the doors cannot be closed.

A VERY WEAK POINT

is that fronting the Canal, over the entrance by water, and here the cracks are, perhaps, of more importance. There is a break in the

Senators' Staircase, and here the movement is more evident. The steps are slightly separated from the walls, thus demonstrating that the lateral walls are not in a state of perfect stability. This movement tends towards the ground floor and the centre of the building. The column standing at the water entrance is not in a good position. The weight upon it is not uniformly distributed, and it shows cracks, which are constantly increasing. One of the reasons for this may be the abandonment, for seven or eight years, of the works commenced for testing the stability of the inner corner by the Ponte della Paglia. But the gravest reason is the great weight of the volumes of the library, which is increasing every day, owing to new books which are sent there. The props which now support the floor of the library were not erected to carry such a weight. Following the order of the Giunta della Belle Arti, we now come to the question of

WORM-EATEN WOODWORK.

After five centuries of filtration of water and damp, the heads of the beams at the junction with the walls in the Ducal Palace may be almost completely destroyed. Several beams were removed in such a state as to leave a great part of the upper floor supported solely by the cohesion of the cement of the flooring. Three halls of the library are now shored up, but merely as a precautionary measure. The beams in the Quarantia Cavile, one of the halls which appears to be most damaged, have been seriously bent. This curvature produces an effect different from that which is caused merely by the compression of walls supporting the beams. It was declared two years ago that some cracks appeared on the ceiling of the old Hall of Manuscripts, and, that ceiling having been demolished, the beams were found in a very good condition. But why, if they were good, were they changed? Where are the old beams? We know that not one of those beams could be used. The ceilings in several halls have

GIVEN WAY,

and the pieces have been lost. We have ascertained that many wood decorations fall

and are collected. This is not a proof that they are in a good state of preservation, and the fact of collecting and putting aside pieces without perhaps even knowing to what ceilings they belonged is not reassuring. We ourselves are persuaded that the ceilings will not fall either today or tomorrow, but it is not logical to wait for them to fall, or for some precious paintings to be damaged in order to adopt necessary measures. It is true that in one arch the metal clamp is wanting, because it is under repair; it is also true that the arch is shored up—but it is equally true that the arch has been in this condition for more than two years. With the Sala della Scudo, owing to movements and the presence of large iron bars, some capitals have been broken and portions of them have fallen down. The curvature of the wall occasions internal filtration of water, the consequence of which cannot be precisely ascertained, as they may not only damage the walls, but also spoil some paintings which could not be replaced. These facts seem to fully justify the action of the Junta of Fine Arts, which could not divide the responsibility falling upon it with the architects of the District Committee in Venice. So far the Adriatics. But the local authorities to some extent contradict these alarmist reports, which they state originated with two members of the Giunta della Belle Arti, who recently visited the palace (one being an architect and the other a painter). After a superficial examination of the building, and without communicating with the local authority responsible for the care of the palace, these gentlemen gave publicity to the alarming statements quoted above. It is satisfactory to learn, on the authority of Cavaliere Berchet, the Director of the local Department for the Preservation of Public Buildings, and Signor Rosso, the architect attached to the Department, that there is no ground for alarm with regard to the safety of the building, and that there is no necessity for any repair beyond what is already in hand. All that needs to be done is to remedy a slight settlement, a few broken lintels and arches, and the dilapidation of the carved work in the Marcian Library.

COURTYARD OF CASA DEL INFANTE, ZARAGOZA.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
January 4th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

ONE of the most startling sensations of the year has been the merciless exposure of the management of the South Kensington Museum as a result of the inquiry into the methods of the Science and Art Department, held by the Select Committee appointed for the purpose. A great many serious mistakes in policy, and much carelessness of administration, were definitely condemned in the report, and a series of recommendations were made, which, if properly carried out, can scarcely fail to add greatly to the usefulness of the Museum. The report was a particularly full and exhaustive one, dealing at length with all sorts of details; and it was stated in terms sufficiently explicit to leave no doubt in the public mind as to the necessity for the changes suggested.

CONSIDERABLE interest is likely to be aroused by the rapidly-approaching completion of the Great Central Company's Metropolitan headquarters, off the Marylebone Road, as over a quarter of a century has now elapsed since St. Pancras, the last of London's great railway termini to be erected, was opened. Not only is Marylebone on a far more modest scale than the Midland Company's huge structure, but its plan entirely differs both from the latter's and those on which the Metropolitan termini of other railway companies have been arranged. The station itself is entered by an approach on the eastern side of the hotel, and consists of three clerestory roofs, in aggregate 155ft. broad, resting on columns and covering two island platforms and six sets of rails. Its modest proportions may, therefore, at once be guessed, for this arrangement provides only two departure and two arrival platforms. All the station buildings are of uniform pattern—namely, red brick, with terra-cotta dressings. The architectural design is simple; the frontage facing the hotel, from which it is separated by a broad roadway, might be that of an important country station; certainly it is totally different from that which one usually associates with a London terminus. The station will be supplied with both gas and the electric light, and for the latter eight dynamos are being installed on the premises. Immediately adjoining the station, and on the eastern side, in the triangle formed by Park Road, are located the horse-loading docks, the milk and fish platforms, and the carriage cleaning sheds, all in the order named. It will be seen, therefore, that the new terminus is compact enough, and that, unlike those of other companies, notably the Great Western and North-Western, trains of "empties" will not have to be sent out several miles in order to be prepared for their next trip. Everything, with the exception of the locomotive running sheds, situated at Neasden, is on the spot.

At last the Improvements Bill of the London County Council, embodying the scheme for a new street from Holborn to the Strand, has been deposited in the Private Bill Office. It

is proposed that the new street shall leave High Holborn opposite Southampton Row, and proceed southerly, intersecting Great Queen Street, Sardinia Street, Vere Street, and Stanhope Street. At this point it will bifurcate; the western branch will enter Catherine Street and the Strand close to Wellington Street, so as to form an approach to Waterloo Bridge, while the eastern branch will pass through New Inn to the Strand at St. Clement Danes Church. The main street and the two branches will all be 100ft. wide. It is proposed to widen the Strand for a considerable distance on the north side from St. Mary's Church, and to acquire the whole area bounded by the Strand and the two branch streets. The cost of the necessary property is estimated at £4,442,000, and the recoupment is expected to yield £4,088,300. The cost of works and of rehousing persons displaced is put at £420,000, making the total estimated net cost of the improvement £774,200.

At the prize distribution of the Chester School of Science and Art and Technical Schools, the Duke of Westminster, in emphasising the importance of architectural training, said how people could be content to live in villas with 9in. walls and bow windows facing north, with perhaps nothing to look at, was beyond him to be able to conceive. He feared that some of our descendants would never know what really Old England could show in the way of Architecture. In some of the older parts of the country—Hampshire and Wiltshire—there were to be seen very simple and beautiful buildings that had stood the test of time, but were now getting old, and perhaps our descendants would miss what we had been able to enjoy in the sight of beautiful buildings, not very expensive, but suited to their purpose. A square wall with four square windows just cut in that wall, a door in the middle, and a slate roof, could not be a very beautiful object.

WITH regard to Mr. Lethaby's writings upon the ruffianly restorer, the St. James's Gazette thinks more abuse than is exactly just has been lavished upon this unfortunate person, who is often only called in when absolute decay compels strong measures if the fabric is to be saved from utter ruin. We are not of the opinion that it is better to allow a masterpiece of any art to crumble into total ruin by degrees. If the world's best pictures and finest buildings could vanish suddenly like the Deacon's Post-chaise, it might, perhaps (being irrevocable), be the best solution of the worst problem that awaits posterity. But we have to face the fact that ever since their first construction the sound of mallet and chisel has scarcely ceased at all upon the greatest of the cathedrals all over the face of Europe. Many of them took so long to build, that when the last finishing touch was put to a western façade in the sixteenth century, the transept and choir of the thirteenth stood already in grave need of attention to the more weather-worn of their external details. Cologne Cathedral was only completed according to the original plans eighteen years ago.

But it seems to be an acknowledged fact that the inspiration which gave us the cathedrals has vanished with those temporary accidents of commercial economy which enabled the mediæval master-masons to be sure of loving and unhasty work. If that be so, and if the spread of artistic education be still insufficient to compensate for modern conditions of deteriorated workmanship, a still stronger argument is provided not merely for preserving all the ancient art we have, but also for following, wherever Time has saved them, the suggestions of the old designers. What havoc can be wrought by neglect of this obvious precaution may be seen by the miserable frigid modern distortion clapped on to the western façade of St. Ouen, although the original drawing and half of the original masonry actually existed in Rouen. But we are chiefly moved to these remarks by the sudden appearance of two white blemishes on the mellowed façade of Notre Dame, in Paris. White marble statues of Adam and Eve have

been put up on the west front. The guardian will tell you that they are to be "coloured in harmony with the rest." The Sainte Chapelle is already ruined; and the Palace of the Doges is in peril.

MR. ALGERNON ASHTON, that diligent keeper of the tombs, contradicts a report current lately that the grave of Constable, the painter, in Hampstead Churchyard, is in a neglected condition, but he says that another noteworthy resting place in the same churchyard—that of Joanna Baillie, the poetess—is in a bad state of neglect. The massive gravestone is mouldy and crumbling to pieces; the inscription can now hardly be deciphered, and the iron railing has become entirely rusty.

It is with regret we hear that Petersham Church is to be rebuilt by the purchaser of the Bute House Estate, who will add thereto a parish institute. The latter is no doubt a very praiseworthy idea, but the rebuilding of the church is surely a misfortune. It is practically certain that nothing so perfectly in accord with its surroundings will take its place; its little red-brick tower with quaint bell turret above, its tiled roof and time-stained plastered walls peeping out of a wealth of vari-tinted greens, all combine to produce, or rather compose themselves into, a dainty little picture that has been the subject of many a painter's brush. Nor is it without associations with the famous ones of bygone times. Here lie the bones of Vancouver the explorer, whose name lives in Vancouver Land; he was buried here in 1798. Here, too, lie Agnes and Mary Berry, the famous blue-stocking spinsters, whose society everybody courted, and who were so dear to Horace Walpole that he addressed them as his "twin wives," signing himself "Horace Fondlewives," and to whom he bequeathed, jointly, "Little Strawberry Hill," a house already famous as the abode of Kitty Clive. Mary, the more distinguished of the twain—Walpole's "Suavissima Maria"—was buried at Petersham in 1852. Another writer, the versatile Mortimer Collins, whose fertile pen produced many a pleasant volume, the most successful of which was "The Secret of Long Life," was buried here in 1876.

EXTENSIVE improvements to the interior of Cork Cathedral are now approaching completion. The entire church has been redecorated by Mr. John O'Connell, and special attention has been given to the treatment of the grained ceiling, well known as one of the finest examples of florid Gothic Architecture in the country. The baptistry is a chaste piece of decoration, the ceiling panels being occupied with symbolic panels typifying the descent of the Holy Ghost, the prevailing tints of blue and silver harmonising well with the warm colouring of the church. The principal lighting is from lamps placed on the caps of the clustered columns, the result of this arrangement is to give a soft light, perfectly diffused, and well above the line of sight. This portion of the work was carried out by Messrs. Porte, Sykes and Company. The old gallery front has been removed and a new one substituted more in keeping with the style of the church; cusped segments beneath serve to break the horizontal lines. A mortuary chapel is in course of erection by Messrs. E. and P. Flynn, builders. Two new stained glass windows are at present being fixed. When all is complete the cathedral will be the most elaborately decorated church in Munster.

In commemoration of Bishop Lightfoot, whose notable services to the diocese of Durham are still gratefully remembered, a very remarkable window has been placed in the church in Sunderland. It consists of nine pictures, illustrative of the late Bishop's life and work, interspersed with scenes and allusions to Scriptural and Ignatian times. These form a very bold blending of the ancient and the modern. The window is one of the most remarkable ever placed in an English church, and begins a revolution, so far as subjects for treatment are concerned, in ecclesiastical fenestral ornamentation.

DECORATIVE STONE WORK AS APPLIED TO ARCHITECTURE.*

BY WILLIAM VICKERS.

(Continued from page 331.)

ON Gothic work I cannot say that I am well pleased with the treatment it receives. A great deal of it reminds me of the notice that is frequently sent out from chemists' shops—"To be well shaken, &c." Well, it does seem to have been well shaken in some localities. Possibly I am a little severe in my views to suit some people, but I must emphasise my resentment to this mixing of early Gothic carving and mouldings with the ball flower ornament upon the same doorway, dog-tooth ornament and ball flower apparently trying to shoulder each other out, seemingly in dispute as to which had the right to be there. Late decorated crochets, quite correct upon an ogee moulded label, section of moulding also correct, but Early English ornament for the label termination. Now once again any carved ornament incongruous to the style of Architecture is an abuse of decorative work. These discrepancies should not occur on good architecture, and it either arises from what I shall term a want of knowledge or carelessness. I know of some modern churches where the late and early architecture are blended together. This sounds rather like a distiller's term. Perhaps the idea is taken from that industry, for the blending of several kinds of liquids help to make a success, consequently this blending of the early and late was desired to have the same result. But here the blending fails.

I have been told in regard to a single building where the mouldings have been a little mixed, that if it is a late Gothic label to put a late Gothic terminal, and if its neighbour should be of early work, then make terminal to harmonize with it.

With respect to church furniture, such as stalls, pulpits, reading desks, &c., that is another matter. I do not mind seeing these of a period of Architecture other than that of the church, providing that they are pure and unmixed. I should not go so far as was illustrated to me a short time ago by a minister of religion, who, in referring to an early Gothic church in London, in eulogistic terms said: "The church fittings were also in accordance with the architecture, even the choir boys' surplices had the same treatment in their manufacture, and the face of the minister of this truly Gothic church and surroundings likewise carried the same impress."

In enumerating a few examples, I will commence with Early English work. It will be admitted, I think, that in England there is more elaborate work, and a greater proportion of it, in the cathedrals, abbeys, and churches than what Scotland can boast; nevertheless, you have some very excellent work in Scotland: Glasgow Cathedral, Melrose, Elgin, and Holyrood Palace Chapel—at the latter place I found some good ornament resembling the English work. Of this period in England I will mention York, Salisbury, Wells, Lincoln and Lichfield for this purpose. I suppose it will not be known to all of my hearers that there is a great variety of treatment in the mouldings and carvings of this work, each cathedral having quite a distinct character—so much so, that I have heard architects giving their instructions to carvers before starting their work what particular type must be carved upon this building. Some would prefer Salisbury, this being much smaller in the mouldings, and likewise the carvings; others, again, would require you to give the Wells treatment—here, again, the treatment is larger and bolder.

There is also Stone Church, in Kent—a magnificent building with also a slightly different treatment. Amongst other good

examples are some spandrils that I know will be familiar to art students. There are, I think, just two used in these institutions, but at the church they continue and are varied all round the apsidal end of the chancel. In looking at this period of Architecture what do we observe. The lancet windows full of vigour, the moulding of arches bold and deeply cut. And what of the ornament? Foliage of a type that lends itself to the mouldings: capitals with Bosses, having open parts between, laying bare the bell mould of the cap, giving depth of light and shade agreeing so perfectly with the masonry that no other ornament could be conceived to take its place. Of transitional work in England which succeeds early English, a period where the moulded work is not quite so bold, coming between early English and the

it required a special ornament for these men to apply to it, and where could they derive it from if not from Nature. Then the conventional forms were cast aside, the craftsmen of those times had recourse to the natural forms, and so applied to their capitals and other work examples as nearly resembling Nature as it were possible for human hands to make in stone.

Of late decorated work England is very rich in examples, and Scotland has some very fine ones also: Melrose Abbey, Linluden Abbey, and Paisley Abbey. In the ruined parts of the latter, although decayed, there is some good work. I will mention of English work: the Percy Shrine at Beverley Minster, and the Lady Chapel, Ely Cathedral as being the finest I know. It is really marvellous this work, both masonry and carving, the executing

THE TOMB OF LADY ELEANOR PERCY, BEVERLEY MINSTER. FROM A PHOTOGRAPH BY C. C. HODGES, HEXHAM.

next and more distinct period of early decorated, but having parts of both, we find that the ornament is studied to go with it, the surface of the capitals are not broken into so much, and the carving is of a finer and more delicate treatment: mouldings smaller and more members, carvings with general outline much the same as early English leaves, but with serrations, thereby bringing it into scale with the masonry. The best examples that I know of this period are at South Hayling Church, Hants, Bishop of Bridport Memorial, Salisbury Cathedral, and York Minster. The Early Decorated period, I mention first Southwell Minster, but there is also good work at York, Selby Abbey, and Lincoln. There is great purity and refinement in this work, the mouldings of that date being of such delicacy that

of which required the carver to be a mason, and *vice versa*, the running together of different parts with such uniformity. The mouldings of this period began to take the form of the ogee in many of the sections, therefore, although the natural forms were kept in the carvings, the surfaces of the leaves were of that undulating kind that the sections of the mouldings could be observed also repeated on the carving. The perpendicular Gothic, the last but by no means the least of the true Gothic styles, follows. This is also truly wonderful. Take Henry VII's Chapel at Westminster, Oxford and Cambridge Universities, King's College Chapel, Hampton Court Palace, Bishop Alcock's Chapel, and Ely Cathedral. For the student, either mason or carver, who is desirous of knowing what it is to be conversant with

* A paper read before the Glasgow and West of Scotland Technical College Architectural Craftsman's Society.

decorative work, there is a mine in any one of these places for study. In putting the periods in this form, I know I am not conveying information to some of you, but I do so in order to make it clear to all that there is such a difference in the treatment of each one, and by these few fragments of specimens I have shown that I wish to more fully illustrate it.

Following the Perpendicular Gothic we have the Debased style, which has proved to be a boon, and a very interesting one, to architects and carvers also—a style that has contributed a very great deal to what architects were pleased to call “a new style.” There are some good specimens of this mixture of Classic and Late Gothic in some parts of England, and I remember copying some of that which came from Christchurch at least twenty-five years ago. There is another source with a foreign element in it which I like, and it gives great scope to the carver. This is the working together of the Flamboyant and Classic. The best of this work that I know is at Chartres Cathedral and Rouen. It does not seem to have been worked upon much in Scotland, but Mr. Washington Brown has favoured it a little both in Edinburgh, and slightly on a building in Buchanan Street, Glasgow. It certainly seems to me that there is a want of a little more knowledge on the part of the Scotch masons and carvers into the details of Gothic, which is much against themselves. In looking back for the last ten or twelve years at the amount of work that has been brought into this country from England we hear often an expression, “made in Germany,” which jars upon our ears, but we might say as regards a deal of artistic work in stone, “made in England.” For one denomination alone it would average nearly £1000 per year. And why? Simply because it could not be done here, and this state of things has been so engrafted into the minds of those people who require the work through long use, or abuse, that you cannot persuade them into giving up the old source. This state of things could be remedied, and how? Simply by making the Mediæval work—not only the carving, but the masonry—a study. I stated in one part of my paper that I would refer to the requirements that were needed to assist in this education. I chose the latter part of my paper for the reason that I wish to make an appeal on behalf of the craftsmen for something which your institutions, good though they may be, cannot impart. What I wish to see is a museum that is worthy of the name—an architectural Museum, not a structure with all the available funds lavished upon the exterior, but one well filled with casts, whole façades, or fronts of buildings, and not confined to Great Britain, but from the Continent also. You may feel dismayed at such a proposal, but look at our Continental neighbours. The Trocadero in Paris, the interior built up with casts of some of the finest Classic and Gothic architecture, taken from the great porches of their cathedrals, pulpits, fonts, monuments, fountains, and everything with any architectural merit in it—not satisfied with the work of their own country, but also magnificent examples from Italy and Greece, brought together regardless of expense, chiefly, and I might say solely, to educate their craftsmen.

We have in London at South Kensington an Architectural Court, which, though very grand, cannot compare with the Trocadero. Also at the Architectural Museum in Tufnell Street, Westminster, which is more devoted to ornament, is a very remarkable collection. I do not advocate this kind of museum. I wish for a more architectural element, so that our masons will have an equal share of study, with a reference library filled with all the useful works upon Architecture.

I think there are in Glasgow too many small shows, that are made to embrace too many subjects, or that we require just this one more, devoted entirely to my proposal. Some may think that we have ample in the way of reference libraries. What we have are really very good, but, unfortunately, in the wrong place. I suggest that the reference library should be attached to the Architectural Court in a similar way to the library at South Kensington. I have had many occasions to go to the Mitchell

Library, and have, after much trouble, found the book of reference that I required, but when I have attempted to make a sketch or note, have scarcely found elbow-room, being packed close to other visitors. Even Edinburgh leads the way for the Glasgow citizens in their attempt to procure an Architectural Court of Casts at the Royal Institution. But I feel sure Glasgow will not be behind. Possibly that stately building in Kelvin Grove, now rearing itself up in such dignity, may be arranged to supply all their needs, and if so, I hope and trust that nothing will be spared to make it a success. In conclusion, I wish to say that masons and carvers cannot travel to see all these great monuments of art; but bring them to their doors in a sense, let them have ample opportunities, as compared with their, or our, continental brother craftsmen.

SHAM BUILDING IN SAN FRANCISCO.

THE Baldwin Hotel fire in San Francisco was the result of sham building. This great six-storey structure was made to resemble an edifice of the most substantial and permanent character, but was in reality a mass of wood and gilding. Its size and magnificence gave its owner and the rest of San Francisco much pride. It was pointed to as an example of the greatness of the city, particularly in the days when it was new, and when few towns had anything that equalled it in appearance. Not that the sham was of the nature of a deception as to the fireproof qualities of the hotel. It made no pretence to being fireproof or even slow burning. It was frankly recognised by everybody as a fire-trap. It was a big house of cards, and its patrons accepted it as a house of cards, and preferred a vast and imposing card pile to a more modest structure of less dangerous materials. This sort of honest sham building is particularly common in new cities. The instant a man attempts to build a hotel in a place where the great expense of fireproof construction is not warranted, his temptation is to put up a great building of many stories to create a metropolitan impression, and the result is almost invariably a

FIRE-TRAP.

He thinks that if he should frankly adapt his plans to his materials he would rob his house of half his glory. Even the builder of a country hotel who has all the land he can possibly need prefers to erect three and four story piles of pine boards to getting the same amount of room out of a two-story building with larger ground space. A low building would be safer and more appropriate, but it would not be sufficiently indicative of city improvements. In San Francisco another reason led to much imitation of stone in wood. When the Baldwin and many of the great private houses were built, in the seventies, high brick buildings were not considered safe because of earthquakes. Consequently persons with ambitions in the direction of monumental structures adopted wood as their building material. Since that time the invention of

STEEL CONSTRUCTION,

which gives a structure a frame as of a bridge able to stand shaking, has led to the erection of great blocks in San Francisco of a thoroughly safe and substantial character. The mistake of the earlier builders was their unwillingness to follow the Spanish custom and adapt their houses to the natural conditions and climate. Great low buildings would have been more comfortable for house or hotel than wooden skyscrapers, but ambition for imitating Parisian palaces carried the day. Baldwin's was one of these, and it has paid the penalty for its shamming. One defence of high buildings that are not fireproof sometimes made is that land in towns is too valuable to be wasted on low structures. But this is hardly a good defence, for if natural conditions such as earthquakes do not warrant a really substantial building of materials corresponding to appearance, then the true value of the land cannot be such as to call for the size of building put on it.

A NEW THEATRE AT BIRMINGHAM.

MR. THOMAS SERGENSON, proprietor of the Grand Theatre and Opera House, Blackpool, proposes to erect the new Alhambra Theatre, with suite of shops, arcade, offices, &c. at the top of Corporation Street, Birmingham. In December last, says the Birmingham Daily Gazette, the Corporation granted Mr. Sergenson 75 years' lease of the plot of land—now occupied by the Royal English Circus—opposite the Victoria Courts, and on this site he intends to erect a theatre which may be made adaptable to the purposes of a circus or any other form of high-class entertainment. The total area of the site is 2800 square yards, and it is let at a yearly rental of £1050. The plans, which have already obtained the sanction of the Improvement Committee, have been prepared by Mr. Frank Matcham, of London. The site for the proposed Alhambra Theatre has a frontage to Corporation Street of 225ft., to Ryder Street of 113ft., and to Dalton Street of 285ft. The building will be arranged on the most modern lines both in regard to the character and decoration of the auditorium, stage equipment, and in other respects. The main entrance will be placed at the corner of Ryder Street and Corporation Street, but the whole frontage in the latter thoroughfare will be devoted to eight shops with either residential chambers or offices above. The property on the Dalton Street side of the building will be utilised as warehouses, or business premises of similar description, and an arcade will run from Corporation Street to Dalton Street containing ten other shops or offices. The stage—at the John Watt Street end of the site—will be 70ft. wide by 45ft. deep, with the necessary dressing-rooms, &c. The pit, which will be on the floor level, will provide accommodation for 800 persons, with 150 stalls immediately in front. The dress circle and stalls will be reached by means of a spacious vestibule and staircase in marble and mosaic, opening out at the corner of Corporation Street and Ryder Street. A decided novelty will be noted in the placing of the private boxes—five of them—at the extreme back of the circle, instead of at the sides nearest the stage. The dress circle will seat 275 persons, which, with the 25 provided for in the boxes at the rear, will bring up the accommodation in this part of the house to 300. In the upper circle, and in the gallery above, the accommodation will be on proportionate lines. Special attention has been paid to the exits. In no case will there be less than two separate exits, and in some cases as many as four are provided from the various parts of the house. The passages and staircases forming these exits are to be built of fireproof materials, the latter having handrails on both sides, and in addition the principal staircase will be provided with a handrail down the centre. All doors will be made to open outwards, and be fitted with patent exit bolts. The scheme of decoration will be Moorish throughout. The total cost of the buildings is estimated at something between £70,000 and £80,000.

THE Town Council of Glasgow has decided to erect a new bridge over the Clyde at Govan Street, Glasgow Green. It is intended to make a 50ft. bridge out of the material of the existing temporary bridge at Jamaica Street.

A SERIES of most instructive visits have just been paid on Saturday afternoons by the students of the architectural department of the Glasgow and West of Scotland Technical College. The structures visited in course of erection were Ruchill Hospital, Pollokshaws Town Hall, and Glasgow Bridge. One afternoon was spent at the Sewage Purification Works; another at the Cathedral, where Professor Gourlay conducted a special Architecture class visit for the study of the vaulting; while on a third the Honours Stage students joined the Craftsmen's Society on a visit to the Weir, now being constructed on the Clyde. All these visits were very largely attended.

THE FEUDAL PRINCIPLES OF REAL PROPERTY LAW.

BY WILLIAM H. STACPOOLE, LL.D.

PART III.

THE effect of the celebrated statute 12 Car. II., ch. 24, was, as we saw in the last article, to reduce all tenures of land in England to free and common socage, except frankalmoin, grand serjanty, and copyhold. I propose now to consider, first, the nature of free socage, and then of copyhold, which grew out of villenage—either pure villenage, where the services were both base and uncertain, or villein-socage, where they were base but certain. Afterwards we will consider the character and history of what are called estates in fee simple and in fee tail.

The derivation of the word socage has given rise to a good deal of controversy, some getting it from the Saxon word *soke*, a plough, but according to what appears to be the better opinion, it comes from the Saxon *soc*, meaning jurisdiction, and referring to the jurisdiction the lord had over his tenants at the time of the Conquest. Waiving, however, any discussion on this point, socage denotes the tenure of land by any certain and determinate service; it is in the quality of the services it involves as being certain, so that they are capable of being fixed beforehand, that the socage tenure differs from the tenure in chivalry or knight's service, where the services, depending as they did upon contingencies of a military nature, could not be exactly pre-ordained.

The tenure of land by knight's service undoubtedly existed in England long before the Norman Conquest,* though it was not so widely diffused as afterwards, and it was, perhaps, for this reason that the socage tenure, which was of Saxon origin, became so imbrued with the feudal spirit as to be itself of the feudal nature. It is described by Blackstone and Sir Martin Wright as an *improper feud*; the epithet "*improper*" referring only to the services attached to it not to its essential nature. Thus Blackstone says that socage "partakes very strongly of the feudal character," and so in Wright's "*Tenures*," where five canons are laid down with regard to improper feuds. The third is as follows:—"That *improper* feuds are distinguished from *proper* feuds by such qualities only as are varied or superadded to the feud by express provision of the parties, and that they in all other respects retain the nature of an *original feud*," p. 36 (1730). Again (*ib.*, pp. 145-6), "All our English fees or holdings; whether they be frank or emphyteuticary, burgage or gavelkind (though burgage and gavelkind have many qualities different from common socage), do now fall under the notion of socage tenures, which, though they vary in point of service, succession, and the like, as *improper* feuds, do nevertheless retain the nature of feuds; inasmuch as they are held of some lord or superior, by fealty, and usually by some other certain service or acknowledgment; and inasmuch as they yield or pay relief, and may escheat."

As in the case of knight's service, so also in socage, land is held either of the king directly or of a mesne lord, who himself must hold directly or indirectly through another, of the king as lord paramount. Homage, which was an inseparable incident of knight's service (and abolished by the statute 12 Car. II., ch. 24), was rarely required from the tenant in socage, who, however, was bound to take an oath of fealty to his lord, and sometimes he owed no other service than fealty. Aids for knighting the lord's son and marrying his daughter (also abolished by the same statute) were incident to socage as well as knight's service, but these were fixed by statutes passed in the reigns of Edward I. and Edward III. Both tenures were subject to the feudal return, render, rent, or service of some kind or other, if only bare

fealty, which arose from a supposition of an original grant from the lord to the tenant. Relief also was incumbent on tenant in socage, as well as in knight's service, but in the former case, it was only one year's rent or render, be it great or small, while in the latter it was one quarter of the supposed value of the land. This relief not being touched by the statute is still due. Suit of Court and escheat (left also untouched) were and are still due from the tenant in socage. The practical superiority of socage before the Act (12 Car. II., ch. 24), was with respect to wardship and marriage, which in the case of an infant heir of a tenant in socage devolved not upon the lord (because, as regarded wardship, in this tenure, no military or personal service being required, there was no occasion for the lord to take the profits to provide a substitute), but on the nearest relation upon whom the inheritance could not descend. The guardian in socage had to account to the heir for the profits of his land, and for the value of his marriage, if he married him under fourteen, at which age the ward might have disposed of himself in marriage, without any consent of the guardian. Wardship and marriage were, however, as we have seen, abolished by the Act. Thus, to quote Mr. Williams in his well known *Principles of Real Property* (Part I., ch. 1, sec. 3, Ed. 18):

"A small occasional quit rent, with its accompanying relief,—suit of the Court Baron, if any such exists—an oath of fealty never exacted—and a right of escheat seldom accruing—are now, it appears, therefore, the ordinary incidents of modern socage tenure."

Of socage there were two kinds, as we saw in the last article, viz.: free socage, where the services were both certain and honourable; and villein socage, where the services, though certain, were base in kind, or unworthy of a free man. This villein socage exists to the present day as the tenure in ancient demesne—described by Blackstone as "an exalted species of copyhold" (Bk. ii., ch. 6); we shall consider it presently in connection with copyholds. Of free socage, we may say that it was the tenure by which freemen held their lands in England before the Conquest, and it is defined by Littleton to be "where the tenant holds his tenement of the lord by any certain service in lieu of all other services" (Littleton's "*Tenures*," s. 117). Burgage and gavelkind, which I shall describe briefly, are two species of free socage tenure, which were only feudalised after the Conquest, an exception being made in favour of those incidents (the result of ancient local customs), which were suffered to remain, though at variance with the new kind of tenure on which they were grafted, or, shall I say, to which their ancient parent tenure was changed.

The words burgage and borough are derived from the Saxon "*burg*," "*burh*," which meant originally a hill or mountain, and were afterwards applied to the little towns that grew up round the castles that were usually situated on hills for protection against assault. The termination age, as in socage, is from the Latin *agium*, denoting the services of the tenure.

Burgage tenants were tenants who held lands of their lords by socage tenure in towns, and so burgage is often spoken of by the older writers as town socage. It is thus defined and described by Blackstone (Bk. ii., ch. 6).

"Tenure in burgage, or burgage tenure, is where houses, or lands which were formerly the site of houses, in an ancient borough, are held of some lord in common socage by a certain established rent. And these seem to have withstood the shock of the Norman encroachments principally on account of their insignificance, which made it not worth while to compel them to an alteration of tenure, as an hundred of them put together would scarcely amount to a knight's fee.* Besides, the owners of them being chiefly artificers and persons engaged in trade, could not, with any tolerable propriety, be put upon a military establishment, as the tenure in chivalry was."

* Land of the annual value of £20 in the reigns of Henry II. and Edward II.

A city is a town incorporated, which is, or has been, the seat of a bishop. A borough is a town, whether corporate or not, that sends burgesses to Parliament, and this is the explanation of bury in the names of towns such as Canterbury, Salisbury, Bury St. Edmund, etc.

Burgage tenures are the ancient customs (meaning, thereby, customs that existed before the Conquest) of ancient boroughs. There are different species of these tenures, and concerning all of them we may lay down the following general propositions which will also apply to gavelkind and ancient demesne:—

1. They are essentially local, and attached to particular pieces of ground, so that, to use the words of Chief Justice Hale, "the custom is fixed to the land."*
2. For this reason (being fixed to the land) they cannot be either created, or transferred from one place to another, even by Act of Parliament or Royal Prerogative. "For the custom runs with the land and is by reason of the land,"† and "Customs receiving their perfection from the continuance of time, come not within the compass of the King's prerogative."‡
3. Where these tenures have once existed they always exist, until they are extinguished by an Act of Parliament. They cannot be "*changed nor extinguished* beyond a possibility of revivor, neither by alteration of the tenure, nor by possession of the King, nor by the act of the party, nor, indeed, by any other means but by Act of Parliament only."§

The most remarkable species of burgage is that which is known as borough English, where the youngest son, and not the eldest, succeeds to the tenement on the death of the father. This is called ultimogeniture, as distinct from primogeniture, and various reasons have been offered to account for it. Littleton supposes that the youngest son was preferred because, by reason of his tender age, he is not so capable as the rest of his brethren to help himself; and others have conjectured that he was selected to be heir because he was the most likely son to be found in the house at the time of the father's death. Another explanation is thus suggested by Blackstone: "Other authors have indeed given a much stranger reason for this custom, as if the lord of the fee had anciently a right to break the Seventh Commandment with his tenant's wife on her wedding night; and that, therefore, the tenement descended, not to the eldest, but to the youngest son, who was more certainly the offspring of the parent. But I cannot learn that ever this custom prevailed in England, though it certainly did in Scotland (under the name of '*mercheta*' or '*marcheta*') till abolished by Malcolm III.||

The word borough English is derived from burgh Engloyes, and came into use in this way. About the time of the Conquest a new French borough grew up beside the old English borough at Nottingham, so that the town of Nottingham was divided (it is believed until 1713) into the English borough to the east and the French borough to the west. In a celebrated case that was tried in Nottingham in 1327, it was found that while in the French borough lands descended to the eldest son, in the English borough they descended to the youngest son, and the lawyers, finding a name for the custom in the circumstances of the case, ultimogeniture, or the custom of lands descending to the youngest son, was called borough English.¶

Ultimogeniture, which we call borough English, and which is known abroad by such terms as "*Mainete*" and "*Yungsten-Recht*," is common among Ugrian tribes about the Ural Mountains, in Slavonic communities, the villages of Hungary, in Central Asia, and on

The substance of the case on this point will be found in Bishop Gibson's preface to Spelman's "*Treatise on Feuds*." See also Seldon's "*Titles of Honour*," pp. 513, 520; and Elton's "*Tenures of Kent*," ch. 13, 14.

the confines of China. It was unknown in Ireland and in Scotland, though, strange to say, it was usual in the Shetland Islands.*

Borough English, though the principal species, is yet only a species of burgage tenure. The following are examples of burgage of a different kind:—

(a) In some boroughs the widow has all the tenements of her husband instead of her third.

(b) In London, Canterbury, and other boroughs, the citizens had a custom of devising their freeholds within the liberties of the city. The wives of citizens of Canterbury enjoyed the same privileges.

(c) It appears from the Year-book, 11 Henry IV., 29, that the custom of some boroughs allowed the infant to alienate his property as soon as he could measure a yard of cloth. In other boroughs the infant was of full age when he could tell money, measure cloth, and the like. These customs were, however, subsequently disallowed in Hereford, Gloucester and Ipswich during the reigns of Edward II. and Edward III., on the ground that a custom to be valid must be reasonable.

(d) As an instance of what may be established by custom, Mr. Elton tells us ("Tenures of Kent," ch. 7) that, "In 53 Henry III., the jury, on an inquisition post-mortem, found that the heir of the said John Gerveis was of full age on the day of his birth, according to the use and custom of the town of Bridport (Dorset)."

When, to use a technical expression, a thing is said to be *judicially noticed*, what is meant is that the thing so spoken of is taken as being within the knowledge of a court of law, so that the court will not require any explanation or proof concerning it. Now, between borough English on the one hand, and the remaining species of burgage (amongst which there is no principle of uniformity, depending as they do on the customs of different localities) on the other hand, there is this important difference, that the former is, while the latter are not, judicially noticed. In the case of every other kind of burgage, it is necessary to prove two things; first, that the alleged custom does exist; secondly, that the land in question is subject to the custom. But in the case of borough English the only question that can arise is whether the land comes within the custom, for the custom itself is taken as being already known to the court. Gavelkind, I may here mention, is also judicially noticed.

Until very near the end of the reign of Hen. VIII., burgage tenants had this advantage over other tenants that they were able to devise their lands by will. This power was, however, given to all tenants by 32 Hen. VIII., ch. 1. and 34 and 35 Hen. VIII., ch. 5.

As I have already said, burgage (like gavelkind which we have next to consider), being "fixed to the land," can only be extirpated by an Act of Parliament. In their first report the Real Property Commissioners urged the following amongst other reasons why an Act should be passed to abolish borough English.

1. "That the youngest son is often a minor when the father dies. During the minority the land is unalienable and often mismanaged."

2. "It is difficult to ascertain the limits of the land covered by the custom."

3. "It is sometimes difficult to prove the extent of the custom sufficiently to satisfy a purchaser."

4. "There is a great deal of ignorance and a great likelihood of forgetfulness of what lands are subject to it."

* Elton, "Origins of English History," 186.

BRONZE statuettes, about 2ft. high, of the Emperor William as a knight of one of the crusading orders, are now being offered for sale in Berlin.

The present pile of buildings which stand in Bishopsgate Street Within, City, known as the "Wesleyan Centenary Hall and Mission House," was acquired at an outlay of £30,000. So enormously has the value of property in the City increased of late years, that the site on which the building now stands is alone estimated to be worth £230,000.

Professional Items.

ABERDEEN.—A new hotel is to be shortly erected in Guild Street, at a point almost directly opposite what will be the main entrance to the extended Joint Station. The new building will have a frontage of 60ft. to Guild Street, and will extend backward for a distance of 124ft. The plans, being prepared by Mr. R. G. Wilson, architect, show a building five stories high. The main entrance will be in the middle of the front. On the west side of the main entrance there will be a restaurant with open front to Guild Street. On the east side of the main entrance the corresponding ground floor space will be given up to two shops. The hotel itself will be built of grey granite.

BIRMINGHAM.—The formal opening of the Friends' Hall and Institute, Moseley Road, which has been erected by Mr. Richard Cadbury, will take place in May, but the building is even now sufficiently advanced that meetings may be held in it. As has been previously stated in these columns, the first part of the scheme was the erection of the institute in the Moseley Road, and the second part the establishment of almshouses and private dwellings at Bournville. The whole will involve an outlay of about £70,000, and the cost of the institute will be about £30,000.

DUMFRIES.—A new organ has just been erected in St. Andrew's Pro-Cathedral, Dumfries. It is by Messrs. Cousans, Sons & Co., of Lincoln. The great organ is provided with ten stops, and the total number is twenty-eight. Attached to the manuals and pedal board is a patent electric connection of Messrs. Cousans' which secures instant repetition.

FALKIRK.—A new United Presbyterian Church is about to be erected at the corner of Thornhill Road and the new street at Firs. The building, of which Mr. G. Deas Page, is architect, will cost £4000. In the Gothic style, it is being constructed of red stone from Locharbriggs Quarry, Dumfries.

GLASGOW.—In the ventilation of the large new warehouses erected in Ingram Street, for Messrs. J. and W. Campbell and Co., and designed by Messrs. Baird and Thompson, architects, "Cousland's Improved Climax" Patent Direct Acting Turret Ventilators have been used, supplied by the Climax Ventilating and Heating Company, Glasgow.

KIRKCALDY.—A special meeting of Kirkcaldy Harbour Commission was held recently, to receive and consider the report of Mr. Henderson, C.E., Burntisland, as to the proposed deepening of the harbour at the top of the east pier. The rock there is to be excavated to the depth of 4ft., which will give an additional quayside at that part of 50ft. The report was approved, and Mr. Henderson was instructed to see the work carried out to his satisfaction.

PENDEEN (Cornwall).—The Elder Brethren of Trinity House have lost no time in completing the preliminaries for the erection of a lighthouse and fog signal station at Pendeen, a particularly dangerous point on the north coast of Cornwall between the Land's End and St. Ives, which has been the scene of many a shipping disaster. The tender of Mr. Arthur Carkeek, of Redruth, has been accepted, and the work has already been commenced, although as yet it is principally confined to excavations. The plans have been prepared by Mr. Matthews, the engineer to the Trinity Board.

PONTYPRIDD.—The foundation stone of the "Eglwysbach" Memorial Chapel, which is now in course of erection at Pontypridd, has been laid. The chapel which, when completed, will cost £2300, will be a Corinthian structure, capable of seating about 500 persons. The builder is Mr. W. R. Davies, Barry Dock, and the architect Mr. Price Powell, Cardiff.

PORT ELIZABETH (South Africa).—Arrangements are now being made for the erection of a number of semi-detached cottage villas in Port Elizabeth. They will be constructed of timber throughout, except party walls and chimney-breasts, which will be built of breeze concrete. The outside walls will be covered with rustic joint weather boarding on felt, coated with "Carbolineum Avenarius" up to first floor line, and plaster above. Inside walls and ceilings will be lined with match-boarding, and finished with Hall's patent distemper; roofs will be covered with Italian pattern galvanised iron, painted in two tints on felting. All the lower timbers will be covered with two applications of Carbolineum to repel damp and white ants. The accommodation of each house will be living room, parlour, with large bay, small hall and stairs, pantry, washhouse, coals, and w.c. to ground floor, and three bedrooms on the first floor, all entered from a small landing, one bedroom having a bay window. It is proposed to have them made in England, shipped over in sections, and erected by local workmen on a bed of concrete. Messrs. Boulton and Paul, of Norwich, have submitted estimates for the construction and erection of twenty pairs, and the architect is Mr. George E. Clare, of Chelmsford.

ROTHERHAM.—On a site immediately above the Crown Hotel, in Moorgate Street, the York City and County Banking Company has built a branch bank. Grey Aberdeen granite has been used up to the first floor level, from which point there is brickwork, with stone dressings. The bank itself measures 30ft. by 24ft., and is 15ft. high. The floor in front of the counter is of mosaic work. There is a strong room, manager's room, &c. Manchester tiled work has been plentifully made use of in the entrances, lobbies, &c. Messrs. Denman and Brierley, of York, were the architects, and Messrs. Wm. Ives and Co., of Shipley, the contractors.

SHEFFIELD.—We understand that plans have been prepared by Mr. W. J. Hale, architect, for the erection, on the site already acquired at Bole Hill, of a new chapel, with vestry and school accommodation, at an outlay of about £4000. Mr. and Mrs. S. M. Johnson have undertaken to bear the whole of the cost of this undertaking, and to present the chapel and premises to the Wesleyan Connexion free of debt. The scheme comprises a chapel to seat some 300 persons, with entrance porches and a chancel; a schoolroom for 320 children, and vestries of varying sizes, together with kitchen and other accommodation. The exterior elevations will be faced throughout with rock-faced stone, laid in narrow courses, and relieved with Ashlar dressings, the windows being carried up with traceried heads, those to the front being flanked with turrets having carved and buttressed tops. The roofs will be tiled, and the interior woodwork will be of pitch pine.

SPRINGFIELD.—The dedication of the new Church Hall at Springfield, which has been erected at a cost of about £700, exclusive of £300 for the site, took place recently.

WAKEFIELD.—New buildings have been added to the Wakefield Workhouse, which will be opened on the 19th, and comprise a new infirmary and a steam laundry. These additions were designed by Mr. Wm. Watson, of Wakefield. The infirmary will accommodate 150 patients with the requisite staff. The buildings, which are in the rear of the workhouse, consist of a central administrative block, with waiting rooms and a surgeon's room on the right, with the kitchens and pantries behind. The men's pavilion is on the left, at a distance of 42ft. from the central block, with which it is connected by a covered corridor. The women's pavilion is on the right. Substantial brick walls have been built to entirely surround the workhouse premises. The laundry block is near the eastern boundary of the site, and is 45ft. by 200ft.

Under Discussion.

EDINBURGH ARCHITECTURAL SOCIETY.

On Wednesday night, the 21st December, the annual business meeting took place; Mr. W. A. Cumming, A.R.I.B.A., the president, in the chair. After the usual reports and private business had been gone through, the following office bearers were elected:—President: Mr. A. Lorne Campbell; Vice-President: Mr. Alfred Grieg; Hon. Treasurer: Mr. John A. Matthew; Librarian: Mr. J. A. Patterson; Joint Hon. Secretaries: Mr. Percy E. Nobbs, Mr. Andrew Muir. On the following evening the supper took place and proved quite a success. Mr. A. Lorne Campbell was in the chair, and Mr. Tarbolton, in place of Mr. John Kinross, A.R.S.A., the Hon. President, who was unavoidably absent, presented the prizes. The results of the competitions are as follows:—Hon. President's prize of £10 for three designs: P. E. Nobbs; Prizes given by Mr. J. A. Morris, F.R.I.B.A., for Summer's work, first prize, £5; J. H. Rutherford; second prize, P. E. Nobbs. President's prize, £3 3s., façade design: Ramsay Tragnair. Vice-President's prize, £2 2s., wrought iron gate design: P. E. Nobbs.

WILLIAM TERRISS MEMORIAL LIFE-BOAT-HOUSE.

A writ has been issued against the Duke of Devonshire by Mr. Henry Mandy Simmons, who claims £10,000 damages in respect of alleged loss of the sea view of the Alexandra Hotel and other houses at Mostyn Terrace, on the sea front at Eastbourne. The action arises out of the erection of the William Terriss Memorial Lifeboat-House. After the assassination of William Terriss a memorial fund was started, and a considerable sum was collected for the construction of a lifeboat-house. The Duke, on being applied to, gave a site in the hollow of the Wish Tower grounds. The building, which has now been completed, is constructed of red brick, with stone ornamentation. The plans were passed by the Town Council. The new structure shuts in the grand parade from the western lawns, and it also interferes with the view from west to east; but the claim of Mr. Simmons has only reference to the alleged loss of view from his property.

THE LONDON BUILDING ACT.

At a recent meeting of the Surveyors' Institution, Mr. W. Weaver read a paper on "The London Building Act and the Official Supervision of Buildings," his object being to call attention to the unsatisfactory state of affairs at present existing owing to the dual and overlapping jurisdiction exercised by the district surveyor and the surveyor to the local vestry or district board. It was suggested, the lecturer pointed out, that the proposed district councils for London should be entrusted with the duty of seeing that buildings were erected and maintained in a sound, safe, and sanitary manner. The imposition of that duty would tend to elevate the functions of the local authority, and the work would be placed on the footing prevailing throughout the kingdom. The district surveyor and the parish surveyor would merge into one official, corresponding to the borough surveyor and engineer outside London. By the proposed change, the lecturer urged, the loss and inconvenience arising from the present dual system of supervision would be saved, and every information connected with building operations would be ascertainable at the public offices or town hall of the district. The unsatisfactory nature of the present procedure as to dangerous structures was alluded to by Mr. Weaver, who also pointed out that under existing circumstances it was nobody's duty to find out dangerous structures, the collapse of a building being the first notification of its dangerous condition.

A MONUMENT to the memory of the Empress Elizabeth of Austria is about to be erected at Mentone. The monument is to take the shape of a column 21ft. in height.

Correspondence.

THE NEW GOVERNMENT OFFICES.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Is it not nearly time that the designs for the New Government Offices in Whitehall and Parliament Street were published, seeing that the architects were appointed more than five months ago? and have you any idea as to when building operations are likely to be commenced?—Yours truly,

W. G. WILSON.

Hastings, Dec. 20th, 1898.

Enquiry Department.

SMOKY CHIMNEYS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Can you suggest a simple remedy to stop a chimney flue in a stack smoking? The case in point is this:—In a pair of newly-built cottages the chimney flues are gathered over into a centre stack; the flues smoke from the kitchen ranges, but not from the bedrooms over, which have separate and straighter flues; there is no obstruction to cause draughts, such as trees or adjoining buildings. The cottages are in the country, and I should be glad to hear of a sure and simple and reliable remedy, as the buildings are some distance from the nearest town and builder. I want, if possible, to avoid putting a "tall-boy," or other objectionable chimney-pot, on a chimney stack which is conspicuous, and upon which just the ordinary sized chimney-pots have been put. The flues in question are gathered over just above the opening, with a small bend, and they then run practically straight up.—Thanking you in anticipation, yours very truly,

T. J. P.

From your description, the reason of the kitchen chimney not acting satisfactorily is probably owing to one of the following causes, viz.: 1. Leakage from the bedroom flues into the kitchen flues, causing a check to the draught when the bedroom fires are not in use. 2. The kitchen chimney may be gathered over too quickly at the bottom, in which case this should be cut away, and the flues from range carried well up into the throat of the chimney. 3. It may also be due to the top of the chimney-pots being all of the same height, as this sometimes causes the smoke from one flue to be drawn down the other. This could easily be remedied by fixing pots on the kitchen flues a few inches higher than the others. Of course, it is assumed that your kitchen flues are of the proper area, and that your range is one which acts well, and is properly fixed.

R.I.B.A. EXAMINATIONS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Could you inform me, through the medium of the Enquiry Department, as to where I can obtain information with regard to the R.I.B.A. Exams., and oblige

"RUGBEIAN."

The Royal Institute of British Architects' "Kalendar," price 2s. 6d., to be obtained from the Secretary, R.I.B.A., 9, Conduit Street, Hanover Square, London, W., will give you full particulars, including examples of papers set at the examination, and list of books which are recommended for study.

CLEANING STONE, &c.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Please let me know through your "Enquiry Department" if there is any chemical for cleaning a stone carved reredos, and also if there is any solution for polishing granite columns.—Yours truly,

"CHURCHWORKER."

Of course, a "Churchworker" is not a church builder, or he would not ask the questions he does! Any reredos made of soft stone may be cleaned down with ordinary drags and coxcombes; and if it is Caen stone,

sandpaper may be useful. If it is of alabaster, it will require re-polishing after washing with hot water and soap. There is no solution for polishing granite; the polish is acquired by hard work only.

PRESERVING TIMBER.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I shall be much obliged if you will kindly inform me through your BUILDERS' JOURNAL if there is any solution to wash moth-eaten timber with, to prevent it getting any worse.—Yours truly,

"ANXIOUS."

We have heard of moth-eaten clothes, but never of timber so afflicted; probably "Anxious" means worm-eaten. If so, soak well in paraffin oil.

PROPORTIONS OF GOTHIC BUILDINGS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Could you kindly tell me whether anything is known of the proportions used by the Mediaeval architects in planning and designing their buildings, and if so, where I could get hold of such information?

All that I have picked up so far from books is that Norman openings are, as a rule, twice their width in height, i.e., two squares; that some Norman towers are a square. Most spires in Northamptonshire are three-fifths of the whole height of tower and spire, while some are one-half. I take it the former are Early English or Decorated, and the latter Perpendicular; that the naves of English Cathedrals are two widths in height as against the French three widths. Again, in English cathedrals the first string course is half the whole height, and the second one-third of the remainder. At Ely I believe the distances are all equal.

I have made a few observations myself, particularly in regard to plans, and hence my appetite has been whetted for accurate information.

I believe there are plenty of theories as regards the application of geometrical figures and numbers with their multiples, but surely, after all these years of study and accurate measurements since the Gothic revival began, some definite facts have been arrived at.

From the letters I have noticed in the enquiry column, I take it that the information I seek will be gladly welcomed by others.

Is any work published calculated to guide the maiden efforts of a young designer, or has he to measure and draw old buildings—measure and draw—keeping on until he deduces the principles that guided the first designers for himself, or until he gets the "feel" of the thing from sheer habit, and consequently produces designs more or less correct and proportionate, according as he has learnt and formed a habit more or less approaching perfection?

What, e.g., is the usual angle for spires, or, in other words, what proportion does the base bear to the height?

Would the base of the spire—if continued to the ground—coincide with that of the tower (a) as regards its real diameter, (b) as regards the spreading out of plinth or of buttresses?

How is the disposition of the various stories—real or apparent—as indicated by strong corners, determined on, and so on?

The answers to such questions must exist somewhere in print.—Yours truly,

R. A. DAVIS.

Your questions involve wide-reaching theories which it is impossible to deal with in these columns. The proportions of Gothic buildings depend upon much more subtle and intricate principles of design than are indicated by you, and have never, we believe, been absolutely formulated. The rule of proportion you state of height to breadth in naves of English and French cathedrals, is only generally and comparatively true, and differs widely in various examples. Nor can any rule be stated for church spires. There is a characteristic type of proportion belonging to the various styles and epochs of design, but the actual lines of the examples cannot be arrived at by any fixed rule. In the last century it was sought to establish definitely the lines of beauty and the proportion essential to beauty, not only in

Architecture, but in sculpture and drawing. Durer attempted to reduce the human form to a fixed type of perfect beauty. Hogarth, in his "Analysis of Beauty," has this same object of establishing precise rules by which certain aesthetic effects might be obtained, and the principle was even sought to be established in literature, notably by Jeremy Bentham. It is now, however, generally admitted that this reduction of forms to cyphers paralyses art rather than perfects it. If you are desiring to become an architect, we would advise you not to pursue your studies deeply in this subject. The most intimate knowledge of the theories of proportion in Gothic buildings will not enable you to design; a complete ignorance of them will not prevent you from acquiring mastery of your art, and we hold very strongly that studies of design from this precise and mathematical point of view are inimical to the growth of the creative process, and to ability in design. When you see a building which appeals to you as expressing itself with some approach to perfection, roughly analyse the proportions, and note them in conjunction with other features of the design; remembering always that the main dimensions can establish no excellence for the building apart from the treatment of the minor members of the composition. When you come to design yourself you will naturally set out your main lines in some simple geometric relation, but beyond that it is advisable to use your knowledge of Mediæval proportions rather as a test of your composition than as a guide to it. For the rest we subsume a list of works which will give you much information on this subject. In Gwilt's *Encyclopædia* (1891) you will find an exhaustive treatise by the late Edward Cresy—a reprint from his "Encyclopædia of Civil Engineering"—which embodies the whole history of the subject. Read the chapter on "Superimposition" in Ruskin's "Stones of Venice," Vol. I. You may also refer to Professor Cockerell's "Architectural Works of William of Wykeham," read before the Archaeological Institute, 1845, and to the following works:—Hon. T. L. Donaldson: "Architectural Maxims and Theories;" W. W. Lloyd: "General Theory of Proportion in Architectural Design."

ELECTRIC lighting mains for both public and private supplies up the West Hill, Highgate, have now been laid by the St. Pancras Vestry, and to the summit of Highgate Hill, and, as soon as the necessary connections are made, the current will be switched on. The top of Highgate Hill is the highest spot in the North of London to which electric lighting mains have yet been carried.

Views and Reviews.

HOUSING OF THE WORKING CLASSES.

It appears to have become a matter of course that an explanatory book should be produced upon every new piece of domestic legislation, and it is only surprising that such an explanation of the "Housing of the Working Classes Act," passed in 1890, should not have appeared earlier. Messrs. Allan's book, however, fulfils its purpose well. It is arranged in the usual form, with first a general introduction, then the Act itself and its Amending Acts, considered clause by clause, and finally, an appendix containing various forms, orders, and instructions, the whole being handily arranged and having a good index for reference.

"The Housing of the Working Classes Act, 1890, and Amending Acts, annotated and explained, together with the Statutory Forms and Instructions." By Charles E. Allan, M.A., LL.B., assisted as to the practice by Francis J. Allan, M.D., D.P.H. London: Butterworth and Co., 7, Fleet Street, E.C.: Shaw and Sons, 7, 8, and 9, Fetter Lane, E.C.

THE NEWSAGENTS' CATALOGUE, 1898.

The Annual Catalogue of the Newsagent and Bookseller's Review is the representative journal of the trades. The catalogue is a complete illustrated guide to all the best books for Christmas and the New Year, also novelties in cards, fancy stationery, &c. It is a large volume, and excellent as a reference book for the season's printed works. It includes an important section devoted to printing machinery, of the best and most up-to-date kinds. It is bound in an attractive and artistic cover, printed in colours. The published price of the annual is 1s.

THE PAGE.

The Page, which has hitherto been published as a monthly magazine, will in future appear as a quarterly. It is to be limited to 400 copies, each copy being numbered, and offered to subscribers at 10s. yearly subscription. It will be enlarged and altered in many ways, and will contain the work of the following artists:—Max Beerbohm, Will Rothenstein, Martin Shaw, Oliver Bath, W. H. Downing, S. M. Fox, Edward Gordon Craig, James Pryde, and others. A single copy of The Page (1898 series) may be obtained by sending on 1s. 2d. for a specimen to the Publisher, at the Sign of the Rose, Hackbridge, Surrey.

A BRONZE statue of the celebrated Polish poet and patriot Adam Mitskevitch was unveiled at Warsaw on the centennial anniversary of his birth.

Trade and Craft.

HENRY HOPE AND SONS, LIMITED.

The well-known business of Henry Hope, of 55, Lionel Street, Birmingham, which was established in 1818, has recently been converted into a private limited liability company, under the title of "Henry Hope and Sons, Ltd.," of which the directors are Messrs. Henry Hope (chairman), Henry Donald Hope, John Arthur Hope, and John Sutton Nettlefold. The branch of the business devoted to heating engineering will remain, as formerly, under the personal direction of the chairman. Of late, however, the firm has been developing the branches devoted to the production of metal window casements and fittings, and to stained glass and patent glass roofing, and in the new catalogue just issued special attention is given to those sections. Exhaustive details and prices are furnished, and the whole catalogue will repay perusal.

PRODUCTION OF IRON IN RUSSIA.

Ten years ago, Russia took the seventh place as an iron producing country amongst the countries of the world; last year her place was fifth, as in the meantime her production had become greater than that of Austria-Hungary or Belgium. In 1897 Russia produced 2,043,000 tons of iron, and in the last ten years tripled her production—a proportionate increase which it took Germany twelve, Great Britain twenty-two, and the United States twenty-three years to accomplish. The quality of Russian iron is inferior, but this is due to primitive methods, to the slow development of the iron manufacturing industry, and to the limited railway accommodation, which has retarded all Russian industries. The development of the industry in the southern provinces and in the Urals has been greater than elsewhere, but quite lately there have been more enterprise and activity everywhere. Between 1888 and 1893 the production of iron increased by an annual average of 99,000 tons; in 1894 the increase was 162,000; and in 1897 270,000 tons. Consequently there was a considerable decrease in the importation of pig iron, but an increase in that of manufactured iron and steel. In parts of Southern Russia ore is becoming scarce, as the deposits are being exhausted. The demands of Siberia for Ural iron are constantly increasing; Ekaterinburg is the chief market, and the Volga basin also takes large quantities from the same source.

A NEW COMBINATION BATH AND LAVATORY.

Messrs. Morrison, Ingram, and Co. Ltd., Manchester, have recently brought out a new combination bath and lavatory, which is designated "The Cottage Bramstone Patent Combination Bath and Lavatory," and has been designed for cottage property and workmen's dwellings. It is adapted for fixing in the scullery or other suitable position, and can be connected to the water supply from main, and hot water from low pressure L boiler, fixed behind the kitchen range. It may also be had for cold water only. As the lavatory is capable of being used also as sink and washtub, it will be obvious that the usual scullery sink, with plumbing and fittings thereto, may be dispensed with. The waste water from the lavatory does not pass into or through the bath. The price is moderate, and we think the patent will be greatly used and appreciated.

WALTHAM ENGINEERING COMPANY.

The Waltham Engineering Company has lately opened new showrooms at 46, York Street, Buckingham Gate, S.W., and here may be seen examples of the Art Metal Work for which the firm is justly famous. The work of the firm is largely associated with the making of art metal electric light standards, brackets, and other fittings, but it has executed a quantity of excellent designs in the wider scope for wrought iron afforded by verandahs, gates, balustrades, grilles, and other objects of the same description. Instances of the wide range and versatility of the company's work and the ample scope and opportunity it has secured for the application of its metal work designs of all kinds, are to be met with at the Bath and Cheltenham Hotel, and the "Norfolk Square," "The Golden Cross," "Shelley's," and other hotels, where the metal work throughout has been fitted up by the Waltham Engineering Company. The electric light fittings and other examples of art metal work exhibited in the Company's showrooms embrace designs derived from many dates, and suited to many styles of decoration. They include brackets, standards, and chandeliers of many patterns and various treatments of metal, and we

particularly remark the Company's designs for switches, bell pushes, wall sockets, "cut-outs," and ornamental covers, which show a great variety both in choice and treatment of the metal employed, and in the style of design selected. A special feature of the Company's work is their "armour-bright steel" fittings, of which they chiefly avail themselves in their larger pieces. In the cover plates, bell pushes, &c., they have made use of silvered, oxidised, and gilt (bright or antique) metal work in many charming designs. The field of design opened up by the demand for electric light fittings is one which offers wide opportunities to the thoughtful and skilful metal worker, because the forms required to be decorated are new, and because there is little prejudice in the public mind as to the direction which that decoration should take, or the medium of expression it should select. The coincidence of a revived appreciation for ancient metal work, and the resultant activity among art metal workers at the same date as the application of electric light to the practical needs of existence, pointed to the use of metal as a decorative medium. Metal work has now established itself as the most natural and becoming material for electric light fittings, and, as exemplified in the work of the Waltham Engineering Company, with excellent results. The Company's hammered brass, copper, and iron-work is well worth inspection, and should recommend itself to those who are in want of well designed decorative metal-work fittings.

THE Roman Catholics of Chester have protested against the erection in that city of a proposed monument to the Lancashire martyr George Marsh, who was burned for his Protestant principles in the sixteenth century.

ALL that is known of the new quick-firing gun which is being supplied to the French army is that it has a calibre of 7.5 centimetres, and is capable of discharging twenty shots a minute. The projectile, shrapnel, has a muzzle velocity of 600 metres. The cartridge weighs 6.5 kilogrammes. The recoil of the gun is greatly reduced by means of an ingenious contrivance.

KEYSTONES.

THE King's Bastion Barracks at Gibraltar have been converted into an up-to-date electricity supply station, with Siemens' machinery capable of creating sufficient current to light the whole garrison.

By the appointment of Mr. Walter Crane as Principal of the Royal College of Art at South Kensington, the Government system of art education has gained a most valuable supervisor. No better choice could have been made for a school which exists professedly to help on the art of design and to train workers in all those branches of practice which are held to be commercial.

THE historic mansion, Marble Hill, which is on the Thames bank at Twickenham, is to be sold. It was built at the expense of George II. for the Countess of Suffolk, Mistress of the Robes to Queen Caroline, after designs by the Earl of Pembroke. The grounds were laid out by Pope. "The staircase," says Cobbett in "Memorials of Twickenham," "is made entirely of finely carved mahogany, and some of the floors are of the same wood."

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BOWMORE, N.B.—For the erection of water supply works, for the Islay District Committee of Argyll County Council. The work will be carried out under the direction of Mr. J. T. D. Drummond, plumber, Thornhill, Dumfriesshire:—

GOOD-BYE TO DAMP!

NICOLAI'S PLASTRIN

is the only remedy efficaciously and permanently preventing the appearance of Dampness, Fungus, Dry-rot, Mould, &c.

PLASTRIN is unequalled for preserving iron, wood, or stonework from decay.

PLASTRIN is not subject to the effect of changes of temperature. It is flexible and elastic, and therefore will not crack or peel off.

PLASTRIN causes neither dirt nor smell, and dries very rapidly. The last coating may be painted, whitewashed, or covered with paper 24 hours after it has been applied.

PLASTRIN is obviously invaluable to Builders, Painters, Paperhangers, and allied trades.

Sample Tins, containing 1-lb., post free against remittance of 3/3.

DEATH TO DUST!

NO MORE DUSTY ROOMS!

NICOLAI'S DUST-KILLER prevents dust from rising. No more scouring of floors. It is invaluable from a sanitary point of view. Indispensable for Private Houses, Schools, Warehouses, Printing Establishments, and Public Buildings. Anyone can apply it.

Ask for Full Particulars.

CONTRACTS OPEN.

EAST BARNET SCHOOL BOARD.

TO BUILDERS.

Tenders are invited for the ERECTION of a SCHOOL, to accommodate about 860 children, at Victoria-road, New Barnet.

Plans and specification may be seen any day (except Saturday) between the hours of TWO and FIVE, on application to the Architect, Mr. W. PYWELL, 40, Great James-street, Bedford-row, W.C., of whom bills of quantities may be obtained on payment of a fee of £2 2s., which will be returned in any case in which a bona-fide Tender is made.

Tenders on printed forms, and endorsed "Tender for Victoria-road School," must be addressed to the Chair-man of the Board, and sent to me by NOON of THUES-DAY, JANUARY 12th, 1899.

The acceptance of a Tender will be subject to the approval of the Education Department. A bond in the sum of £2000 will be required for the due performance of the work.

ARTHUR WILSHIRE,

Lancaster-road,
New Barnet,
Clerk of the Board.

CORDELOVA

The Embossed Decoration for

**Walls,
Ceilings,
Friezes,
Dados,
Borders,**

Design No. 191: 1s. 9d. per Panel.

DESIGNS FOR WALLS in all styles, viz.: Reproduction of Old Leathers; Louis XIV., Louis XV., Louis XVI., Elizabethan, &c., &c.

DESIGNS FOR CEILINGS in Low and High Relief, comprising Elizabethan, Louis XIV., Rococo, Modelled Plaster Effects, &c., &c.

DESIGNS FOR FRIEZES from 3in. to 30in. deep, in High Relief—all the effect of the best modelled plaster at a fraction of the cost.

DESIGNS FOR DADOS, including Arabesque, Gothic, and other designs; also the Com-pany's Speciality reproductions of Panelled Oak in great variety

MEASURES BROTHERS. LTD. LONDON.

SIEMENS-MARTIN AND BESSEMER STEEL JOISTS.

MEASURES' JOISTS ARE THE BEST AND CHEAPEST IN THE MARKET.

Have now in their Town Stock 6500 tons of STEEL JOISTS, 3in. to 20in. deep; also 1000 Tons of Iron Joists, Channels, Tees, Angles, Plates, &c. Riveted Girders, Fireproof Floors, Stanchions, Columns, Chequered Plates, Rails, Bolts, &c.

SECTION SHEETS AND ESTIMATES ON APPLICATION.

Prompt Delivery from Stock. Steel Joists specially adapted for Pit Props and Colliery Work.

CHIPPING NORTON MAIN DRAINAGE.

The Town Council of the Borough of Chipping Norton are prepared by the advice of their Engineer to receive TENDERS for CERTAIN WORKS of MAIN DRAINAGE, partly within and partly without the Borough of Chipping Norton.

The plans, specifications form of Tender, and form of proposed contract, can be inspected, and bill of quantities obtained upon application at the offices of Mr. NICHOLSON LAILEY, F.G.S. Assoc. Mem. Inst. C.E. 16, Great George-street, Westminster, on and after JANUARY 16th, 1899, until JANUARY, 30th, 1899, between the hours of TEN o'clock a.m. and FOUR o'clock p.m. (Saturdays excepted).

A copy of all documents are deposited with the Borough Surveyor, Chipping Norton, where they can be seen at similar hours in the dates before-named.

The Engineer will attend (or his Chief Assistant) at Chipping Norton, upon a date to be subsequently named, in order that the nature and extent of the undertaking can be explained, and Contractors will be advised thereon.

Tenders endorsed "Chipping Norton Main Drainage," must be delivered at my offices at SIX o'clock p.m. on JANUARY 31st, 1899.

The Town Council do not pledge themselves to accept the lowest or any Tenders, and contractors Tendering must do so at their own sole cost and expense, as the Local Government Board have not yet given their sanction to the works.

By order,
THOS. MACE,
Solicitor,
Town Clerk.

Chipping Norton,
December 19th, 1898.

COUNTY of SOUTHAMPTON.

BREAMORE BRIDGE.

RECONSTRUCTION.

CONTRACT No. 1. SUPERSTRUCTURE.
TO BRIDGE CONTRACTORS.

Persons desirous of TENDERING for the CONSTRUCTION and ERECTION of the SUPERSTRUCTURE of Breamore Bridge (over the River Avon),

consisting of two pairs of 45ft. Trellis Girders, together with Pender Plates, Steel Trough Decking, &c., may obtain copies of plan and specification, &c., and all other information, at the office of Mr. W. J. TAYLOR, County Surveyor, The Castle, Winchester, on and after MONDAY, JANUARY 9th next, between the hours of NINE a.m. and FIVE p.m., SATURDAYS, NINE a.m. and ONE p.m.

A deposit of Two Guineas will be required for plan and specification, and will be refunded on receipt of a bona-fide Tender and the return of the plan and specification.

Tenders, strictly in accordance with the forms supplied by the County Surveyor, to be delivered to me on or before SATURDAY, JANUARY 23th next.

The County Council do not bind themselves to accept the lowest or any Tender.

H. BARBER,
Clerk of the County Council.

The Castle, Winchester,
December 25th, 1898.

CARBOLINEUM AVENARIUS

(REGISTERED).

PATENT WOOD PRESERVATIVE.

CARBOLINEUM AVENARIUS, the well-known Wood Preservative, enters the wood by its own action, and does not require a costly plant and machinery like other Wood Preservatives.

CARBOLINEUM AVENARIUS entirely prevents dampness in brick and stone walls, also wet and dry rot in timber above or below ground, and is used by all the leading Railway Companies, and by Builders, Brewers, Contractors, Estate Agents, Mine Owners, &c., &c., in the United Kingdom.

CARBOLINEUM AVENARIUS, the most successful preservative and antiseptic for Wood Paving Blocks. Used in the Metropolis and many Provincial Towns. Superior to Creosote or Hard Wood.

For further Particulars and Testimonials, apply

PETERS, BARTSCH & CO., DERBY, and 68, Queen St., Cheapside, London.

To All Owners and Users of Steam Boilers.

PATENT 22,561, ACCEPTED FEBRUARY 9TH, 1895.

ABSOLUTE PREVENTION OF BOILER INCRUSTATION.

By addition of Chrome Salts to the Feed Water the formation or deposit of all Incrustation is thoroughly prevented.

For Cost of Licenses and Full Particulars, apply

PETERS, BARTSCH & CO., DERBY, and 68, Queen Street, London.

INDESTRUCTIBLE COMBINATION WASHERS,

FOR FLANGE JOINTS OF STEAM AND WATER PIPES.

Tested up to 2300lb. Pressure.

These Washers consist of Rings of Soft Metal, grooved outside, and holding in the groove packing material such as Asbestos, Rubber, Hemp, &c., &c. The soft metal, in conjunction with the packing included, will accommodate itself readily to any unevenness in unplaned flanges, and make a perfect and durable joint. It is impossible, owing to their construction, to blow them out under any pressure whatever.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

DESIGN AND DETAIL OF DOMESTIC BUILDING.

BY JOHN E. NEWBERRY, A.R.I.B.A.

IV.

THE subject of these notes is the design of a house with stone mullioned windows and dressings. It may be presumed that when such a monumental material is to be used the building will be of more pretension and importance than any that have hitherto been considered in this series.

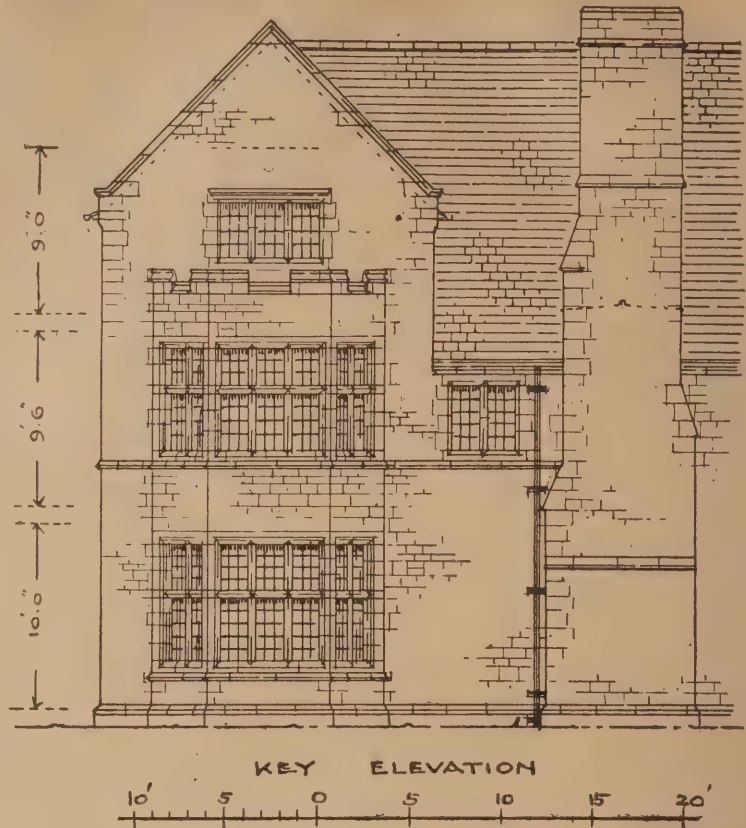

The successful treatment of such a house depends in a great measure upon the size and proportion of the windows and the detail of the stonework. Failures are often owing to an inexperienced designer using more stone than is appropriate or necessary, particularly in the width of mullions and the depths of lintels and sills. Big windows, filled in with single sheets of glass, are also a frequent source of failure.

The portion of a house shown upon the key elevation, treated in a simple late Gothic manner, is of an ordinary type and with no pretence to any originality of design. It must be borne in mind that the object of these notes is an endeavour to help those students of Architecture who have not had the advantages of studying accepted methods in a good office. The simplest things puzzle a beginner when he attempts to evolve a design and the relative or usual sizes of the different parts is often one of the greatest difficulties he has to contend with.

MATERIALS.—In a stone country, no material can be more suitable than the native stone for the general external facing of the walls. The portion of the house shown on the accompanying details is intended to be faced with rubble stone in random courses, varying from 4in. to 10in. deep; the surface would be roughly dressed with a hammer. Such walls should not be less than 20in. thick for the main structure.

The dressed stonework might be finished externally with a chiselled face, and set in finely ground mortar, with the beds and joints $\frac{3}{16}$ in. thick. Rubbed stonework, with fine joints, has a mechanical appearance when used externally, and does not harmonize well with the irregularities of a rubble wall, but, internally, the stonework might be rubbed to give a more finished effect.

If brick is used for the general facing, care must be taken to design the strings, lintels, sills, &c., so that they may work in with the brick courses. Attention must also be given to the outline of stone quoins where they abut against brick facing. The quoins look best when they are neither too large nor too regular,

and it is worth while to make careful studies to show the effect aimed at.

ROOFS.—The pitch of the roofs may generally be about 45deg., although with gables it is preferable to make them a little steeper and so avoid a right angle. But much depends upon the roofing material to be employed:—47½deg. or 50deg. are useful angles to work one's roofs to; the late Mr. Street frequently made use of an angle as steep as 53deg.

GABLES.—The gable on the key elevation is terminated with a simple coping of a slightly hollow section. The wall immediately under the coping might be 12in. thick if of stone, or 13½in. if of brick, and the bottom of the coping should be kept fairly close to the intersection of the gable wall with the roof:—3in. of wall surface is probably as much as should be exposed above the tiles or slates. The horizontal joint indicated is perhaps an unusual form, but it has the advantage of being a weather joint, and has been found to work well in practice. Each joint is intended to be secured with two slate dowels in the bed.

PARAPETS.—The parapet coping is intended to surmount an ashlar wall 7in. thick. A point to bear in mind when designing copings of this form is to keep the upper member well forward, so as to allow for the foreshortening effect when seen from below.

EAVES.—An appropriate method of treating the eaves is to finish the walls with a projecting stone eaves course, splayed or moulded, with shaped sprocket pieces spiked to the rafters, and the half round eaves gutter screwed to brackets fixed to these sprockets.

CHIMNEYS.—The external walls of chimney-stacks should not be less than 9in. thick in brick or 7in. in ashlar stone, in order to prevent rain soaking through and cooling the flue. Generally speaking, the larger a chimney-stack, the more it adds dignity to the building. Flues should, therefore, be grouped together as much as possible for economy as well as effect, and ventilation flues from the principal rooms may be provided with advantage. The top of all chimney-stacks should be carried to a higher level than the nearest ridge to prevent down draught. It is often necessary to introduce a small pitched roof behind a chimney-stack when it is against an outside wall, to reduce the apparent height. Such a roof is often useful in providing a fireplace in an attic room.

WINDOWS.—The main point to remember in

designing stone mullioned windows is to keep them in scale with the building. However large the window, I would not make each individual light more than 18in. to 21in. in width, or 3ft. to 3ft. 6in. in height. Lofty windows should be divided horizontally by transoms, and the lights may be made to diminish vertically; care must be taken to keep the lowest transom quite 6ft. from the floor, so as to be above the level of the eye. The mullions and transoms are usually 4in. to 5in. wide, 8in. to 9in. deep, and they have a "wraggle" or groove cut in them to receive the lead glazing. Those lights in which casements are to be fixed require a rebate for the metal frame, and care should be taken to keep the glazing in the casements in the same plane as the fixed lights.

The upper lights are best provided with casements hung to the transom to fall inwards, with a cord and gunmetal spring catch. The lower casements should be hung at the side to open outwards. The mullions are shown to be moulded, but a simpler treatment is to chamfer or hollow them, though if the latter it should be very slight. If the windows are to be glazed with single sheets of glass it will generally either be necessary to provide casements for every light, or fixed metal frames to those lights which are not intended to be opened. Another method is to rebate the stone and secure the glass with oak fillets, secured with brass screws to lead plugs let into the stone. The enlarged detail shows a "double order" window, as the mullions and transoms are slightly set back from the wall face, and enclosed in a frame consisting of a small moulding on the jambs and head. If the window consists of a number of lights, say five or more, it becomes necessary to introduce wide mullions, on which the extra order is carried round. When a drip moulding is placed over a window, it should always be worked on the head. A common mistake is to make heads and sills too long and too deep; they should only just be long enough to get a good bearing at either end, and need seldom exceed 9in. in depth. If they tail far into the wall, the slightest settlement is sure to crack them.

BAY WINDOWS.—I would refer my readers to Mr. Paul Waterhouse's exhaustive paper on this subject, which has been lately published in the BUILDERS' JOURNAL. When three sides of a canted bay form part of a regular octagon, the effect is good in some situations, but one often requires the central opening to be wider

than the canted sides. In such cases there is no need to restrict the angle to 45 deg. In the example given the angle is somewhat steeper. A mullioned bay in an important position should always have the central part divided into an uneven number of lights, say three or five, as a central mullion is awkward and should be avoided. The side lights may be a little smaller than those in the centre, but the difference should not be very perceptible. In a large room, a bay generally looks best when its ceiling is divided from the main ceiling by a lintel or arch. If the room is finished with a panelled plaster ceiling the arch is useful in keeping it a regular shape.

The window back and returns on either side of the bay are shown to be plastered, but if funds would allow they would be better panelled in wood. In designing the junction between stonework and plaster, the effect when the room is papered should be considered.

GLAZING.—My remarks on lead glazing in the first article (see the BUILDERS' JOURNAL, March 23rd, 1898) will equally apply to stone-mullioned windows. The saddle bars may be a little larger with advantage on the outside—say, $\frac{1}{2}$ in. by $\frac{1}{2}$ in. If it is desired to enrich the upper lights, a good geometrical pattern looks well; or, if colour is to be used, shields, wreaths, or even figures, in stained glass, can be worked into the clear glass squares with good effect. It is well to remember that all artistic work should be of the best only, if this cannot be had it is far preferable to omit all carving, stained glass, etc., altogether; nothing betrays vulgarity of taste more than bad sculpture, or cheap coloured glass windows.

ENTRANCE.—One advantage of the manner of building which we are discussing is its adaptability. Anything, from a pointed arched doorway to a classically treated entrance with columns or pilasters, might be made suitable for such a dwelling. A somewhat low and wide opening would be most appropriate, with delicately detailed stonework, and oak panelled doors with beaten metal hinges.

RAIN WATER PIPES.—The down pipes will probably look best if of a circular section, as this will admit of the stone strings being carried around them; $3\frac{1}{2}$ in. to 4 in. in diameter is quite large enough.

SOME artesian boring operations carried out near Peterborough Station, for the Great Northern Railway Company, by Messrs. Le Grand and Sutcliffe, of Bunhill Row, have proved very successful. At a depth of 132 ft. a spring has been struck, which flows at the rate of 300,000 gallons per day.

It is stated that the Board of Trade is contemplating the promotion of an Act of Parliament to make the use of automatic couplers compulsory on the railways of the United Kingdom. The possibility of such legislation is a very serious matter for our railway companies, involving, as it may, in the estimate of one general manager, an expenditure of no less than £7,000,000 in refitting the existing rolling-stock, besides having a most important bearing upon the safety both of employes and passengers.

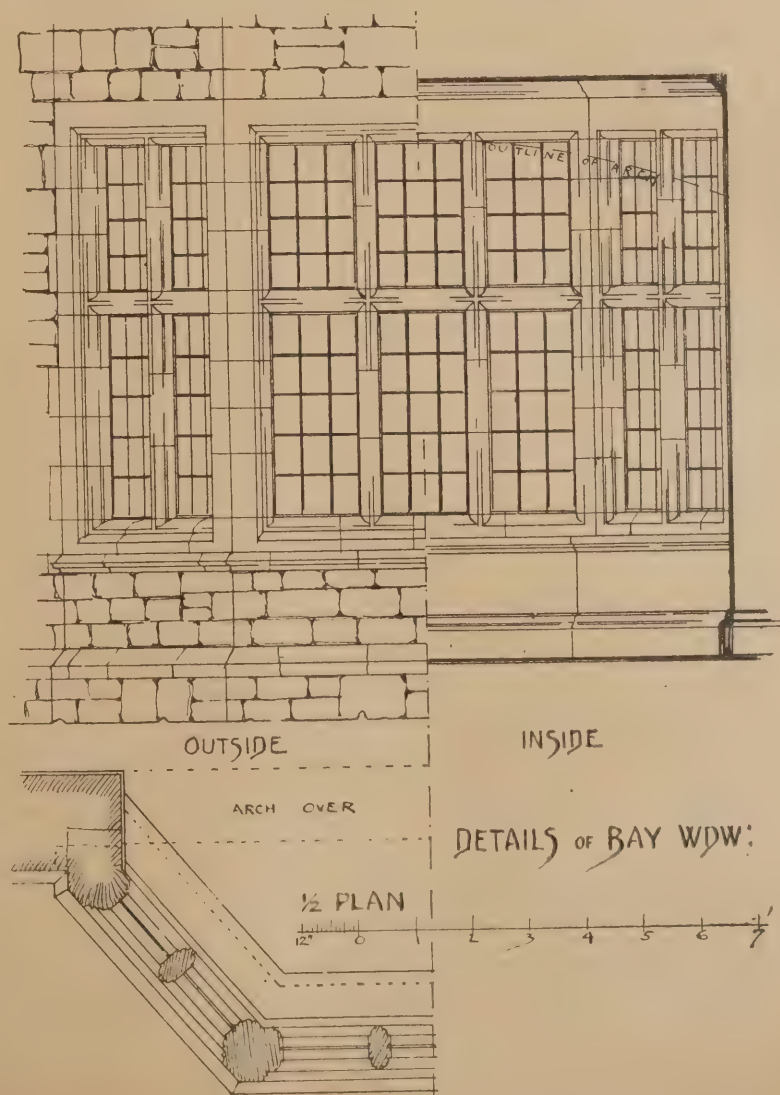

A YEAR'S BUILDING IN THE NORTH.

THE prosperity of a city may be fairly gauged by the condition of its building trade. So many industries are centred in Leeds that there is scarcely any rise or any depression which is not reflected here without delay. "It has been almost a phenomenal year for us," said one of the leading contractors, "and there has been so much building going on that the workmen have practically not had an idle day." This verdict includes nearly every kind of building operation—factories, banks, hotels, shops, offices, places of worship, places of amusement, and private dwellings. "General good trade," says the same authority, "is at once the cause and the explanation." A short comparative statement for three years past shows at a glance the

marked progress and development of the year just closed. A separate record is kept of the number of houses erected, and every other kind of permanent structure is classified "Miscellaneous" in the statistics so far available:

	Houses erected.	Average per working day.	Miscellaneous buildings.
1898	2400	8	1289
1897	1850	6 1-6	1053
1896	1681	5 1-2	918

A strike of twenty-two weeks' duration among the bricklayers terminated with a dearly-acquired advance of a halfpenny per hour, and a farthing to the labourers, with another farthing at the expiration of six months. The year has passed without any further conflict between employers and employed. There has consequently been a considerable demand for men right up to the autumn, and the better class of artisan has been able to obtain even more than the standard rate of wages. In one or two instances builders had to refuse contracts because they could not get either the men or the material to proceed with the contracts in a satisfactory fashion. Wages have been higher than for some seasons past. Since May last the masons, joiners, and plumbers have all been raised a halfpenny per hour. A notice, which expires next May, has been received from the bricklayers asking for an advance of a penny per hour. On the other hand, a counter notice has been served on the men by the employers suggesting a reduction of a halfpenny per hour, and the two proposals will no doubt be considered together. Any increase in the present rate of wages must, however, have the effect of checking enterprise, particularly in the erection of villa houses and cottage property. Cottage houses now cost so much that even the speculative builder can hardly prosper on existing rents. Increased rents seem inevitable in view of the fact that £40 to £50 more has been recently paid for cottages; and, in spite of this,

builders say that, owing to the enhanced cost of labour and material, they have reaped less profit.

Among the more important buildings now in course of erection may be cited the Leeds Empire Palace, and the long rows of shops which are being erected by the Leeds Estate Company in connection with the Wood Street and Cheapside improvements, the Hotel Metropole in King Street, large insurance offices on the site of the old Post Office, new premises for the Yorkshire Banking Company opposite to the Exchange in Boar Lane, a new arcade off Land's Lane and Upperhead Row, a large clothing factory in Park Lane, ice stores in York Street, a boot and shoe factory in the rapidly developing Harehills district, near to the new clothing factory of Messrs. Albrecht, and the Pupil Teachers' Training College in Great George Street. A cheapening of the price of material has been looked for in vain. Bricks were a little more plentiful and easier to obtain on the old terms. Stone has throughout the year been in great demand. None of the quarry proprietors in the district could complain of lack of orders. They have had more than they could fulfil, and, owing to the impossibility in some cases of getting stone of dimensions ordered from Yorkshire quarries, architects, contractors, and proprietors have lately been obliged to seek what they required much further afield. Timber has been kept up largely through the high freights from America and the Baltic, and lead is considerably dearer.

BRADFORD.

The year has been a fairly busy and active one. Dwelling-houses show the biggest increase, and the large number of these that have been erected forms one of the most prominent features of the trade of the year. The plans for dwelling-houses total 1200, as compared with 769 for 1897. The localities where the activity is most noticeable are Bradford Moor, Gillington, East Bowling, and the Horton Grange Estate. The plans for warehouses and mills number thirty-two, as against twenty-six for the previous year. Buildings of the shop and house class show an improvement not only in numbers but in size. The only branch of the trade which has not shared in the general prosperity is the building of public-houses, and in this no work of any significance has been carried out.

HALIFAX.

The building trade has perhaps been more brisk than in any previous years, and the supply of workmen has not always been equal to the demand. The extensive new Workhouse Infirmary still affords employment to men engaged in different branches of the trade. A new court house and police station are in course of erection, and the contracts for a large new public hall have recently been let. Taking advantage of the briskness of trade the operative joiners have asked for an advance of 3d. per hour in their wages.

HUDDERSFIELD.

Although not many works of an extensive character have been carried out during the year, the building trades generally have been brisk, and the demand for workmen has been greater than the supply. This and the trades' union restrictions and high wages have led to the employment of more machinery in quarries and masons' yards and in joiners' workshops, while the use of terra-cotta and ornamental and other glazed ware for walls, and fibrous plaster in sheets, and wood mouldings for ceilings is extending rapidly. The prices of building materials have gone up, Crosland Hill stone to the extent of at least 10 per cent. The building of the Victoria Tower at Castle Hill, the completion of the Sanatorium, the extension of Huddersfield Technical College, the new police station, and the doubling of the size of the Corporation's electric lighting supply station are the chief big works of the year. The opening of the Master Builders' Exchange on the 1st September is a feature of interest. It has over 300 members, and is working very successfully.

HULL.

Although exact details are not available as to the number of building plans passed during the year by the Hull authorities, it is stated by the Building Surveyor that busy as the trade was in 1897, the operations for that year have been far exceeded during 1898. Building, so far as residential property is concerned, has been especially active in the western and northern suburbs, where several hundreds of houses are now in course of construction. The whole appearance of the Hessle Road has been changed by the long lines of shops built during the year on what were previously open fields. As regards commercial buildings, several very expensive warehouses have been built mostly on the sites of older constructions. Flour mills, some of them of gigantic size, are springing up along the banks of the River Hull, this being a favourite site for the mills from the fact that craft can go alongside the mills and be discharged direct into the buildings.

MANCHESTER.

The dispute among the stonemasons in the earlier half of the year greatly affected building operations. Many large contracts were brought to a standstill after the foundations had been put in, and it is only recently that in some of these cases the erection of the stone superstructures has begun. Where the question of stone was at rest there was exceptional briskness in the building trade throughout the year. Whatever may be said as to the failure of the Ship Canal to serve the purposes of the shareholders, its influence has brought a great increase to the industrial population, and along with that have necessarily come great schemes of construction for manufacturing, storage, handling, and residential purposes. Railway companies and the sanitary authorities have swept away many old dwellings, and cottages, barrack buildings, and model lodging-houses are being prepared in fresh places. The speculative builder has been busy, and thousands of houses have been put up in the outskirts. Quite a transformation is going on in the heart of the city in the erection of the Great Northern Goods Station, the Midland Railway Hotel (to cost £1,000,000), and the rebuilding of warehouses, shops, and business premises. A municipal technical school and a University Hall at Owen's College, to cost £50,000, are among public works in progress.

SHEFFIELD.

Builders and contractors were never busier than they have been during the past twelve months. The greatest development has been on the Ecclesall and Abbeydale side of the city. A large estate on the Ecclesall Road, adjoining the General Cemetery, is fast being covered, and not only is the Abbeydale district being built up, but Millhouses, only a few years ago a rural district, altogether cut off from the town, is now joined to the city. During the year the work of completing High Street has proceeded. Mr. John Walsh is building vast piles of premises on either side of the street, and these are quickly approaching completion; the Angel Hotel has been rebuilt, and the Star Hotel and King's Head are being replaced by new structures. Another bit of the old street will shortly disappear, and in its stead will be erected a grand pile of buildings, a portion of which is to be occupied as a bank. The Corporation have had in hand the new baths for Brightside, and they have built two destructors.

The Whitechapel Board of Works has just decided to light its district by electricity. To carry out the work the engineer estimates that a capital expenditure of £60,000 will be required during the first two years, and it is anticipated that by the end of 1899 the principal streets will be served by the new illuminant. The engineer says that the works can be made self-supporting in at most three years. A sliding scale of charges will be drawn up, but it is estimated that the light can be profitably supplied at less than 42d. per unit to consumers regularly using their lamps after eight p.m.

CONDITIONS WHICH RENDER HOUSES UNHEALTHY.*

By JAS. I. LITTLE,

Late County Sanitary Inspector, Renfrewshire.

(Continued from page clxxiii.)

CLAYEY and alluvial soils are very retentive of damp, and are always liable to be cold, and a house built over such soils is never healthy, as there is always an upward current of damp ground air into the house, and there is always a tendency to dampness. In fact, a district with a clay subsoil is more liable to fogs, and therefore more unhealthy than the dryer situations. In one of the reports by the Registrar General for Scotland, when referring to an enquiry as to the causes of consumption, he said:—"It was found that the towns, villages, hamlets, and houses which were situated at or near undrained localities, or were on heavy impermeable soils, or on low-lying ground, and whose sites were consequently kept damp, had a very much larger number and proportion of cases of consumption than towns, villages, hamlets, or houses which were situated on dry or rocky ground, or on light porous soils, where the redundant moisture easily escaped." This tendency to phthisis, by people living on damp soils, is more observable when the nature of their employment necessitates their being confined in houses, offices, or workrooms during the day.

We may take it, therefore, that all soils are more or less porous and damp, and the interior of the building will, unless special precautions are taken, be liable to be affected by the exhalations rising up from the ground on which they are built, as the warmth of the houses when occupied has a tendency to assist the upward passage of damp or ground air. All sites should be prepared and means of protection adopted which will render the house safe from inroads of damp or ground air. Unfortunately this is seldom properly performed, and when anything is done, it is carried out in such a prefatory manner generally that the house benefits very little. The Public Health Act and the Burgh Police Act enact that it is unlawful to erect a new building on any ground which has been filled up with any decomposing matter until such has been removed. It is very important to have this power, but how is it possible to know, or to prove, that decomposing matter has been buried in the ground on which thousands of houses are erected every year? It is only in very rare instances that these powers can be taken advantage of, with the result that many houses are erected every year over ground containing very objectionable matter. There are also provisions in various local acts and by-laws providing for the draining and concreting or asphaltting of the sites for new buildings, but even then the builder can, and does, deceive the authorities.

If a house is to be healthy, it must be thoroughly protected from ground air, as the exhalations arising from damp and undrained soils are poisonous. It is not sufficient to merely remove the surface soil and lay a thin layer of asphalt, which may or may not cover all the ground surface. Damp courses in walls are now considered imperative in all new buildings. These, however, are often mere imitations, and the substances used not capable of resisting the capillary attraction of the water in the walls. The material is also often carelessly laid, not properly jointed, and not extending through the wall. In a word, many of the substances used are a fraud. Every damp course should be bedded with a good layer of cement mortar so as to ensure no interstices being left.

If the site is not drained to lower the subsoil water and the surface covered with an impermeable material the house cannot be healthy.

* A paper read before the Glasgow and West of Scotland Technical College Architectural Craftsman's Society.

A wet hill slope should always be avoided as a site for a building; but if it must be used the site and the ground above it should be thoroughly drained, and on no account should the house be built on a terrace cut out of the hill. The experience of the 42nd and 79th regiments at Balaclava is a good instance to explain this. The huts of the 79th were placed on terraces cut out of the hill, while the huts of the 42nd were placed on projecting terraces. The result was the 79th suffered severely from fever, while the 42nd had none.

A hill overhanging a house also causes a stagnation of air around it.

DESIGN.

On the architecture lies the responsibility of the unhealthy condition of many of our houses. Unhealthy conditions are generally associated with defective sanitary appliances, but unless buildings are so planned and constructed that every room and corner be efficiently ventilated, and that without a sense of draught, the house cannot be healthy. It may be said, with the late E. W. Godwin, "Science and Art must walk hand-in-hand if life is to be worth living. Beauty without health is incomplete. Health can never be perfect for you so long as your eye is troubled with ugliness." Professor Gourlay, in one of his lectures, described Architecture as a constructive art, and as the art of giving to a building all the perfection which can be given to it; and this perfection, he said, is attained when a building is perfectly suitable, perfectly stable, and perfectly beautiful. These are just the points required to make a house healthy, and if these were honestly kept in view by architects and craftsmen in the planning and construction of dwelling-houses, instead of endeavouring, as is often the case, to erect the greatest number of dwellings on the least possible space, and at the least possible cost, the conditions which render houses unhealthy would be less frequently met with. A writer in one of our evening papers lately, in referring to the working-class houses, said:—"They (the houses) need improvement, and some of them that are being put up will be anything but comfortable or useful. If the builders or designers were of the working-class, I am quite sure they would use their brains towards making the houses different from what is put up. They are built with shoddy attempts at grandeur—the size of the houses does not permit of style—and, in the attempt, use, healthiness, and comfort are sacrificed for silly show." The present-day designers of buildings unfortunately study the law on the subject more than the health of the community, and the closer they can sail to the wind the more satisfied are they with their handiwork. Their responsibility ends with the completion of the buildings; they leave the health of the occupiers of the houses in the hands of the sanitary official—that is what he is paid for, let him do his duty, and the general health of the community will be improved. Mistaken idea! The laws relating to the requirements for buildings will never be perfect until our engineers, our architects, and our craftsmen become impressed with the knowledge that on their shoulders lies the primary responsibility for the health of the people. There is no Act of Parliament or Building Regulation but can be evaded in one way or

other, and until the important relation in which Architecture stands to sanitation is thoroughly recognised, the conditions which render houses unhealthy will continue to exist. A relation there is, and that this is a very strong one, could be very easily proved if closely followed up. The relation of the construction of our houses to the health of the occupants seems to have been entirely lost sight of in the designing of the majority of our old buildings, but the idea that some actual relation between beautiful and artistic surroundings and health did exist must have been present in the minds even of ancient writers, as in Plato's "Republic" we find the following paragraph:—"Let our artists be those who are gifted to discern the true nature of beauty and grace; then will our youth dwell in the land of health, amid fair sights and sounds; and beauty, the effluence of fair words, will visit the eye and the ear, like a beautiful breeze from a purer region, and insensibly draw the soul, even in childhood, into harmony with the beauty of reason." Thus the great philosopher held that the productions of art, acting through the eye on the mind, exercise a distinct influence on bodily health.

That, however, did not deter the late Sir Edwin Chadwick from viewing the idea of any relation between Architecture and hygiene with disfavour. He seemed to think that art and hygiene were not only unconnected, but even in some respects incompatible. Other men of standing in the scientific world, however, who have given much study to this question, have shown very clearly that unless art is combined with science a house will never have the cheering influence that is required in our homes, if the health of the community is to be improved. The chief of these was Sir B. W. Richardson, who has occupied the foremost rank of sanitary authorities, and, who, during his life, thoroughly considered this aspect of sanitary science. In a lecture he delivered on the relation of Architecture to Hygiene, he began by showing that much prejudice has been excited against some of the best sanitary inventions and labours, because leading sanitarians have failed to consider artistic construction as part of sanitary construction; their whole minds have been absorbed in the useful, and they have permitted all that is ornamental to pass by, as if good taste were disconnected from sanitation. He argued that this was a great mistake; that ugliness was an offence to good health, and that beauty was an aid to the best health. He showed that when mind and body are enfeebled by bad health, the introduction of disagreeable objects into the sick room or ward is painful and injurious to the occupants, whilst the presence of beautiful flowers, pictures, and designs is curative in its effects—a kind of mental tonic, which gives tone also to the body. This thought led him to the consideration of the best forms for hospital wards, having regard to the effect on the eye, and through the eye on the mental and bodily health.

(To be continued.)

The engineering and boilermaking works, known as Tay Foundry, situated in Maryfield, Dundee, has been sold to Mr. William Mair, Crieff.

Surveying and Sanitary Notes.

It appears from a report presented by the engineer to the Rural District Council that the £10,000 borrowed for carrying out the Northend Drainage Scheme, at Gloucester, had been expended, and that another £5000 or £6000 would be necessary to complete it.

An inquiry into the proposed scheme for the drainage of the Lea and Roding Valleys was recently held at the Urban District Council Office by Major-General H. J. Crozier. The object was to ascertain the feeling of the Urban Council as to the appointment of a Board of Management to carry out a scheme suggested by the Lea Conservancy.

The experts appointed by the Rivers Committee of the Manchester Corporation to advise them upon the treatment of the sewage at their outfall works at Davey Hulme, have made a preliminary report to the committee, recommending the bacteriological system for the treatment of the Manchester sewage. The experts were Mr. Baldwin Latham, C.E., of London, Dr. Frankland, of London, and Mr. W. H. Perkins.

At an examination in practical sanitary science held at Manchester on December 16 and 17, 1898, six candidates presented themselves. The following candidate was granted a certificate in practical sanitary science:—William John Ball, 17, Wellfield Street, Warrington. At an examination for inspectors of nuisances, held at Manchester on December 16 and 17, 121 candidates presented themselves. Fifty-six candidates were certified, as regards their sanitary knowledge, competent to discharge the duties of inspectors of nuisances.

The resolution of the London County Council of November 29th, according to which all clearances under the Housing of the Working Classes Act, 1890, which involve rehousing are to be done at the sole cost of the Council, has not been long in bearing fruit. The more impecunious vestries are already looking out for areas to be cleared, and for sites to be built upon, at the expense of the ratepayers at large, and among them the parish of St. George-the-Martyr is well to the fore. Already a special report on unhealthy areas and on vacant sites has been drawn up, and the vestry is being urged, without loss of time, to make representations to the County Council on the subject. We do not, however, gather that, according to the resolutions, the Council is in any way bound to rehouse in the same parish as that in which the clearance is made, and it is much to be hoped that, as the Council is now committed to building, it will take care to obtain sites for the purpose on something like a general plan, and one which shall lessen instead of merely perpetuating the present overcrowding. We hope that before the Council spends a penny on new sites for workmen's dwellings, it will draw up a general plan of action, so that the excess of population shall be removed from the central parishes, and located where the people can lead more healthy lives.

Property and Land Sales.

PERIODICAL SALES.
ESTABLISHED 1843.
MESSRS. H. E. FOSTER & CRANFIELD
(successors to Marsh, Miller, and Co.) conduct
PERIODICAL SALES of
REVERSIONS (Absolute and Contingent),
LIFE INTERESTS and ANNUITIES,
LIFE POLICIES,
Shares and Debentures,
Mortgage Debts and Bonds, and
Kindred Interests,
on the FIRST and THIRD THURSDAYS in each
month throughout the year, at the MART, Tokenhouse-
yard, E.C. Remaining date for 1898 :—
December 15th.

The following are the appointments fixed for 1899 :—

January 5th	May 4th	September 7th
January 19th	May 18th	September 21st
February 2nd	June 1st	October 5th
February 16th	June 15th	October 19th
March 2nd	July 6th	November 2nd
March 16th	July 20th	November 16th
April 6th	August 3rd	December 7th
April 20th	August 17th	December 21st

Offices, 6, Poultry, London, E.C. Telephone No. 999 Bank.

SURREY.—Choice BUILDING ESTATE.
—In a charming district, two miles from Horley station (L.B. and S.C. Rly.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church.
FOR SALE, a compact and valuable FREEHOLD PROPERTY of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Pretty timbered. Gas and water mains along the frontage. Would be divided.
Plans and full particulars of the owner's agents, Messrs. GREEN and SIMES, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W.; or Mr. W. M. LEACH, Auctioneer and Estate Agent, Crawley, Sussex.

FAIRMILE PARK, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

MESSRS. DRIVER and CO. have received instructions to offer to AUCTION at the MART, Tokenhouse-yard, Lothbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern."
Particulars and plans, when ready, can be obtained of CHARLES JUPP, Esq., Solicitor, 48, Lime-street, E.C.; and of Messrs. DRIVER and Co., 23, Pall Mall, S.W.

By order of Trustees.—Preliminary Advertisement.—Freehold Building Estate, Streatham, near West Norwood Railway Station.

MESSRS. FIELD and SONS, and Messrs. WALFORD and WILSHIN, who are jointly concerned, will SELL by AUCTION, at the MART, at an early date, a valuable FREEHOLD BUILDING ESTATE, known as High View Park, comprising 16a. 1r. 10p., lying immediately at the rear of and with approach from Leigham Court-road; also a contiguous Freehold Building Site of 2a. and 5p. in a new road intended to connect Canterbury-grove with Thurlby-road.
Particulars and plan, in due course, of Messrs. KINGSFORD, DORMAN, and Co., Solicitors, 23, Essex-street, Strand; of Messrs. WALFORD and WILSHIN, Auctioneers, Anerley, S.E.; and of Messrs. FIELD and SONS, as above.

By order of the Executors of Miss Susanna Roycroft.—Camberwell.—Leasehold Ground Rents.

MESSRS. FIELD and SONS will SELL by AUCTION, at the MART, on WEDNESDAY, JANUARY 18th, at TWO o'clock, in two lots, improved LEASEHOLD GROUND RENTS, amounting to £45 per annum, arising from and amply secured upon three shops and six dwelling-houses, being Nos. 202, 204, and 206, Camberwell-road, and Nos. 34, 36, 38, 40, 42, and 44, Mansion-street, adjacent, of the rack rental value of about £200 per annum.
Particulars of G. ASTELL HALL, Esq., Solicitor, 8, Gray's Inn-square, and of the AUCTIONEERS, 54, Borough High-street, S.E., and 52, Chancery-lane, W.C.

R. I.B.A. EXAMS.
MR. W. CHURCH HOWGATE hereby announces that he has taken MR. ALEXANDER G. BOND, B.A. Oxon., A.R.I.B.A., into PARTNERSHIP, and that in future all applications should be made to MESSRS. HOWGATE and BOND.

R. I.B.A. EXAMS. PREPARATION.
personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Porchard House, 70, Gower-street, W.C. (close to the British Museum

ASSOCIATION OF DESIGNERS.

DESIGNS, WORKING DRAWINGS, PERSPECTIVES, ARCHITECTS, DECORATORS, & BUILDERS ASSISTED. INTERNAL DECORATIONS EXECUTED IN ALL STYLES.
ITALIAN. FLEMISH. GEORGIAN.

Offices : 20, JOHN STREET, ADELPHI, W.C.

SANITARY INSPECTORS' EXAMINATIONS.—An Associate of the Sanitary Institute thoroughly PREPARES CANDIDATES for the above Exams. by correspondence; no books are required.—For particulars and testimonials apply, "Certified Coach," 31, Herbert-road, Plumstead, S.E.

R. I.B.A., SOCIETY OF ARCHITECTS, and CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—MIDDLETON and GARDEN, 19, Craven-street, Strand, W.C.

WOOD-WORKING MACHINERY FOR SALE.—Trying-up Machine, with pulleys complete, to plane up to 20in. wide, and 21ft. bed. Tenoning and Scribing Machine, to cut tenons up to 9in. Tenoning Machine, double-ended, with slotting and scribing spindle. Horizontal Deal Frame, with engine combined.—For particulars and to view apply to H. H., Crown Works, South Lambeth-road, S.W. 1

PROGRAMME OF EDUCATIONAL WORK to be carried on by the WORSHIPFUL COMPANY OF CARPENTERS During 1899.
JANUARY and FEBRUARY } Weekly Lectures in the Great Hall, London-wall.
MAY and JUNE } Lectures to Clerks of Works, Shop and Outdoor Foremen in Carpentry and Joinery for Candidates for the Examination to be held in latter part of June.
OCTOBER and NOVEMBER } Lectures to Candidates entering for Examination in Building and Sanitary Construction to be held in December.

UNIVERSITY COLLEGE.
Evening Lectures and Drawing Classes during the year, commencing January 10th. Instruction in Building Construction, Architecture, and in Architectural Drawing.

KING'S COLLEGE.
Evening Lectures, Constructional and Geometrical Drawing Classes, Quantity Class, and Architectural Studio during the year, commencing January 16th. The Reference Museum open to Students as before. Wood Carving for Amateurs. Day and Evening Classes during the year, commencing January 16th.

GREAT TITCHFIELD STREET.
(For the Trade only.)
The following Classes recommended on November 28th for Carpenters and Joiners, Handrailing, Tylers and Bricklayers, Painter Stainers, Wheelwrights, Plasterers, Masons, Smiths, Stone Carver and Wood-Carving Classes, and continue during the year.

STRATFORD INSTITUTE.
Organised } Subjects taught: Mathematics, Machine Science } Construction and Drawing, Building Construction, Geometry, Chemistry, Freehand Day } and Model Drawing, and Workshop School. } Instruction.
There are also Trade Classes held in the evenings.

CARPENTERS' HALL.
A Free Lending and Reference Library for Books relating to Building or Sanitary matters is open as usual.
For further particulars apply to STANTON WM. PRESTON.
Carpenters' Hall, London-wall.

APPOINTMENTS VACANT.

WANTED, a capable ASSISTANT. Must be a good draughtsman, with architectural experience. Send samples of drawing.—State age, experience, and salary expected, and references to JAMES PERRY, M.E., M.I.C.E., County Surveyor, Galway. 1

NORTHAMPTON INSTITUTE, Clerkenwell, E.C.—APPLICATIONS are invited for the post of CARPENTER and INSTRUCTOR in CARPENTRY and JOINERY. Salary £120 per annum; full time. Applications should be received not later than January 3rd, 1899.—For further particulars apply, by letter, to R. MULLINEUX WALMSLEY, D.Sc., Principal. 1

WANTED, an experienced ARCHITECTURAL ASSISTANT. Must be well up in quantities.—Apply, with full particulars as to experience, salary, &c., to C. R. DALGLEISH, Architect, Talbot-chambers, Shrewsbury. 1

ARCHITECTURAL ASSISTANT.—A firm of Civil Engineers require for a permanency in their office, a competent ARCHITECTURAL ASSISTANT, who possesses a knowledge of surveying and levelling.—Address, stating age, experience, and salary required, Box 933, BUILDERS' JOURNAL. 1

APPOINTMENTS WANTED.

YOUNG ARCHITECT, A.R.I.B.A., DESIRES to ASSIST others in the PREPARATION OF DRAWINGS at his own office.
G. SCOREE, 28, Newman-street, W.

ANSELL and MALLOWS, Architectural Draughtsmen and Quantity Surveyors, 21, Buckingham-street, Strand, W.C. 1

JUNIOR ASSISTANT seeks an appointment. Neat and quick draughtsman. Good colourist, tracer, Able to make small surveys.—E. SNARE, George-street, Brandon, Suffolk. 1

TO Builders, Decorators, Sanitary Engineers, &c. Evening assistance by contractor's assistant. Accounts, estimates. Expert sanitary reports and details. Good general draughtsman. Terms moderate.—Apply Box 932, BUILDERS' JOURNAL Office. 3

ADVERTISER, having spare time, prepares plans, designs, details, specifications, surveys, &c., for all building purposes at moderate charges.—J., care of Mr. Burr, 65, Chancery-lane, W.C. 3

ASSISTANT DRAUGHTSMAN or ESTATE AGENT. Three years with builder at books, accounts, plans, specifications, and quantities. Fourteen on large estate; receiving rents, making plans, overlooking work erection buildings, ordering materials. Good testimonials.—"Provinces," BUILDERS' JOURNAL Office. 2

ARCHITECT'S ASSISTANT (21; good junior) desires ENGAGEMENT immediately. Fast and neat tracing, colouring and inking in, working and detail drawings, &c. Moderate salary.—Address, "A," 3, St. Martin's terrace, Dover. 1

CLERK of WORKS.—Thoroughly reliable Man seeks POSITION as above on stone job or estate. Excellent testimonials. Fourteen years' reference.—E. G. THORNTON, Milton, Chipping Norton, Oxon. 1

An Architectural Causerie.

Suggestion for a "Client's Exchange." It must be a matter of very general observation and surprise that, in Architecture, the knack of getting work and building up a practice has little or no relation to the acquirements or real abilities of the architect. Thus we often see men of magnificent qualifications and proved abilities who wait in vain for work which does not come, while in the same street a drawing-room *dilettante* of no experience or attainments, or a self-styled "architect" of no education or artistic discernment, is kept busily and profitably employed. One proffered this remark to one's predominant partner, and he honoured it with a prompt endorsement. "You're right," he said, emphatically, "it is so, it's the incompetent men, not the brilliant and distinguished men, who get clients most readily. I've been in practice now over seven years, as you know, and how many commissions have I got? What are you laughing at? I tell you I could count every client I ever interviewed on my fingers." One here interposed and told him he should say his "thumbs." This remark annoyed one's predominant partner very much, and he remained dumb with disgust for several minutes. Then he turned round from his drawing and said savagely, "Well, then, why don't you bring some work into the office?" To which one replied, "It's the incompetent men, not the brilliant and distinguished men, who get clients most readily;" but after the protracted wrangle which followed, causing one's predominant partner, among other things, to miss his train, the matter suggested itself to one as presenting most remarkable opportunities for commercial enterprise if only the Profession could be persuaded to set aside prejudice and rules of etiquette and frankly view the relations of client and architect on the basis of their true limitations and possibilities. What specially held one's thoughts was the conviction that as ability in the practice of Architecture and ability to acquire clients were obviously not identical, and evidently implied distinct qualities and gifts, certain men were specially fitted to win the confidence (and building commissions) of the public, while others were specially gifted for the designing and supervision of works. This being the case, one perceived that if each practitioner were to employ himself solely upon the work in which he was best fitted to excel, he would advance his own success, and, upon a well-established principle, the division of labour would benefit the community by allowing the practice of Architecture to be conducted with greater perfection and economy. On following out this idea to its issue, one realised that the first essential for securing an efficient and proper facility for the application of the notion to the needs of the time would be the introduction of a system of mart and exchange, where architects who had clients to negotiate might do so, and where those who were in a position to purchase might have an opportunity of finding what they wanted. The need for some

such convenience for architects, whether the system here suggested is literally adopted or not, is very apparent. We may see on one side young men of power and attainments who wait year after year for a chance of showing their capabilities, and, on the other, established men who, having passed the waiting period, have so much work that they are obliged to turn away would-be clients from their doors. Now why should any architect feel under obligations to refuse a client whom he has acquired through his own ingenuities, the exercise of humiliating self-repression, practised craft, and masterly tact? Such a client is his fairly earned property, and the Profession should sell and exchange clients as advocates sell their briefs

inauguration of such a publication, a column set apart for these advertisements in the professional journals would serve all present needs. It would probably be unadvisable to insert these advertisements in the daily or general press, as it is possible that a certain class of clients, should they chance on the advertisements of their own exchange, would perhaps become a little "difficult." In order to show the thoroughly practical nature of this proposal, to illustrate the need there is for some such institution, and to impress our readers with the undoubted feasibility of the suggestion, a few advertisements are appended, such as might be expected to appear under the heading "Clients for Sale!"

CHEAP! TO YOUNG ARCHITECTS. For

CLUB HOUSE, PORT SUNLIGHT. MESSRS. GRATSON AND OULD, ARCHITECTS.

in the Scottish Courts. The transfers might be difficult to effect at first, and would always call for subtle tact, but there need be no fear of a revolt of clients, and the usage would soon become a matter of precedent, and a privilege of the Profession. So far as one can see, the best medium for making architects' wants known to one another would be a publication which would advertise clients "Wanted," or for "Sale" or "Transfer." The periodical might be called "The Clients' Exchange." In time, quotations of the largest transactions of the week would be looked for, and there would be undoubted need of an article on the state of the client market from time to time. Pending the

Sale. Three Maiden Ladies. A crack has appeared in back wall of town house. Family nervous, as District Railway below. With a little pressure would undoubtedly consent to underpin throughout. Vendor has no reason to suppose drains not to be thoroughly out of order. First-rate opening for pushing gent of good appearance and address. What offer? Money returned if Vendee does not obtain commission. "Squillgee," Box A9372.

£500. A GREAT BARGAIN. £500.—Will take £500 for rising GLUE BOILER in the prime of life (43). Owing to family circumstances, will part with said client as above for £500, CASH DOWN. Has already built at vendor's suggestion: vat house,

£15,000; town residence in provincial city, £20,000, with £3000 extra in carved brick and terra-cotta tiles on front. J. P. and Chairman of District Council. Could easily be induced to pull down vat house and build another. Country seat in contemplation; house in Park Lane final ambition. Price only £500 (cash), including all privileges. "Jumbo," Box 9321.

VICAR (Low Church). Will be glad to exchange my SUFFOLK VICAR or negotiate same for ten guineas. This sum includes complete contract drawings with specification and quantities for new tower and spire to church (1872). Ditto, ditto, doxas mission house (1875). Ditto, ditto, additional study and conservatory to vicarage; stables to same; classic temple and fountain in garden (1876, 1878, 1881). Also seventeen alternative sets of sketch designs for other works not yet approved for contract (1870 to 1895). None of the works here mentioned have been executed so far, and no payment has yet been made to architect. Will sell the lot with full privileges for £10 10s., and will pay *bonâ-fide* intending purchasers third class return fares into Suffolk to view sites and vicar, if desired. "Rus.," Box 72311.

B. C.

On Reflection.

Two Picture Exhibitions.

THE collections of pictures at Burlington House and the New Gallery will no doubt attract the wide attention they deserve. The Rembrandt exhibition constitutes probably the finest display which has been arranged within the walls of Burlington House since the inauguration of the winter "Old Masters" exhibitions thirty years ago. Four rooms are filled with the paintings, and in a fifth are arranged some of Rembrandt's choicest drawings. From time to time this painter has been included in these winter exhibitions, but we believe that he has not been represented since the "one-man show" became a popular usage. Nearly all the pictures shown are the property of English lenders; they include most of those which chiefly distinguished the late Exhibition of 123 paintings at Amsterdam, and many more besides, for England is richer in the great works of this master than any other country. The exhibition of pictures by the late Sir Edward Burne-Jones is aptly displayed within the walls of the New Gallery. The little Regent Street Gallery was inaugurated largely with the intention that it should form a home for works of Art of ideal aspirations, such as ill recommended them to the conservative policy of the Hanging Committee of the Royal Academy. It has from the first been associated with the designs of Burne-Jones, and it is only six years since the directors of the Gallery arranged an exhibition of his exclusive works. The present collection of two hundred and twenty-five paintings, drawings, and designs comprises the majority of those which found place in the Gallery on the above-mentioned occasion, with certain additions; and little of the painter's most conspicuous and notorious work is absent, although the reason which excluded the Briar-Rose series on the first instance holds good also for this. The pictures are framed into the panelling of the room for which they were designed, and cannot conveniently be moved. The fact of an exhibition being repeated at such an unusually short interval, although popular sympathy with the painter is no doubt enhanced by his lamented death, speaks eloquently for the wide acknowledgment which has crowned the long, solitary years of ungrudging labour, and unflinching zeal and conviction, which the painter lavished towards the perfecting of his art.

"One Man" Shows.

ALTHOUGH the system of collecting the work of one painter upon the walls of an Art Galleries, which has found such general favour among promoters of exhibitions in London during the last few years, may have little to recommend it to the connoisseur or to the accomplished student of Art, the usage fulfils far more valuable purposes than its wide popularity would lead us to expect. To understand the work of an artist, whatever his medium of expression may be, we need to have close sympathy with his personality; with his æsthetic and intellectual purpose; and with that subtle quality which distinguishes the man from all others of his craft. When once this peculiar essence of any artist has been grasped and assimilated, and not till then, can we thoroughly appreciate his good work or confidently condemn his failures. A practical student and critic may be able to read the generative impulse of the artist from a single work, but most of us, if we are to be brought into this intimate sympathy with the man, need first to be set in an exclusive atmosphere of his achievements. In such circumstances we see the man in many moods and many modes and phases; we are persuaded to a sympathy with him, and therefore to a supreme understanding of him, which we could never attain from a desultory acquaintance with his works. Particularly does this principle apply in the case of picture galleries, where in general the several ideas of each painter are seen in an inharmonious proximity to the ideas of others, and the sympathy is no sooner attuned to the ideal of one artist than it is required to leap to a similar intimacy with a new and diverse personality. The one-man exhibition finds favour with painters; and it may be remembered that Turner's bequest to the nation was conditional upon the exhibition of his pictures being self-contained and exclusive. It is probable that this usage has done much to educate public taste and popularise pictures—the Christmas supplements to the weeklies, of humorous cats and puppy-dogs, notwithstanding.

Clonfert Cathedral.

THE Rev. Canon McTearney, writing to the Saturday Review from Banagher, draws attention to the decayed condition of Clonfert Cathedral. During the last five years nearly £1100 has been collected, and the restoration of the chancel and sacristy is now completed, but some £2000 more is needed to put the nave and transepts into proper repair, and, as Canon McTearney points out, it is difficult to raise money for such purposes in Ireland. "Mr. Ruskin has sent me a donation," he adds, and in this he should congratulate himself, not only on the addition to the fund he is interested to raise, but also in that he has succeeded in urging Mr. Ruskin to mitigate his hitherto vigorous intolerance for all kinds of restoration. Devotees of Mr. Ruskin's teaching on the subject of Architecture may in future therefore hold that, while the highest ideals and sentiments of Architecture dictate that an ancient building shall be allowed to succumb to natural decay, and that the period of its gradual dissolution may be protracted only with props and "crutches"—to use Mr. Ruskin's term—there are yet demands of practical usefulness which may justify timely and judicious restoration. Many of us may have regretted that, in the prefaces to certain late editions of his works, the author has repudiated the convictions of his earlier writings, and spoken with a sort of intolerance of the conclusions therein expressed, but few will regret that he has, by implication, modified the extreme rigour of his views on the subject of church restoration. We hope Canon McTearney will speedily see the completion of the work he has so much at heart.

Cardiff Municipal Buildings.

WE learn from a report of a meeting of the Town Hall Committee of the Cardiff Corporation, printed in the South Wales Daily News, that the committee is much divided upon the subject of whether or not the township can afford the funds necessary for carrying out these buildings, and a proposal to postpone the operations indefinitely was only negated by a majority of three on a vote of fifteen councillors. It seems that the Corporation is under obligation to complete the Cardiff "Western Sewer," which has been under approval some eight years, and are reluctant to burden the rates with the additional expense involved by the erection of the municipal buildings. It is not easy to understand why this matter of funds, which is the one and only essential to building, was not settled before the expense and trouble of organising the late competition and appointing architects and procuring plans to be made, was entered upon. It is, however, we notice, quite commonly the rule of procedure with municipal authorities, particularly in the smaller provincial towns, to organise competitions for buildings which, as circumstances afterwards reveal, they could never reasonably hope to erect.

Commissions.

WE take off our hat to the members of the committee of The West Cliff Land Development Association, Herne Bay. The Association desires to build, and with a bland, childish simplicity advertises, inviting architects to tender terms for supplying plans and estimates and superintending the erection of buildings on their estate. The simplicity of the Association here yields to the claims of worldly prudence, for they do not bind themselves to accept the lowest or any tender. What does the Association think they are to gain by such an invitation? If thereby they suppose that they will get their Architecture more cheaply than by entering into private agreement with an architect, they are grievously mistaken. In the first place, they can hardly hope to get Architecture at all; and in the second, they will pay heavily for what they do get. No reputable architect would compete for the commission upon such terms, and the man who can afford to send in the lowest tender is the man who has the fewest scruples against being "squared" by the contractor, and availing himself of the commissions offered by the various trade agents. In the moral philosophy of our nurseries, greedy children always suffered afterwards. It is gratifying to observe that this sound principle holds good also for adults in other connections.

THE Guildhall Museum has just received a valuable addition to its antiquarian treasures, in the shape of some interesting relics of underground London, which have been presented by Sir Benjamin Baker, the well-known engineer, and the City Commissioners of Sewers. The articles in question were discovered during the excavations which have been made in connection with the Bank and Newgate stations of the Central London Railway. Among them are an engraved brass rowel spur of the seventeenth century, a portion of a horseshoe, several specimens of Samian ware, a Venetian wineglass, and a platter of painted Delft ware, also of the seventeenth century, with some green glazed ware, a white stone jug, and a few human bones. These, together with some Roman antiquities, also dug up at the corner of Queen Victoria Street, near Walbrook, and a curious cast-iron plaque representing the killing of the "goose with the golden egg," which was discovered in the cellar of an old house in Smithfield Market, have been placed near the famous collection of relics of underground London which were gathered together by the late Mr. Chas. Roach-Smith, F.S.A., of Strood.

WIGHTWICK MANOR, WOLVERHAMPTON. MESSRS. GRAYSON AND OULD, ARCHITECTS.

Men Who Build.

No. 55.

MESSRS. GRAYSON AND OULD,
LIVERPOOL.

THE conditions of architectural practice at the end of this 19th century are so remote in principle from all other conditions hitherto in vogue, and their influence upon modern Architecture is so persistent, that insufficient stress is ordinarily laid upon them. A brief *resumé* of any man's work now-a-days consists largely of a comparison between his actual productions and those of bygone days; generally much to the disadvantage of the former and to the undue glorification of the latter. Such comparisons, driven too far, obviously soon become meaningless. The architect of today is so hemmed-in by practical requirements and unavoidable limitations, such as were quite unknown to the master builders of old, and are still foreign to our brother artists the painter and the sculptor, that it is the exception rather than the rule for a design to be carried out in its entirety. Much in the transition from the brain of the designer to the concrete form loses its salient points, and thereby but surges into the great sea of the uninteresting and banal. We do well, therefore, to put aside materialistic thoughts, and to look at the ideals after which a man is striving, for, after all, a truer estimation of the work of a man may be gathered from the nature and extent of his ideals, than from his shortcomings in the earnest endeavour to realise them. The art of Architecture, however, is such an obtrusive one; we are brought face to face with it at every turn, and it acts and re-acts upon our daily life to such a degree that we are forced to lose sight of the individual, and, whether justly so or not, to challenge the work to tell its own story and to be its own judge. In the hands of a skilful worker these same limitations become often the very pegs upon which to hang the tangled skeins of the imagination, the key-notes to the proper accentuation and characteristic expression of the design. They are not to be masked and slurred over, but to be faced and overcome. To turn them to good advantage is in itself

an achievement—the goal of an architect's ambition—for the aspect of our towns and cities has depended, and still depends, more and more upon the artistic solution of intricate and difficult problems.

Forty years ago, when Mr. Grayson commenced practice in Liverpool, there was much in store for him in a city rapidly increasing in commercial and civic importance. Its history for the last half century has been one of amazing progress; the results with which we are mostly concerned here are the outward and visible ones of expansion of area and erection of buildings worthy of the spirit of its citizens. In common with most English cities, to contemplate the general setting out gives rise to melancholy at the thought of the magnificent opportunities heedlessly thrown away in the past. Here the rising ground, with endless vista from the broad and noble river, so suggestive of breadth and grandeur, and power, conjures up in the mind a city second to none for monumental splendour; but what could not be done in the Capital of the Empire at a time when Providence seemed to create the opportunity, while at the same moment providing the genius large enough to seize it, could hardly be hoped for elsewhere under less propitious circumstances.

Mr. Grayson was not called upon to lay out new streets, but to erect buildings in a city which already boasted the one truly great classic monument which the movement, then scarce dead, has bequeathed to us. He early showed himself to be thoroughly in sympathy with that movement, and although the weathercock of public opinion has shifted round in all manner of directions since those days, he has never swerved from it, but still finds unwearied pleasure in furthering classic Architecture as being first and foremost the most adaptable and expressive for buildings in a town where all is formal and man's handiwork stands alone. His work is not the dry bones of classic art. Like the best of modern work, it is eminently inspired by modern life, and is classic in spirit rather than in letter.

In 1887 he was joined by Mr. E. A. Ould, and almost the work of a lifetime seems to have been compressed into the short period since that union. The partnership has been productive of much good work, both in town and country, and examples are so numerous that we cannot attempt here more than a mere mention of by far the greater number. Confining our attention for the present to town and commercial buildings as distinguished from country and residential ones, we must

not pass over the railway stations erected at either end of the Mersey tunnel, which form such prominent features with their conspicuous towers, carried nearly as much below the ground as above it, and again the North Shore Mills stores and elevators, alongside the docks, where is stored a larger supply of grain than in any other single structure in the kingdom, and the very extensive annexe to the County Asylum at Rainhill. Of banks and insurance offices alone Messrs. Grayson and Ould have erected a round number in Liverpool. There is no mistaking them for anything else. They are strong looking, and each one at a glance distinctly proclaims its peculiar function in the life of the city; and this quality of expression is at the root of all architectural design.

The new building just finished for the Bank of Liverpool, in Water Street, is unquestionably one of the finest of its kind erected for many years past, and is a credit and an ornament to the city. An illustration of it is given in our supplement, but to realise the massiveness and weight, and yet airiness and grace, of the general mass, and the refinement of the detail, one needs to ponder long and often in the shadow of the thing itself. Grey granite, shipped already worked from Dalbeattie, has been used for the whole of the façades above the plinth line, and the great charm of the design is to be found in the reticent and workmanlike handling of this suggestive but stubborn material. It has been allowed to show its strength and natural beauty of texture in a manner which cannot be too highly applauded. The ornament is massed, for the most part, in the tympana, and is Grecian in *motif*. One has become so accustomed to associate granite with Runic carving, that it is most refreshing to see here how equally applicable are the broad, flowing lines, and severe simplicity of the best period of Greek art when properly brought out in the new material. In this case the success is largely due to the architects having worked in conjunction with a first rate sculptor, instead of handing the carving over *en masse* to a badly-trained craftsman to be carried out in the universally accepted stock patterns.

Castle Street, one of the most important thoroughfares in the business part of the city, has been largely rebuilt by Messrs. Grayson and Ould. They have risen to the occasion, and, whilst imparting a distinct individuality to each block, have not in any way sacrificed the harmony of the street as a

PROVISION WAREHOUSE, MATHEW STREET, LIVERPOOL. MESSRS. GRAYSON AND OULD, ARCHITECTS.

whole. Indeed, it has few equals as it is; and if the dome of the Customs' House had ranged on its axis as does that of the Town Hall, instead of being slightly off it, Liverpool would possess one of the most impressive streets in the country. The premises for Messrs. Jones and Sons form a good corner opposite the Town Hall, but they are rather overpowered by the Edinburgh Life Insurance, recently built next to them. The new bank for Messrs. Leyland and Bullins, the Scottish Equitable and Queen's Insurance Buildings (Nos. 28-32, Castle Street), the Victoria Buildings, and the British and Foreign Marine Insurance, are all worth more than a passing mention. The last named shows a fine use of colour, (minutely suitable for town Architecture. It is a massive structure in red brick and stone, well balanced, with just enough play of line produced by the slightly curved bays to arrest the eye and lead it to the frieze, which is the special feature of the façade. This frieze is illustrative of old and modern types of mercantile shipping, as shown by a ship of the time of Queen Elizabeth and by a modern Atlantic liner, and is executed in bright glass mosaic in various colours. It was carried out by Salviati, and attracted a good deal of attention at the time of its exhibition in London. The effect *in situ* is striking and most happy. Our streets might be made bright and resplendent with colour; the deadly monotony of grimy wall surfaces become a thing of the past, if the example here set could be followed more generally.

Another instance of the introduction of a coloured frieze by the same architects as an integral part of the design is to be seen on the provision warehouses and offices at the corner of Mathew Street. Again the subject depicted declares the *raison d'être* of the building, and interest is at once awakened in the passer-by.

As the provisions consist primarily of bacon and cheese, the *motif* of the design centres in the decorative treatment of agricultural operations, especially the raising of pigs, cattle, &c. The whole was executed by Mr. Goodall, of Liverpool, in modelled Portland cement sgraffito of two colours, slightly sunk within enclosing mouldings which protect it and frame it in. It is a question whether this mode of decoration is really applicable in the heart of a town where the edges left after cutting down the successive layers of coloured plaster form so many ledges for the accumulation of soot. The more colours introduced the more does this objection hold. With two colours only as in this example, namely, dull red and creamy white, the advantages undoubtedly outweigh the disadvantages, and, with occasional cleanings, there is no reason why it should not be much more frequently used, even in smoky atmospheres.

Few men have done more to place the designing and planning of country houses upon a sound basis. In most matters concerning monumental Architecture, English architects have yet much to learn. Our Continental contemporaries have succeeded far better, for the reason, no doubt, that scope to realise their ideas is more often allowed them; but the "home" feeling, so pronounced and so peculiar to this country has found expression in a type of domestic work which absolutely holds its own with anything that has ever been done. We hear much about the lack of originality and want of style in these days; but let the pessimists who continually lament in this strain look for awhile intelligently at our purely domestic work. The requirements in a house now are multifarious as compared with the simple unconventionality which satisfied our almost immediate predecessors. Our civilisation

requires it. No longer does a stately exterior, symmetrical at all costs, but with complete disregard of internal comfort and privacy, satisfy our needs. A house, as has so often been said, is to live in, and must, before all things, be a "home" in the full sense of that wide-meaning word. When we approach one of Messrs. Grayson and Ould's houses, the first impression is always one of complete homeliness. This applies equally to the little cottage residence and to the large country house bordering on the mansion, and they have built many of each description.

Mr. Ould, from the first, devoted himself particularly to the thorough mastery of the construction and design of the half-timber work for which Cheshire, Shropshire, and in a lesser degree other western counties are so justly famous. This is little to be wondered at, seeing how much he was thrown amongst them, and that his early practice was carried on in Chester itself, which yields to no other town for the picturesqueness and quaintness of its streets. Here then is the source of inspiration of much of Mr. Ould's country work, whilst his leaning towards the Jacobean often shows itself in internal details.

Few architectural deceits have been more persistently pursued than the so-called half-timber construction; so much so that one naturally assumes that the timbers are only skin deep in modern work in the absence of reliable evidence to the contrary. This, undoubtedly, has cast a slur over this kind of work in general, but, when truthfully constructed of good oak and designed with restraint, few materials will give more charming qualities of texture, subtler play of line and harmony of colour; it takes its place in Nature's setting, and what it borrows fully pays back.

The greater part of Messrs. Grayson and Ould's domestic work, although by no means all of it, will be found in Cheshire. In the houses erected at Bidston for Mr. Hudson, and at Thornton for the Messrs. Lever, the full capabilities of the type of design we have been discussing are admirably shown. Whilst strictly adapted to modern requirements in plan, the design in the main is on traditional lines, with such variations of detail as infuse the whole with spirit and true individuality. In the one case—that of Bidston Court—as is well known, the two bays in the quadrangle are as careful and as exact a reproduction of part of Old Moreton Hall, in Cheshire, as it was possible to make them, and the inscription carved on the beams records the fact. We owe a debt to the architects for thus preserving for our enjoyment and for that of future generations a perfectly unique and charming piece of 16th century design. This is not copyism; it is a thousand times better than restoration. The harm comes in only when a design is taken haphazard and transplanted, may be from one country to another, from one climate to another, with utter disregard and the intention of passing it off as an original design. When, as in the case of these bays, the new structure declares itself to be a reproduction of a weather-worn and decaying one not many miles away, the principle is good, and will bear of application to many a crumbling masterpiece, and be far more valuable than all manner of records in the form of measured drawings and photographs, which only too often fall into wrong hands. The remainder of this extensive house is entirely new in design, but it is so familiar, through constant illustration, that we leave it to look at others not so well known. As must inevitably be the case with the majority of country work, Messrs. Grayson and Ould's is hidden away, and difficult of access to the student.

At Port Sunlight and the village of Thornton Hough, about four miles distant, are to be found numerous blocks of artisans' dwellings, some of which are here illustrated. It is hoped before long to devote a whole article to the model village of Port Sunlight, one of the most interesting results of the present widespread movement, fortunately gaining ground every day, which aims at wresting the smaller class of property from the grasp of the jerry-builder, and showing that art and Architecture are as much at the service of the lowly as of the rich.

Both Thornton House and Hesketh Grange, situated within a short distance of one another, and built within the last few years, illustrate the matured type of country house of which we have been speaking. Each is complete in itself, and reaches as near perfection of its kind as anything we know of. To take Thornton House, of which a part of the exterior is given in our supplement, everything falls into its place quite naturally, and frankly expresses the internal arrangement; nowhere is there forced grandeur—nowhere artificial dignity; it is first and foremost, inside and out, an English home. The warm-tinted sandstone, quarried and worked in the neighbourhood, has been used with oak left absolutely untouched from the saw, which has already mellowed into soft silvery tints; the oak pins left standing well out explain the construction and become quite decorative at

of the ample headroom, one is too much occupied with stooping beneath it to be able to see anything.

Further afield Messrs. Grayson and Ould have carried out many large domestic works. Suffice it to mention Sir Alfred Hickman's mansion, Wightwick Manor, here illustrated, and The Mount, all at Wolverhampton; Irton Hall, Dunstall near Hull; Nidd Hall, Yorks; and St. Helen's, Dublin, for Mr. Nutting, just finished; whilst Mr. Ould, in his early practice, built many houses and cottages in and about Chester for the Duke of Westminster. With such a lengthy roll of important commercial and domestic buildings, the ecclesiastical has, as one would expect, found only a secondary place. These are becoming more and more days of specialism. Besides St. Faith's, Waterloo—now building—the churches at Woolton and Allerton merit attention as

ART OR MUTILATION?

OLD CUSTOMS IN GARDENS.

WHATEVER may have been the merits of the Tudor gardens they had their defects, and were certainly not superior to those of the Victorian era, as some writers would fain have us believe. Mr. George Gordon, writing in the *Gardeners' Magazine*, says the shaping of trees with shears and knife is frequently spoken of as mutilation, but with greater propriety it is called topiary work, from the Latin "*topiarius*," shaped by cutting, the word being used in this sense by Pliny, Vitruvius, Cicero, and other classical authors. It is undoubtedly true that the

COTTAGES AT PORT SUNLIGHT. MESSRS. GRAYSON AND OULD, ARCHITECTS.

the same time. Inside, mahogany has entered largely into the scheme of decoration, the idea of the half-timbered work outside being carried through by means of ribbed ceilings and panels on the walls. The boudoir illustrated, however, is in oak, with an open ceiling, divided into bays by curved ribs, supported on carved corbels, representing Shakespearean characters.

At Hesketh Grange, plaster modelled *in situ* is used above the first floor level with a richness of effect which is most pleasing in reality, but which is quite lost in the illustration here given. Many of the rooms are panelled in satin wood or mahogany, perfect in figure and finish. Only one unpleasant reminiscence remains of this sumptuous interior, and that curiously not an uncommon one—an arch is thrown across the hall at the start of the stairs, so that, in descending, the view of the hall is completely obscured till one reaches the bottom steps, when, in spite

of the ample headroom, one is too much occupied with stooping beneath it to be able to see anything.

The new buildings at Trinity Hall, Cambridge, also the Master's Lodge, Dining Hall, and Combination Room were recently won in limited competition, and, with the New Clergy School in the same town, are now in progress, whilst extensive rebuildings for the Liverpool Stock Exchange are occupying Messrs. Grayson and Ould just now. Enough has been said to show the important part that this firm—which was further strengthened in 1897 by the admission of Mr. Hastwell Grayson—is playing in the architecture more especially of the North of England, by setting a high standard, which they not only maintain themselves, but in so doing unconsciously influence others to emulate the masterpieces of a great art, which not only has a Past and a Future, but, beyond all, a Present.

natural form of a tree is the most beautiful form possible for that particular tree; but it sometimes happens that we do not want the most beautiful form, but one of our own designing, for the sake of the variety it affords. So far as authority bears on the subject, it is distinctly in favour of topiary, for the Romans recognised the shaping of trees into architectural forms as an essential part of the gardening art. Shakespeare is quoted as an authority on a great diversity of matters, and more particularly in defence of "the natural style of gardening." But there can be no question that the garden of Shakespeare's time was a garden of knots and topiary. It was enclosed with hedges of clipped hornbeam and yew, and embellished with arbours, obelisks, pyramids, and spires of verdant greenery. The "curious knotted garden" mentioned in the letter of Arnado, in the first scene of "*Love's Labour Lost*," was, beyond all doubt, furnished with examples of the topiary art.

THE STUDY, BIDSTON COURT. MESSRS. GRAYSON AND OULD, ARCHITECTS.

DUTCH AND FRENCH.

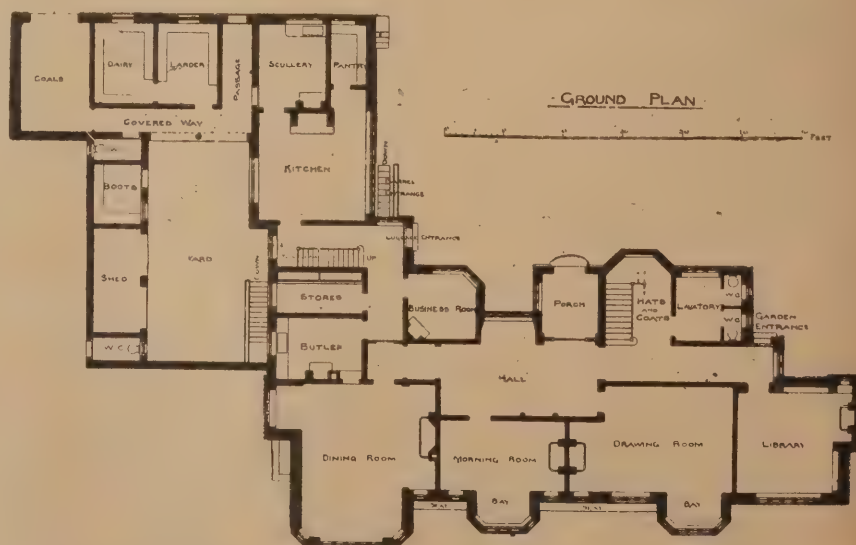

Shakespeare was familiar with such gardens as the one above described, and approved of the prevailing taste of the time. Bacon had no liking for clipped trees, and with reference to them he says in his essay: "I for my part do not like images cut in juniper or other garden stuff; they be for children." We can go back to a time long anterior to Shakespeare for authority for the shaping of trees into fanciful forms, for the topiary art was practised with much success in Roman gardens in the first century of the Christian era. It attained a high state of development in the gardens of Pliny's Tuscan villa. There can be no doubt that the garden of Pliny's villa, as it existed at the end of the first century, when, under the reign of Trajan, Rome was at the zenith of her glory, set the fashion of European gardening for many centuries. It was not until the sixteenth century that clipped trees came into vogue in this country, and this is not surprising, as it was not until the termination of the Wars of the Roses, towards the end of the fifteenth century, and Henry VII., the first of the Tudor line, had ascended the throne, that gardening in any form obtained attention. With a cessation of internecine wars a new style of Architecture was adopted, and the garden was no longer confined within the moat with which houses of importance were in those days surrounded. This extension of area gave greater scope for the exercise of taste in the arrangement of the garden, and also for the cultivation of ornamental plants. The first of the introductions consequent on this change were flower beds enclosed with low railings, which acquired a considerable degree of popularity, and remained in use for a long time.

GARDENS OF TO-DAY.

The most noteworthy example in England of the Dutch style of gardening, in which the topiary art attained its highest degree of development, is at Levens Hall, Westmoreland, the residence of Captain Bagot, where no material change has been made in the grounds for at least two centuries, and where, consequently, may be seen the form of garden that found favour with William III., who exercised so great an influence in developing a taste for the Dutch style, in which clipped trees were so prominent. With the flight of James II., in 1688, Colonel Grahame, who was one of the king's most devoted adherents, retired to his Westmoreland estate, and some time subse-

quently he engaged M. Beaumont, who had made considerable alterations in the Hampton Court Gardens, to lay out the grounds. There is now a tendency to restore some of the screens which formed so characteristic a feature of the Dutch style, with a view to obtaining a greater degree of privacy, and more shelter for both visitors and plants. With this restoration of sheltering hedges and verdant belts has evidently come a desire for examples of topiary art, and already there are several modern gardens where they are to be found firmly established.

MR. LEOPOLD DE ROTHSCHILD'S splendid residence, Gunnersbury House, Acton, is undergoing some alterations and improvements. In excavating the foundations of the new drive the solid foundations of the historical mansion inhabited by Princess Amelia have been unearthed, and the old wine cellars have been discovered, whilst at the south-east corner of Gunnersbury House has been found a fine piece of brass work fencing, in each panel of which is a shield having the motto of the Order of the Garter, enclosing the initials of George, Prince of Wales.

GROUND PLAN OF THORNTON HOUSE, CHESHIRE. MESSRS. GRAYSON AND OULD, ARCHITECTS.

THE FEUDAL PRINCIPLES OF REAL PROPERTY LAW

BY WILLIAM H. STACPOOLE, LL.D.,
Barrister-at-Law.

IV.

THE other species of socage tenure which I mentioned in the last article as having been feudalised after the Conquest is gavelkind, which word is derived from "gavel," or "gafol," an old name for rent.

The term gavelkind has been used in several different senses, of which Mr. Elton enumerates five in his "Tenures of Kent." The proper answer, however, to the question, What is Gavelkind? is this: Gavelkind is the common law of the County Kent, by which, on the death of the parent intestate, the land descends to all the sons in equal shares.

Let us consider this. There are two kinds of customs incident to gavelkind, viz., (1) special customs which are not essential to gavelkind; (2) general customs which are essential to gavelkind, which, in fact, constitute gavelkind, provided always that they exist in the County Kent.

Examples of the special customs which are only collateral, but not essential to gavelkind, are as follows:—

- (a) That the husband shall be tenant by the courtesy of a moiety, whether he has issue or not.
- (b) That the wife shall be endowed of a moiety.
- (c) That the infant shall have power to alienate his lands by feoffment (the most ancient method of conveyance, which will be described presently) at the age of fifteen.
- (d) That the estate does not escheat in case of attainer and execution for felony, the maxim being "The father to the bough, the son to the plough."*

The general custom which is "parcel of and comprehended under the name of gavelkind," "which, of itself, will constitute gavelkind, and without which it cannot exist," (b) "is partibility among the males," or the equal division of land, on the death intestate of the parent amongst all the sons.

Partibility, by which is meant this equal division of lands amongst the sons, or other male heirs if there be no sons, exists in some other places besides Kent. But in such other places it exists only as a special custom which requires to be specially proved. Elsewhere than in Kent, if a man dies intestate leaving an estate of inheritance, the presumption always is that the eldest son, or other nearest male heir in default of a son, is solely entitled

* Escheat for treason or felony was, however, abolished in all cases by 33 and 34 Vic. ch. 23, s. 1 (passed July 4, 1870).

to the estate; and if it be asserted that, according to the custom of the locality where the estate is situated, it is partible (or divisible equally among the sons or other male heirs in the same degree of kindred), then the *onus* lies upon the person who makes this assertion of proving the existence of the alleged custom which, if it exists at all, exists in opposition to the common law of the country.

Now, in Kent, the presumption is exactly the reverse. Here, partibility is the common law of the county, so that if a man dies intestate, leaving heritable lands in Kent, the presumption is that the lands are partible, and this presumption can only be overcome by proving either that these particular lands have been expressly disgavelled by an Act of Parliament, or that they are subject to a special custom of primogeniture which runs in opposition to the common law of Kent.

Gavelkind is now the common law of the county Kent only, but before the Conquest it was the common law of England. (c) Partibility, which is gavelkind, was, except where controlled by burgage, a universal incident of the socage tenure until, elsewhere than in Kent, it was converted after the Conquest into primogeniture to suit the exigencies of the feudal system. It is natural, therefore, to ask why this ancient common law should have been preserved in Kent, and not in other counties? To this question several answers have been given. Blackstone suggests that the Kentish men won the privilege of retaining their ancient custom of gavelkind by the stoutness of their opposition to the Conqueror; (d) Mr. Elton, on the other hand, regards gavelkind as "a special privilege obtained by the early submission of the province." (e) Mr. Somner, however, whose account seems the most plausible, supposes that the Kentish men, being chiefly yeomen, did not care for the prestige attached to the military tenures, and "were more careful in those days to maintain their issue for the present, than their houses for the future," so that they "were more tenacious, tender and retentive of the present custom than generally those of most other shires were." (f)

Since all lands in Kent are presumably gavelkind, and held to be such until the contrary is proved, the question arises; How can it be proved with respect to any particular land that it is not of the nature of gavelkind? The answer is: By proving that it was held by

the tenure of Knight's service before the Conquest (g).

The land may have been used, owing to the ignorance or indifference of those concerned, to descend according to the custom of primogeniture, but nevertheless, it always remains partible among the sons or other male heirs, unless it can be shown to have been specially disgavelled by an Act of Parliament, or to have been held in Knight's service before the Conquest, and the burden of proving either of these propositions lies upon the person who maintains it. Thus Robinson says "Mr. Somner pp. 49-50, and Mr. Lambard, in his *Peramb.* 503, 538 (h), are both of opinion that gavelkind in this county is to be tried by the manner of the socage services, and not by the touch of some former partition, and that, though the land has never been parted in deed, yet if it remains partible in its nature" (that is to say, if it be gavelkind, which it is presumed to be, until the contrary is proved in one or the other of the above ways) "it may be parted whenever there shall be occasion." (h).

The custom of gavelkind, which, as I have said, is the common law of the County Kent, is not lost because it may have been neglected or disobeyed. No period of nonuser can affect it. "The law of gavelkind," says Lord Mansfield, "is unlike all other customs; it is not good if it begins only just before the reign of Richard I. This custom existed long before any such customs, and almost before any history. . . . The appropriation in subsequent times (after the Conquest) of any

(g) Robinson on Gavelkind, pp. 28, 30. As to Knight's service in England before the Conquest, see note to last article.

(h) Robinson on Gavelkind, p. 28, "Peramb."—Perambulation of Kent.

portion of land to a religious house will not alter its tenure." (i)

There are seven Disgavelling Acts, which were passed as follows:—11 Henry VII., 15 Henry VIII., 31 Henry VIII. chap. 3, 2 and 3 Edward VI., 1 Elizabeth, 8 Elizabeth, and 21 James I.

Of these, only one, viz., 31 Hen. VIII., is contained in the Statute Books, and this is consequently the only one that is judicially noticed, for, having been printed in the Statute Book by the king's printer, a copy may be read in evidence to a jury as being a true copy. When the others are used in court an attested copy examined with the record ought to be given in evidence. These Disgavelling Acts, it may be as well to notice, deal only with the custom of descent, which it is that constitutes gavelkind. The other customs, which I have enumerated above, are left untouched by the Acts, since they are only collateral to gavelkind, and rest, therefore, on their own proof. It may also be well to notice that the right of representation exists in gavelkind, so that a daughter will succeed in her father's place if he leaves no son.

A list of the persons whose lands have been disgavelled by the above Acts, and particulars about the lands will be found in Robinson pp. 39, 40, and chapter xvi. of Elton's *Tenures of Kent*.

Of the special customs which I have already enumerated, I need not say more than that, to the present day, the infant tenant in gavelkind can alienate his lands at the age of fifteen by what is called a feoffment with livery of seisin (to be described presently), and that as gavel-

kind was not originally a feudal tenure, tenants in gavelkind could alienate their lands as a matter of right, on securing the rent and services to the lord, at a time when other tenants could not alienate at all without the lord's permission.

Gavelkind is, as we have seen, the free socage tenure of land which is now the common law of the county Kent only, but which, before the Conquest, was the common law of England, and it is expressly preserved by 12 Car. II., ch., 24, with Frankalmoin and grand serjeanty, which I have already noticed, and copyhold, which I shall describe in the next article.

Copyhold, I may mention here, is essentially distinct from gavelkind, or the ordinary free socage with primogeniture grafted on it as a feudal incident, which elsewhere exists, in this, that it is of a servile nature, having been originally either pure villainage, or what was called villain socage. Copyholders, as we shall see, are, in theory, but tenants at the will of the lord. No doubt the will of the lord is now, and has for centuries past, been so governed by custom, that they have practically all the advantages of freeholders, but to understand the nature of this kind of tenure it is necessary to understand something of the social state from which it sprang. Thus, to quote the late Mr. Joshua Williams, "One of the great difficulties of the student of the English Law of Real Property is the number of systems of law he has to master. Having learnt all about estates in freeholds, he finds, when he comes to copyholds, he has to learn a number of *quasi estates*, not the same in every respect but generally similar. If it were possible to get rid of copyholds the law of real property would be greatly simplified." (k)

(To be continued.)

A YEAR'S BUILDING IN LONDON.

A MERE catalogue of the new work that has been done in London during 1898 would occupy many pages. The year has been one of considerable activity in the building world, for in addition to the normal, perhaps more than normal, enlargement of the metropolis—an enlargement equivalent to the addition of a fair-sized town every year—the number of new public buildings has been greater than usual.

Free Libraries have been built in Hoxton and St. George's-in-the-East, baths and wash-houses at Deptford and Walworth, polytechnics and technical institutes at Stratford and Southwark. The large Coborn Foundation School for Girls has been erected in the Bow Road, and a Training College for Lay Helpers in Stepney. Nearly a dozen large Board and Church Schools have been built during the year. From the numbers of new theatres and music-halls that have sprung up, it would seem that London is at least as anxious to be amused as to be educated. Foremost amongst these is Mr. Tree's handsome new theatre in the Haymarket, but in addition there are the Coronet Theatre at Notting Hill, the Princess of Wales' at Kennington, and the Crown Theatre at Peckham, besides variety theatres at Brixton, Shoreditch, and Hammersmith.

The South London Art Gallery at Camberwell, the new offices of the Health Department of the Corporation in Basinghall Street, the third block of the Record Office in Chancery Lane, the new premises of the Institute of Mechanical Engineers at Storey's Gate and of the Institute of Chartered Accountants in Great George Street, are among the more notable public buildings of the year. But perhaps the improvement which has most added to the beauty of the Metropolis has been the pulling down of the old houses in Parliament Street that obstructed the view of Westminster Abbey. On the whole, it may safely be said that the building operations of 1898, though for the most part commonplace enough, have given us a more beautiful—or should we say a less ugly?—city than we had a year ago.

(k) Seisin of the Freehold, p. 48.

A YEAR'S BUILDING IN NEWCASTLE.

LONDON is not the only city which exhibits a rapid and continuous growth in extent and population. There are provincial cities also where the process of growth is quite beyond the normal increase of population. While it may be open to doubt whether the growth of London is altogether a matter for congratulation, whether, in fact, the Metropolis is not far too big already, it is probably true that where a provincial city of moderate proportions draws to itself large numbers of people from the surrounding districts, it may be taken as a sign of the attractiveness of that city as a place of residence, and of its generally prosperous condition. At any rate, for architects, contractors, and all connected with the building trades, a rapidly growing city must be an infinitely more attractive locality than one which exhibits signs of stagnation and decay. We gave last week a report of the state of the building trades during 1898 in several important towns in the North of England. This showed that as a rule trade had been fairly brisk. But Newcastle-on-Tyne seems to be

AN EXCEPTIONALLY FORTUNATE CITY.

Its enlargement during recent years has been phenomenal. Its population has increased from about 175,000 in 1888 to nearly 225,000 at the present time. During last year alone, the increase amounted to about 6000. As a natural consequence, new rows of houses and shops are springing up in every direction. To the westward, nearly all the ground has been built upon, right up to the city's limits. Southward, further extension is barred by the river. At Jesmond, the work that was begun a couple of years ago is nearing completion. The West Jesmond estate is now a flourishing little township, isolated, in a measure, from all the rest of the city. It has fine wide streets and handsome shops. Already, the way across the old stone bridge has been made, and workmen are engaged in the construction of the road connecting the place with North Road and the Town Moor. Houses are still being built, and the workmen were there even upon Boxing Day, getting the roofs on while the weather was fair. West Jesmond will soon have a railway station, a church and a Board school, and the temporary letter boxes that have been placed against the lamp-posts will probably be replaced by an office. The same sort of thing has been going on at the other side of Osborne Road—upon what is known as the Manor House Estate. Where, but a year or two ago, there were green fields with the cattle browsing upon them, and magnificent belts of trees, there are now long streets of houses and shops, and the length of them is still extending. Lower down the valley, the Sandyford estate rivals the West Jesmond estate in prosperity. The houses run almost right down to the Ouseburn, and give warning of an "improvement" that must come sooner or later—the building of an arch over the burn, and the filling in of the valley. At Heaton, Benwell, and Gosforth, many new streets are springing up.

PUBLIC BUILDINGS.

Finally, Newcastle has gained considerably during the past year in the way of public buildings. The list of what has been done and what is being done, in this way, is considerable. In the beginning of the year, it includes the Beech Grove Congregational Church, the Sandyford Road Board School, a Roman Catholic Chapel at Byker, and a new Presbyterian Church at Rye Hill. On May 30, the foundation stone of the new Primitive Methodist Chapel in Northumberland Road was laid, and a handsome building is now well on the way to completion. The foundation stone of St. Gabriel's Church, Heaton, was laid on June 15, and there, also, work is well advanced. A magnificent temperance hotel was inaugurated in West Clayton Street, where formerly a church had stood; and, on Aug. 30, after extensive alterations, the Exchange on the Quay was re-opened for business. A new Presbyterian Church has

been opened at Benwell, and the foundation stone has been laid of the Bond Memorial Wesleyan Chapel, in the same neighbourhood. On Oct. 6, the Victoria Library was opened at Heaton, and only a week or so ago the foundation stone of a new High School for Girls was laid by Earl Grey at Jesmond. These, and others that might be added, make an excellent record of work for a twelvemonth. A good deal of it, still in progress, will be finished during the year that is now beginning, and much more will no doubt be commenced.

Under Discussion.

ELECTRIC LIGHTING.

"Electric Lighting" was the subject before the Edinburgh Architectural Society at their last meeting, when Mr. G. Balfour, of Lowdon Bros., delivered a lecture illustrated with limelight views.—Mr. A. R. Scott occupied the chair.—In his opening remarks Mr. Balfour explained with the aid of diagrams the useful qualities of electricity and how it was adapted for working purposes by the various types of dynamo. Various systems of wiring both for large and small schemes were then described, and in conclusion Mr. Balfour went into the question of precautions to prevent leakage. Some interesting samples and fittings were shown.

THE LONDON WATER QUESTION.

At the meeting of the Victoria Institute last Monday week, Professor E. Hull, LL.D., F.R.S., was in the chair. Many new members were elected, including Professor Virchow and others. Professor Logan Lobley, F.G.S., gave an address on "The Physiography of the Thames Basin," illustrated by diagrams. He pointed out that although the Thames Valley contained the largest population in the world, considering its extent, yet that its physiological characteristics caused it to be at the same time the best watered tract of land. Professor Logan explained a scheme for furnishing every Londoner, even when the population had grown to twenty millions, with a daily supply of thirty gallons. All this water was not to come from Wales, but was to be derived from a series of intercommunicable lakes extending alongside the Thames. In them the water now running to waste in winter time would be stored, and used as wanted. On the top of the necessary embankment the City man, shaded by innumerable trees, would disport himself, it was urged, afoot or on horseback, marvel at the sight of the pretty islands "set in the silver" lakes, and invoke blessings on the heads of the "water authority"—or companies—for the prospect of a supply of water, freed from pollution and microbes by the natural process of settlement. The professor also suggested getting additional water from the chalk under London, and, in conclusion, claimed that his scheme was preferable to that of bringing injuriously 'soft' water from Wales by means of pipes and aqueducts, which might at any moment be ruined by an earthquake or destroyed by invaders.

CARDIFF MUSEUM COMMITTEE.

At the last meeting of the Cardiff Museum Committee, Councillor Ward presiding, Dr. Charles Vachell brought forward a memorial from the Cardiff Naturalists' Society pointing to the advisability of erecting a lecture hall in connection with the new Museum in Cathays Park. Such a lecture hall, to seat 600 persons, could be built for £2500, and the Cardiff Naturalists' Society alone would be prepared to pay £50 a year for the privilege of using it once a fortnight during the winter session. The memorial was inserted in the minutes.—A hearty vote of thanks was accorded to Mr. Robert Drane for the presentation to the Museum of a rare specimen of Swansea china.

HOUSE-PLANNING FROM THE ÆSTHETIC POINT OF VIEW.*

By H. HEATHCOTE STATHAM.

WHEN Mr. Paul Waterhouse read his interesting paper on "Oriels and Bay Windows" before the Association a few weeks ago, he commenced it by praising the judgment and benevolence of the Council of the Association in themselves laying down or suggesting the subject to be treated, thereby setting the reader of the paper a definite task, and encouraging him to acquire some definite information on the subject he had been invited to treat of. And he implied that this was the course now usually pursued by the Association in asking for papers. If that is really the case, why have I been, so to speak, left out in the cold? No such benevolent process of

SELECTION OF A SUBJECT

was exercised on my behalf. I was asked simply to read—"a paper"; the universe being left open to me for choice. The universe is a fine field, but a little embarrassing to select from. Under such conditions, the only course is either to take a subject which you have for some reason or other been led to think about, or—to decline. I do not approve of what may be called "paper-making" for its own sake. If people tell you that they wish for your views on some particular subject, it is another matter. You may give them your views, even if the subject is one not specially interesting to yourself. Otherwise, on two or three occasions when other societies have been complimentary enough to ask me for a paper, I have felt

COMPELLED TO SAY FRANKLY

that there was no subject on which at the moment I had any particular opinions or thoughts which I was anxious to give expression to; therefore I must decline. I recommend my own moral example to others who receive general invitations to read papers on any subject they please. It is a dangerous temptation, and tends to put papers in the same category as after-dinner speeches, where you speak, not because you have got something to say, but because you have got to say something. In one of the finest verses in the Psalms we read:—"While I was musing, the fire burned; then spake I with my tongue": but not till then. If you have

NOTHING TO SAY,

do not be persuaded to say it. And therefore, if the Council of the Association have, as I have gathered, made it a general practice (though unhappily not applied in my own case) to specify the subject when inviting anyone to read a paper, I recommend them to keep up that practice; only I would suggest that, after specifying the subject, a rider should be added—"unless there is any other subject which you specially wish to treat." By tying a man absolutely to one subject you may possibly be preventing him from dealing with another which he would treat better; and if he is willing to dispense with the assistance given by having a definite suggestion made to him, it is probably because the other subject is one that he really cares about. So much for the general ethics of the paper-chase, which are worth a little consideration.

IN THE PRESENT INSTANCE

the request of the Council for a paper happened to reach me at a time when my mind was rather full of a subject on which I had wished, sooner or later, to say something; and, therefore, I could not do better than say it here, thereby complying with your request without falling into the sin of paper-manufacture. Although the architecture of the house cannot, except in the case of such mansions as may be called palaces (which are necessarily somewhat rare), rise to the architectural grandeur of the temple or cathedral, yet there is no branch of Architecture more

fascinating in its interest. It is the most intimately connected of all with the lives and characters of men. In an architectural sense, the designing of a house is not merely the arrangement of rooms so as to be comfortable in themselves and commodious in their relation to one another, though these are points of the greatest practical importance. That is a merely utilitarian view of the problem. The object of Architecture is to transfigure the house from a collection of rooms conveniently arranged, to raise it to the level of a distinct and individual architectural conception or idea which should govern the whole arrangement; to give it as much of interior effect as is compatible with its size and with the practical convenience of internal traffic; to make it something more than a mere dwelling-place; the expression of an artistic thought—whole, complete, and indivisible. Of course it will be said that we take a great deal of trouble to make houses architecturally expressive or picturesque. We have our pilasters, our window pediments, our balustrades, our broken cornices over the doors, and pots on the attics, and cut brick cherubs and garlands; or our gables and roofs cutting into each other in different directions and at different heights, our

SHAM HALF-TIMBERED WALLS,

and coloured rough-cast, and plaster devices, and what not; but all these will not save our souls; a house may have them or not have them, and be neither much the better nor much the worse in either case. The plan is that in which the artistic idea of the house is really embodied; that is the basis of the whole. If there is a good idea in the plan, even bad external detail cannot entirely spoil it; if there is no idea in the plan—nothing beyond a commonplace collocation of rooms in convenient positions—the best exterior detail will do little or nothing to conceal the poverty of the main conception. Of course, in any case, the treatment of the masses of the plan is half the problem; and, as we shall have occasion to notice, there have been splendid plans which have not been made nearly as much of as they might have been in regard to exterior architectural effect; but it is mainly

THE PLAN WHICH DISTINGUISHES

the house which embodies an idea, from that which does not. Now in this respect among others, the mediæval revival, so vaunted at the time, has left an ill influence behind it. To take the ordinary scale of dwelling-house first; it is since the mediæval revival that we have been taught to regard the ordinary-sized dwelling-house plan as consisting merely of the fitting together of so many parallelograms of room-spaces, something like a puzzle map, the end of one abutting on the side of another, the angle of one projecting beyond the wall of another, so as to show where the rooms fit on to each other; the result being a plan that is no shape at all, and which cannot be walled and roofed in under the guise of any formal and

DISTINCT ARCHITECTURAL CONCEPTION.

How can one call that an architectural conception? It is simply some rooms tacked together; it is devoid of internal effect, and externally it can only be treated as an irregular collocation of wall and roofs. This way of building is supposed to be "picturesque" and "truthful"; a house is a collection of rooms, and it is to be treated so; it accords with the irregularity of Nature; and so on. A house is not called upon to accord with the irregularities of Nature any more than a garden; it is an artificial creation, and should be treated as such. If it is a mere collocation of rooms, that is the architect's fault; it ought to something more; it ought to be a

PLAN CONCEIVED AS A WHOLE,

the rooms designed and placed so as to be subordinate to that governing idea while retaining convenience of internal position. That is just the *cruz* of artistic house-planning; the mere irregular fitting of rooms together is an evasion of it. And if we look back at the history of the habitation, we find that after men had emerged from that primi-

tive stage in which, as the soldier sings in "Philip van Artevelde"—

"Two sticks and a mat
Make a very good house."

at a comparatively early period they arrived at the perception that a house should be planned on a centre line, and should have so much of interior architectural effect as space permitted. We may take, for convenience sake, three types as given by Viollet-le-Duc in his "History of the Habitation"; they must not perhaps be taken as quite archaeologically accurate, for Viollet-le-Duc possessed imagination as well as industry, and (like other French archaeologists) what he thought probable he treated as historic fact; but they are probably near enough to fact in their main characteristics. In an Aryan house on the banks of the Upper Indus, a locality which has long been the accepted "cradle of the human race" (though Mr. Traill complains that "they are moving the bassinets about a good deal lately"), a plan is drawn out on a centre line, and with the large outer court and inner hall for family life, which is the precursor of the *atrium* of the Roman house probably through the *'alþjov* or open-air hall of the Greek house. In an Ionian house we have the same centralised system, but the inner rooms have

INCREASED IN IMPORTANCE,

and it is curious to notice on one side what would now be called the "stable wing," much as we see it placed in some of the English eighteenth century mansions. Then we have the Greek house, in which the inner colonnaded hall has become the principal feature, and provides a really fine piece of interior architectural effect in a house of moderate dimensions, and which we find reproduced more or less in the Pompeian house. We cannot in this climate have the open-air colonnaded apartment in the centre, though we can have something like it in the disposition of apartments; but at all events this is a far more artistic conception in house-planning than the first-named plan. I am not arguing necessarily in favour of

BI-LATERAL SYMMETRY

in the average-sized house, though I am inclined to say that in the majority of cases bi-lateral symmetry in the main masses at least (with diversity in some of the details) will produce the best architectural result, more especially in the case of a house which is combined with a garden. We have all learned to recognise of late years the beauty and suitability of the formal garden, differentiating the garden, as a work of art, from the informal lines of Nature; and the formal garden will only go well with the formal house. But apart from the bi-lateral question, at all events we ought to see the house modelled on a distinctly conceived and predominating design which moulds the whole of it; not merely put together as the rooms may fit conveniently. The attempt to do this, as it appears to me, is not often made among us. Occasionally we see such a thoroughly original conception as that house by Mr. Prior, of which the model was exhibited two or three years ago at the Academy. "Cliff Towers," a small house by Mr. Townsend, is noteworthy as an example of a plan and architectural treatment which form a

COMPLETE AND ORIGINAL CONCEPTION;

so is the plan of a house by Mr. Horsley,* with its entertaining rooms and gallery *en suite* on the garden front, forming a much more dignified architectural interior than is generally attained in a house on this scale; and other examples will probably occur to some of my hearers. But in the attempt to give special character and unity of conception and design to houses of average size, both the Americans and the Germans are a good deal in advance of us. I am thankful to say that I cordially hate modern German architectural style and detail for the most part; but in turning over a collection of plans of German houses one is surprised to find what an amount of

* A paper read before the Architectural Association on Friday, January 6th, 1899.

* The plan and elevations of this house will appear in our next issue.—Ed. B.J.

variety and ingenuity are shown in the arrangement of the plan, and how little of the ragged and accidental character which is so often found in English plans; they are almost always laid out in accordance with a leading idea which gives unity to the whole. We have a good deal to learn from the Germans in this matter of house planning on an architectural system; it is when they begin to raise and to decorate the elevations that they make such a terrible business of it. But let us turn now to what, in my own mind, was the main object of this paper, the treatment of plan in the largest class of houses—those which can be dignified by the name of "mansions." It is here especially that the taste fostered by the mediæval revival has injured us. The mediæval mansion was in the first instance the castle, and the castle and the habitable portions included in it were naturally built with what we now call a "picturesque irregularity"; which

WAS NOT PICTURESQUE

in the eyes of those who built the castles, but simply utilitarian. Castles were usually, or one might say always, built in as commanding and as isolated a position as could be selected, to secure them the better against attack by force or by surprise. The plateau on which they were built was often irregular in shape, and the most was made of it; after the castle had expanded to something beyond the mere "keep" or single tower, the outer wall followed the natural line of the high ground, and the habitable buildings were got in where it was most convenient and where they were safest. It was only when the times became a little quieter and more civilised that castles or châteaux began to assume regular forms uninfluenced by the nature of the site. The change in progress in the plan of the Château of Chambord, where the inner and outer blocks with their angle towers are quite symmetrical in disposition, but internally the circular towers are cut up by partitions in a quite irregular manner, is noticeable; they are still purely military and utilitarian towers, their circular shape having no reference to any object but their engineering suitability as angle defences. With the commencement of the Renaissance period, when architects had become familiarised with the symmetrical temple buildings of the Romans, came the age of the great

SYMMETRICALLY-PLANNED MANSION,

first in the Elizabethan form of the courtyard or quadrangle, next in the later Renaissance form of the main central block and the outlying "wings." Later in the Georgian period the wings disappeared, and the symmetrical block alone remained; the accessory buildings, such as stables, laundries, &c., no longer forming any portion of the main design, but being relegated to separate buildings at more or less distance from the house. Then after the Gothic revival came the idea that symmetry was not picturesque; there was a reaction against the formal plan, and then followed the taste for what I call the rambling plan, in which the object apparently was to make it appear as if the plan had grown up by accident, or had arisen from the gradual enlargement of the house by successive additions. This habit of deliberately planning a house to look accidental and picturesque is, like the twisting walks and

QUASI-NATURAL PLANTATIONS

of the landscape gardener, an entirely modern invention. For houses of the largest class, there is no precedent for it in any previous age. The irregular castellated dwellings of the mediæval period, as already observed, were irregular for merely utilitarian reasons—to suit the site and make the most of it. There are various old houses in the country which have arrived at picturesque irregularity by dint of successive additions and alterations, but I think there are few if any that were deliberately built so, without anything in the nature of the ground to suggest such a treatment. It is a modern fancy engendered by the Mediæval Revival, and in its adoption has robbed us of the most impressive architectural qualities which are possible in a great mansion.

(To be continued.)

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

January 11th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

GOOD progress is being made with the rebuilding of the Metropolitan Tabernacle. The lower hall was opened for public worship on New Year's day. The hall has a fireproof ceiling which will form the floor of the auditorium. The latter will be different in some respects from the old auditorium in which C. H. Spurgeon preached for so many years. It will be shorter by about 18ft., the adjoining offices will be larger, the seats will be less crowded and more space will be left in the aisles. These alterations will lessen the seating accommodation of the place by about 1000. As may be supposed, the greatest possible precautions will be taken against the recurrence of the disaster of last April. The building will have an iron roof, the galleries will be concrete and iron, and there will be an abundant supply of fire hydrants. The total cost will be about £32,550. The architects are Mr. Pocock, who planned the original building, and Messrs. Searle and Hayes, and the work will be carried out by Messrs. Higgs and Hill, Limited, under the personal supervision of Mr. William Higgs, the son of the builder of the old Tabernacle. It is anticipated that the whole structure will be completed in about eighteen months.

ON Monday, Jan. 2nd, the South London tramway system passed into the hands of the London County Council. The price paid by the Council, as fixed by the arbitrator, was £850,000. Until the new manager (Mr. Baker, of Nottingham) is able to take charge, the trams will be managed by a committee. At present there will not be any change in the fares. The energies of the Council will probably be directed towards increasing the efficiency of the service, doubling and lengthening lines, putting on all-night trams, and installing an electric system. Nearly 1900 persons are added to the staff of the Council. The stud of horses numbers 3850. The net profits for last year were £85,000. Half will be absorbed by interest on purchase money, and by the sinking fund for repayment, which extends over two periods of thirty and sixty years. The introduction of electric traction will, of course, involve a large expenditure, but it should greatly improve the system, which will, no doubt, in the future prove to be a valuable municipal asset.

THE question of the alleged shirking on the part of bricklayers, which results in a smaller output of work per man, and consequently increased cost of building, is again being discussed. From the opinions of a number of representative men, which have been

obtained by our contemporary, the Municipal Journal and London, it is quite clear that the number of bricks a man will lay in a day is considerably less than it was a few years ago. Even the workmen's representatives admit that. As to whether the quality of the work has improved different opinions are expressed. Mr. H. R. Taylor, the bricklayers' representative on the County Council, says that: "It is quite true that bricklayers do not lay so many bricks as they did, and they never will again, because the system of work is so entirely different from what it used to be, and men never scamp it." Mr. Rowland Plumble, F.R.I.B.A., the well-known architect, says: "I am distinctly of opinion that bricklayers' work in contract work is better done than it used to be. The men are more independent, and will not be driven." The secretary of the East End Dwellings Company thinks "there never was a time when, on the whole, better work was done than now." Mr. Henry Holloway, on the other hand, declares that not only is the number of bricks a man will lay reduced to about 400 a day, but the average quality of the work is inferior.

THE year which has just ended has been by no means lacking in events of artistic importance and its record is in many ways of more than ordinary interest, says the Globe. Against the continued slackening in the demand for easel pictures of importance, an encouraging increase in the appreciation of decorative work, and especially of sculpture, is to be recorded. Under the influence of this comparatively new encouragement, our sculptors are doing themselves justice. Such work as was contributed last spring to the Academy by Mr. Brock, Mr. Pomeroy, Mr. Frampton, Mr. Drury, Mr. Goscombe John, Mr. Fehr, Mr. Cowell, and Mr. Stirling Lee, is worthy of all praise; and in a review of what has been accomplished during the year no fact is more deserving of attention than the all-round excellence of the performances of this group of artists. For them the year has been a notable one, not only on account of the work they have completed, but also because it has brought them many important commissions. Mr. Brock, for instance, has on hand, besides the great equestrian statue for Leeds, the memorial to Lord Leighton for St. Paul's Cathedral, and the statue of Mr. Gladstone for Westminster Abbey; Mr. Pomeroy has to execute the statue of Mr. Gladstone for the Houses of Parliament; Mr. Fehr and Mr. Drury are both busy with works which are also to be erected at Leeds; Mr. Frampton has been chosen as the sculptor of the great statue of the Queen for Calcutta; and Mr. Stirling Lee has a further series of the bas-reliefs for the St. George's Hall at Liverpool to complete. The Glasgow Art Gallery, too, is occupying the attention of several of our younger sculptors, who are, under Mr. Frampton's supervision, to decorate the exterior of the building.

ANOTHER branch of decorative art has received practical recognition at Glasgow, for Messrs. Lavery, Roche, George Henry, and E. A. Walton have been chosen to execute the mural paintings in the dining hall of the Municipal Building. In London the more important additions to the list of painted decorations have been the panels by Mr. Seymour Lucas and Mr. Goetze, in the ambulatory of the Royal Exchange; a couple of large lunettes in coloured plaster relief, by Mr. Fehr, for the library of the West Ham Institute; and a series of panels in the same material, by Mr. Gerald Moira and Mr. F. Lynn Jenkins, for another library. The world has lost during the year two great artists, whose influence upon contemporary Art has been strongly felt—Burne-Jones and Puvis de Chavannes. The death-roll of the year also includes Henry Stacey Marks, P. H. Calderon, Charles Green, W. H. Overend, and that eccentric genius, Aubrey Beardsley.

THE Chiswick authorities may be entirely devoted to the public interest, but their method of showing their devotion is hardly precipitate. It is seven years since they obtained a pro-

visional order for electric lighting, but the electric light appears to be as far off as ever. Meantime the "option" has passed into different hands at least four times, its value on the third exchange standing at about £2000, and at £5000 on the last. One agent who acted as "introducer" between the first holders of the option and the second claimed a commission of £100, of which he had only received £25, and he brought the case a few days ago before the Westminster County Court, where it still awaits the attendance of further witnesses. The evidence so far reveals the usual shameful amount of possible intrigue in the allotment of contracts, and the usual dangerous opportunities for public representatives to abuse their position as long as the contract system lasts.

THE London County Council has just taken over from the contractor another block of dwelling-houses on the Boundary Street Estate, Shoreditch, the seventeenth of the 23 blocks it is proposed to erect. There were 500 applicants for the tenements in the new block, but only 120 can be accepted. The new dwellings, says the Standard, have an agreeable architectural appearance, having a touch of Tudor London about them, with tiers of bays and balconies running round. The latest developments of sanitary science have been applied, and the home comforts of the incoming tenants studied. All the drainage is carried outside the tenements by iron pipes to the sewers, and the tenants are provided with galvanised iron dust-bins in the yard, and galvanised iron pails. The County Council are supplying their own gas to the new dwellings at a moderate charge. All the rooms are provided with picture rails, and trees and shrubs are planted in ground round the building. The tenants have a club, which is managed entirely by themselves, in which concerts and dancing take place. There is also a central laundry, and hot and cold baths are provided at a nominal charge. The average rent per room of the Council's tenements is 2s. 6d. per week.

THE Colonial Office is undergoing a much-needed renovation. This has been in progress for some little time, but another month or so is expected to elapse before the building is out of the hands of the painters and other workmen. The principal offices and corridors have already been operated upon, and look fresh and bright in the various tints of green in which the walls have been painted. Electricians are also at work completing the connections for extending the system of electric lighting to the whole building. A special feature in the improvements is to be the decoration of the handsome and spacious entrance hall. No scheme of decoration has as yet been definitely decided upon, but in the first instance experiments are being made with a view to discovering the style of decoration best calculated to bring out the architectural beauties of the hall. Some of the panels on the ceiling are consequently receiving a trial painting, and the same process is being applied in the case of arched recesses along the wall facing the entrance from the quadrangle.

SPEAKING at Malmesbury the other day, the Bishop of Bristol stated that Malmesbury was one of the earliest stations of the Ancient British Church, and that the British Bishops and monks held sway there until the seventh century. Early in Anglo-Saxon times the Latin language was first taught to the English there, and, under the great scholar Aldhelm, Malmesbury Abbey became a great educational institution. Aldhelm subsequently became first Bishop of Sherborne, when the huge diocese of Wessex was divided. Of the nine bays of the nave in Malmesbury Abbey, six are in use as a parish church and three are in ruins; the central tower is also a ruin. It is proposed to raise £5000 to repair and improve the section in use, and a like sum to prevent the ruined-ports from falling into further decay. It would require at least £10,000 to rebuild the three ruined bays, and the Bishop did not advise that that should be undertaken.

AT Leeds the annual exhibition of works executed by students of the School of Art, comprising drawings and paintings from the antique, still life, and the living model, modelling in clay from life, architectural designs, and drawings from measurement, and designs for various work of a decorative and industrial nature, has just taken place. There were also specimens of work done in the wood-carving class, drawings of technical details by students in the building construction department, and a number of highly creditable designs by pupils in the Girls' Modern School. An interesting portion of the exhibition was a case containing a few specimens of work executed in the recently established class for bookbinders, which showed that the work of the pupils in various stages of the binding of books was thorough as regards craftsmanship, and aimed at producing work of an artistic nature. The exhibition was of a varied and interesting nature, and the work generally of good quality.

HOLY TRINITY, Minorities, is about to be amalgamated with the Church of St. Botolph, Aldgate. The church possesses not a little historic interest. It dates back, indeed, to the year 1293, when an abbey for the nuns of the order of St. Clare was founded by the Earl of Lancaster, the brother of Edward I. At the time of the dissolution of the monasteries by Henry VIII. the abbey became the church of the parish, and since then it has continued as such. The present building, however, only dates from the year 1706, as, although the church escaped the Great Fire, the edifice had become in such a dilapidated condition at the commencement of the eighteenth century that its absolute reconstruction was rendered a necessity.

THERE is no doubt that the electric lighting system of the City of London Electric Lighting Company is most inefficient, frequently needing to be supplemented by candle or lamp. In the case of gas companies, when the light falls below a certain illuminating standard they render themselves liable to a legal penalty, and this regulation should apply to electric lighting companies also. Replying to a recent letter, signed by many tenants of 162, Queen Victoria Street, complaining of the inconstant supply of energy at a standard pressure, and the exorbitant price charged for the light, Mr. J. C. Bull, the manager of the City of London Electric Light Company Limited, admits that the Company is bound to give a constant supply at a standard pressure, but asks for the indulgence of customers in the position in which the Company has been placed owing to the delay on the part of the manufacturers to complete the additional plant by the contract date. Referring to the question of price, Mr. Bull says the Company will be pleased to discuss the matter fully with customers.

COMPARED with most foreign and provincial towns, London is badly lighted, for the electric light and the incandescent gas which have been utilised of recent years in some parts of the town are only sufficient to give a hint of better things that might be. It is not so bad when all the shops are open and lighted, but if one really wishes to see how London is lighted, he has only to walk about the streets on a Sunday evening, when the gloominess of the capital must strike even the most careless observer. Electric lamps are rare, and the gas jets but give a dim, yellow radiance, which makes the gloom even more apparent.

It is stated that the destruction of one of the finest views on the Thames is now threatened by the erection of a wall over 10ft. high, running for fully half a mile on the Surrey side of Molesey Reach. The Daily Mail says this ugly structure will cut off one of the loveliest prospects near Hampton Court. More than an eighth of a mile of the wall has been already built above Molesey Lock, and the intention of the Lambeth Water Company, which is putting it up, is to continue the wall in a westerly direction close to the edge of the river. Not only is the Lambeth Water Com-

pany continuing the erection of this wall, but many hundreds of beautiful trees, including numerous old and handsome willows, are being cut down. The whole of the land on the Surrey side is being cleared, and the simple character of the landscape will be ruined. The celebrated view of the Thames at Molesey Reach, will, when this wall is completed, be no more.

WHAT the authorities at East Molesey now demand is that the Lambeth Water Company at least relieve the ugliness of the structure with some show of ornamentation. The appropriation of Thames sites for waterworks purposes began some years ago, when the Southwark, Grand Junction, and Vauxhall Water Companies erected their present structures. The Grand Junction pumping station on the Middlesex side of the river is a good example of what modern engineers can do when they desire. There you see many trees still standing. They have been wisely utilised to screen many of the less attractive buildings. The retaining walls and even the great smoke stacks are partially obscured by the natural wood. The same care would have at least modified the ugliness of the Lambeth Water Company's wall. Instead of a sheer brick structure, an ornamental embankment could have been thrown up. This could have been sloped off, covered with grass, and a little ingenuity on the part of an ordinary landscape gardener could have transformed it into a flower bed. It would not have required much care to have made it quite beautiful. The officials of the Molesey Board of Works have had many complaints about the hideous structure, and have adopted a resolution requesting the waterworks company to plant willows along the wall, or do something to relieve its present ugliness.

BELL-HANGING and tuning is an important business in this country, where most churches can boast of a peal. A large number of these instruments come from Whitechapel, where the "Jubilee" peal for a church in Devonshire was recently cast, on which can be seen a portrait of her Majesty, with the dates 1837-1897, and a suitable inscription clear enough in the swelling side of the bell. The tuning is performed by men chipping little pieces of metal off the sides. Big Ben is, of course, the largest bell in England, weighing over 13½ tons. This was cast at Whitechapel. Great Peter of York (10½ tons), Great Tom of Lincoln (nearly 5½ tons), Dunstan of Canterbury (3½ tons), and the peal in the tower of the Royal Exchange were all turned out at the same place.

CULLODEN HOUSE, with its historic associations, has just been let on lease to Mrs. Thomson Sinclair, at present lessee of Dunbeath Castle, Caithness. This old Highland mansion-house was, some eighteen months ago, entirely dismantled of its rare and unique Jacobite treasures, which were the pride of the Culloden family for generations. The house has recently been put into thorough repair.

ON the subject of "Old Dundee," Mr. A. H. Millar lectured recently to the members and friends of the Dundee Burns Society. In the course of his remarks, Mr. Millar explained how the streets had been formed from the old wynds, the lanes from the ancient closes, and how the city had emerged from the primary form it necessarily took from topographical and defensive peculiarities. The Nethorgait he traced back to the old Fleuchargait, and similarly the earlier origin of Murraygait, Seagait, and High Street was described, especially interesting being historical incidents relating to the civic life of a bygone time. The kirks in the form they appeared after the great fire of 1841 and the old steeple formed the subject of description, and Mr. Millar narrated the data which tended to show the probable date of erection. Passing on to speak of the modern city, with special reference to its architectural aspects, the lecturer instanced Albert Square as affording examples of widely divergent types. During the past fifty years an immense

development, as indicated by modern buildings, had taken place. The quasi-Gothic style as applied to Church Architecture about 1840, and the florid Gothic as shown by Sir G. Gilbert Scott in the Albert Institute, were prominent types, and examples were also displayed of Grecian, Flemish, French Renaissance, and Tudor styles, and also of that inexplicable abortion which might be called the nineteenth century atrocity. In Dundee ideas were so much enlarged—and debased—that within the compass of Albert Square specimens of nearly all these widely divergent styles might be seen, each proprietor erecting his dwelling or public building with a supreme contempt for his next-door neighbour, making thereby a curious jumble of incongruities. One of the best sites in the city was occupied by a nondescript Post Office, erected under contract for a highly cultured Government, but which a merciful Providence was now removing.

THE Russian monument which the Grand Duke Nicholas has just inaugurated near San Stefano, has been erected over the crypt in which the Russian soldiers who fell during the war of 1877-8 are entombed. It stands in a square enclosure of about six acres, surrounded by a crenulated wall with a tower in each corner. The monument is built of grey porphyritic granite (rough dressed) with embellishments of white French stone. Over the main entrance is a painting of Christ, with one of Vladimir on one side and Alexander Newsky on the other. The basement contains the ossuary, the church standing immediately over this. Above is the chapel, which is surmounted by the campanile, which is itself surmounted by the spire. The works were begun in 1883, under Colonel Peshkoff's supervision, and he is also the designer of the monument. The enclosure is being laid out as a garden.

THE REV. PROFESSOR COOPER, who presided at a recent meeting of the Aberdeen Ecclesiological Society, referred to the present position of the Greyfriars' Church question. The Gothic Architecture of England had quite come to an end by the time that Greyfriars was built, but the Gothic Architecture of the north of Scotland was still showing considerable vigour and originality, and he did not know that any fragment that had come down to us of the late northern Gothic Architecture was so fine and majestic as the west front of Greyfriars. It had been said that St. Mary's Chapel was hopelessly lost. But it had been beautifully restored, and now looked older than it did in its unrestored state. They could not but regret that their ancestors of 1836 took down the East Church, and it would be an equal calamity if Greyfriars were removed. He hoped that, on architectural grounds, on grounds of antiquity, and on grounds of association, these were the opinions that would be held by members of the Town Council. He was perfectly certain that, whatever might be the opinion of those who had studied the subject from an architectural point of view, violence would be done to the feelings of many of those who were well qualified to judge if the proposal to retain the church should unhappily miscarry.

It is proposed to very largely increase the accommodation at St. John's Training College, Battersea, which is in the hands of the National Society. The new buildings would enable the college to provide for 125 students and the necessary staff. The expenditure involved will amount to over £8000.

THE exhibition of drawings by students of the Bolt Court Technical School—one of the schools carried on under the auspices of the London County Council Technical Education Board—was closed on Saturday. The object of the school is to give instruction in the craft of producing surfaces for printing. The instruction comprises drawing, design, lettering, lithography, photographic copying, and the chief photo-mechanical processes. While essentially technical, the school does not overlook the more artistic side of the work, and both departments were copiously represented

in the show, which contained examples of the work of three months. With designs for posters, magazine covers, and so forth, there are exhibited various interesting sketches in black and white and in colour, life and costume drawings, and landscape effects. The work is done mainly from models in the school studio, but opportunities are also afforded for outdoor practice, and the results displayed on the walls were in many cases highly satisfactory. Messrs. John Swan and Co., photo-engravers, offered money prizes for drawings suitable for advertising photo-process work, and these evoked a keen contest, some of the productions being of considerable merit.

BARON DE FERRIÈRES is giving £1000 towards providing an Art gallery in connection with the public library at Cheltenham. The Town Council have decided in favour of acquiring some adjoining cottage property at about £850, and as the unexhausted borrowing powers of the library to the amount of £650 can be ill afforded, in any event to borrow a sum not exceeding £1500. Application is to be made to the Local Government Board for sanction to borrow such a loan, and appropriation of land adjoining the public library for the purposes of the museum as soon as the provisional contracts are executed.

THE boring into the coral reef or atoll of Funafuti has been discontinued on reaching a depth of 1114ft., the material traversed being described as "coral reef rock." Previous information showed that for nearly 600ft. the boring had passed through calcareous rock, varying from a sand composed of nullipores, foraminifera, broken shells, and corals, to beds of reef coral, but that it had then become much harder owing to predominance of the last-named, so that for more than 500ft. the tool seems to have been piercing a continuous reef. The scientific value of these results can hardly be over-estimated, and not a few persons will be surprised that some other kind of rock, such as volcanic, did not make its appearance at about 850ft., for at that depth the exterior face of the atoll changes from almost a precipice to a slope of about 30 degrees, which, after a time, becomes more gentle, till the ocean floor is reached at a depth of about 12,000ft.

THE Dürer Society, which was inaugurated in the early part of last year, has been obliged to make a change in its committee, owing to the lamented death of Mr. Gleeson White, who, since its formation, has been one of the most prominent of the society's members. To fill his place on the committee was no easy task, but the society has been fortunate in securing the director of the National Portrait Gallery—Mr. Lionel Cust—who has kindly offered his services. It is difficult to conceive a happier choice, for Mr. Cust is, of course, an expert in all matters artistic, and unites sincere feeling with thorough technical knowledge.

THE French Minister of Public Instruction has presented to the trustees of the British Museum a life-size cast of a bronze statue of a youthful charioteer, the original of which was recently unearthed in the course of the excavations carried on with so much enterprise and success by French archaeologists on the site of Delphi. To this site their enlightened labours have imparted a suggestion of the natural and acquired splendours of the place at the period, B.C. 480, when the treasures of the Temple attracted the cupidity of the Persian despot, Xerxes. The statue is, in accordance with the ruling conventions of the art of the place and the time of its production—say 482–472 B.C., dressed as a woman, so that the only parts of the actual form available for artistic treatment are the head and neck, the arms, and the feet and ankles, which are uncovered. But those parts are so remarkably lifelike that the statue may be regarded as a fine example of the early period of Greek Art.

MUCH dissatisfaction is felt among Birmingham architects with the arrangements made in connection with the proposed new

public buildings. A resolution has been forwarded to the Lord Mayor by the Birmingham Architectural Association expressing regret that the proposals made by the general Purposes Committee to the City Council seem to imply that the resolution of the City Council, directing that works to cost upwards of £10,000 shall be submitted to architectural competition, is to be departed from. Should, however, it be determined to dispense with competition, the Association expresses a hope that, as the proposed new buildings will occupy so prominent a position, and be used for public as well as artistic purposes, the greatest care will be exercised in the selection of an architect, who, from his experience and works, may be trusted to produce a building which will not only be thoroughly suitable and convenient in its plan and arrangement, but will also be of decided architectural merit and an artistic ornament to the city.

THE Peabody Trustees have been obliged to raise the rents of their tenants—or rather of about two-thirds of them—on account of the increase of rates and the large expenditure they have recently been put to in making repairs and carrying out sanitary arrangements. The amount of increase amounts to about 4d. per tenant, or 1½d. per room. The change has caused a good deal of discontent, but the rents will still be low, as London rents go, averaging only about 2s. 3d. per room. The total amount given by the late Mr. Peabody for erecting dwellings for the working classes was £500,000, to which has been added for rent and interest £720,466, making the total fund to the end of last year £1,220,446; the total expenditure on land and buildings was £1,250,390. During 1897 £12,232 was spent on drainage, structural alterations, and sanitary improvements, and the net gain of the year from rents and interest was £32,320. The sum of £85,000 was advanced to the trustees by the Bank of England, and of that amount £53,500 has been repaid. The number of people housed at the end of December last year was 19,741 in 5121 separate dwellings and 11,367 rooms, namely, 86 dwellings of four rooms, 1781 of three rooms, 2426 of two rooms, and 828 of one room.

A CO-OPERATIVE glass factory was founded at Albi during a strike at Carmaux. The founders started with a capital of £6000, £4000 of which was furnished by an old lady out of her savings. Subscriptions from divers sources made up the rest. The enterprise, which has not met with anything like the success that has often attended co-operative undertakings in England, was soon in distress. The Town Council of Albi gave its assistance by a gift of £1000, but the Méline Government cancelled the vote. The other day that sum was reduced by a half. M. Dupuy has not objected, "hoping to pacify, and for the sake of social humanity." But he is sorry the enterprise must be propped up, and that one way or another it does not give satisfaction. The operatives complain that the Committee of Management are the hardest taskmasters they ever had to deal with, and the unaided factories in the district cry out against the co-operative one as living at the expense of the ratepayers.

AN exhibition of work done by the students at the Birkbeck School of Art was held last week at the school in Chancery Lane. The exhibition includes the drawings and paintings submitted for the national competition in May last, and sketches and studies by the members of the sketching club, which is also connected with the Institution. The specimens of woodcarving afford evidence of much skill and taste, while the designing and staining on wood and the modelling in clay are highly commendable. Though the majority of the exhibits are of a technical character, the gallery contains many excellent life studies. The number of students at present attending the school is 304, and the record of their recent successes is highly satisfactory.

KEYSTONES.

A NEW vehicular traffic bridge over the railway is to be erected at Filey.

CAROLUS DURAN, the famous French painter, will shortly return to the United States.

EXTENSIVE and long needed alterations are shortly to be begun at Ludgate Hill Railway Station.

A SCHEME for an electric tramway has been approved by the Dewsbury Town Council, and is estimated to cost £19,750.

WE are informed that Messrs. T. W. Newton and Cheate, architects and surveyors, have removed to 39, Newhall Street, Birmingham.

DR. TILTON, of Dursley, has left £500 to the churchwardens for the repair or beautifying of the church.

AN effort is being made in Bristol to build a Church Missionary House, with a hall to accommodate 250 persons.

THE memorial stone of the Gordon College at Khartoum was laid by Lord Cromer in the name of the Queen on the 5th January.

IT is hoped this year to effect the restoration of the west front of Bath Abbey with its so-called Jacob's Ladder sculptured in stone.

DURING the eleven years of his pastorate the Vicar of Barmouth has raised £52,000 for Church building, and now he wants a parochial hall.

LORD LEIGH, Lord Lieutenant of Warwick, on the occasion of his Golden Wedding, has been presented with his portrait, painted by Mr. Oulless.

AN exhibition and sale of the pictures of Mr. Henry T. Wyse, art master in the High School at Arbroath, is being held in the Public Hall of that town.

THE large and handsome hall erected at a cost of £3000 by the Peckham Liberal Club at the rear of their commodious new premises in Elm Grove has just been opened.

A NEW Municipal Technical College, erected by the Corporation of Derby at a cost of £10,000, is to be opened by the Duke of Devonshire on January 19th.

THE beautiful new chancel stalls designed by Mr. Sedding, of Plymouth, for St. Mary's Church have just been dedicated. They are of oak, and are very elaborate in their design.

SIR CHAS. F. HAMOND, M.P., has presented a portrait of himself, painted by R. E. Rud-dock, to his brother justices at Newcastle Police Court for hanging in the magistrates' room.

THE County Council for Eastern Perthshire has decided to defer the question of a new bridge over the Isla at Bermondry, pending the preparation of a plan and statement as to the probable cost.

THE DUCHESS OF BEAUFORT is endeavouring to raise funds for a new reredos in Bristol Cathedral as a memorial of the thirty-four years tenure of the united Sees of Gloucester and Bristol by Dr. Ellicott.

IT is proposed to begin the erection of a new Congregational chapel at Seaforth this year. Last year over £1000 was raised towards this object, and it is intended to raise a similar amount during 1899.

MR. JOHN ALDWORTH has been appointed manager of the Nottingham tramways in succession to Mr. Baker, who comes to London to take charge of the South London system just taken over by the London County Council.

THE building presented by Sir Henry Harben to the Hampstead Vestry for the accommodation of the books in the Public Lending Library has been opened. The premises are in Arkwright Road, and have cost £5000 to erect.

A NEW drill hall, for the use of the F. and G. Companies of the 1st Durham Royal Engineer Volunteers, was opened at Gateshead on the 30th December. The contractor is Mr. J. Ross, Gateshead, and the cost of the work was about £2500.

A LICENSE for the performance of stage plays has been granted to the managers of the new theatre at Doncaster, a further application for a license to sell intoxicating liquors being refused. The new theatre, which will be opened in February, will accommodate about 1500 people. It is proposed to utilise the site of the old theatre for municipal improvements.

THE Princess Louise, accompanied by the Marquess of Lorne, has consented to distribute the prizes to the students of the Royal Female School of Art at Mercers' Hall on Tuesday, the 17th inst.

LORD PIRBRIGHT has decided to erect at Pirbright, adjoining the fountain which he presented to the village in commemoration of Her Majesty's Jubilee, a spacious hall for the use and recreation of the inhabitants.

A PROPOSAL has been started to place in the newly-restored church of St. Saviour's, South-wark, a stained-glass window to the memory of that sturdy Nonconformist, John Bunyan, author of the immortal allegory, "The Pilgrim's Progress."

BURNTISLAND has had its full share in the prosperity that seems to have pretty generally attended the building trade during 1898. The chief work of the year has been that done in connection with the new dock works, at which 350 men are now employed.

A PARLIAMENTARY BILL will be introduced during the ensuing session for the provision of a water-power electrical generating station or stations at Loch Leven. It is proposed to incorporate and confer the necessary powers on the Highland Water Company.

A CLOCK-TOWER has been erected at Wolverhampton as a memorial to the late Mr. John Lysaght, a well-known ironmaster, of Bristol and Wolverhampton. The funds were raised by the men in the employ of Mr. Lysaght at his ironworks in Wolverhampton.

THE Engineer to the Works Committee of Dundee Harbour Trust has, in consequence of the recent case of drowning at the docks, been instructed to make inquiries as to the advisableness of introducing the electric light, and report as to the probable cost of the installation.

NOT for twenty years has the building trade in Montrose been so busy as during the past year. The Highland Esk Distillery and the Inglis Memorial Hall, Edzell, are the most important new buildings, but in addition a great deal of villa and cottage building has been going on.

A MEETING of ratepayers and property owners held at the Wakefield Town Hall has unanimously approved the promotion by the Corporation of a parliamentary Bill with the objects of adding Alverthorpe to Wakefield, extending the waterworks, and making other improvements.

THE Marquis of Aylesbury has undertaken to defray the cost of removing the historic Brudenell Monument—one of the oldest in Buckinghamshire—from the old to the new church at Stoke Mandeville in that county. By this timely action the monument is saved from threatened destruction.

SIR FRANCIS S. POWELL, M.P., has presented a site for the new church which it is proposed to build in the Chapel Green district of West Bowling, Bradford. The new church will replace a mission church. It is to provide accommodation for 500 persons, and the estimated cost is £8000.

WIGGANTHORPE HALL, Malton, the residence of the Hon W. H. and Lady Mary Fitzwilliam, sustained serious damage by a fire that broke out on the 4th January. Three or four rooms in the old wing of the hall were gutted and their contents destroyed. The amount of damage is estimated at nearly £3000.

OWING to the bursting of a sewer the works at the new Orleans Railway Station in Paris were suddenly flooded, the workmen having to leave hurriedly. Operations will not be able to be resumed till next week, and it is feared that all the masonry work, which was nearly completed, will have to be begun afresh.

THE death of Mr. Thomas Letherbrow occurred last Tuesday week. He was widely known in Manchester as an accomplished draughtsman, and produced many etchings of merit. Mr. Letherbrow had the command, also, of a graceful pen, and his writings evinced a cultivated taste. For some years he held the office of treasurer to the Lancashire and Cheshire Antiquarian Society. His most important writings are the biographical monographs on his artist friends George Crozier, F. J. Shields, William Hull, and Warwick Brookes.

A NEW Club and Institute has been opened at Penshurst, Kent. The club, which is substantially built of local sandstone, consists of a hall for public meetings, a billiard room, coffee bar, club and reading rooms, bath room, &c. The entire cost is borne by Mr. Arnold F. Hills, of the Thames Iron Works, London.

A NEW church, to be called the Church of St. Paul, is to be erected in that portion of the Fairhaven Estate which falls within the parish of Lytham. Mr. Clifton, of Lytham Hall, has given a site, valued at £1400, for a church, school, and parsonage, and he proposed to add an endowment of £100 per annum for the new benefice.

ALNWICK CASTLE, where the Duke of Northumberland died, is a venerable and majestic pile, rearing its head proudly above the banks of the Alne, some thirty miles from the Scottish border. Its most prominent architectural feature is the Prudhoe Tower, erected by the fourth duke, "the good Duke Algonson."

THE Royal Sea-Bathing Infirmary at Margate is open, after having been closed for several months, consequent on the entire re-modelling of the sanitary arrangements. The total cost of the alteration is about £10,000. The Treasurer (Mr. M. Biddulph, M.P.) will gladly receive contributions at the offices, 30, Charing Cross.

A MONUMENT is about to be erected to the memory of Bossuet, in the Cathedral of Meaux, in which he preached some of his noblest sermons. It will be remembered that it was Bossuet who preached the famous funeral oration over the remains of Henrietta Anne, Duchess of Orleans, the unfortunate daughter of Charles the First.

A PROPOSAL is on foot to erect a hall for the use of members of trade unions in Liverpool and district, the cost being met by raising £5000 in £1 shares. The proposal is now being considered by the various trade societies, and their recommendations will be presented at the meeting of the Liverpool and Vicinity United Trades and Labour Council in March.

IT is proposed to raise a special fund, to be called the Baptist Union Twentieth Century Fund, of £250,000, from half a million Baptists, in view of the vast increase of population in the towns; and the fact that there has been no corresponding increase in the provision of places of worship by the Baptist Denomination. The fund will be opened on May 7th next, and closed on March 31st, 1901.

PLYMOUTH is to have a municipal museum and Art gallery. The contents will be divided into three sections:—(1.) Natural history, including geology, botany, and zoology. (2.) Anthropology and History. Dealing with the history of man from his first appearance on earth and the story of his civilisation. The history of the counties and the town. (3.) Art. Pictorial, ceramic, and other branches.

MR. HAMO THORNICROFT has just completed a statue of the Queen, which is to be erected at Durban, Natal, in commemoration of Her Majesty's Diamond Jubilee. The statue is of the finest Sicilian marble, and is about 10ft. in height. The pedestal, which has preceded the statue to Durban, is also of marble, and is of a height of from 10ft. to 11ft. The total cost of the statue and pedestal will be over £2000.

AN alarming explosion occurred recently at one of the transformers stations connected with the electric light in High Street, Ayr. The cover of the transformer, weighing over one hundredweight, was suddenly blown into the air, and a blast of flame issued from the opening. It was supposed that an accumulation of gas was ignited by an electric spark. The street was crowded, and several persons had a narrow escape.

SHERNBORNE CHURCH, Norfolk, situate on the Sandringham estate, was recently reopened by the Prince of Wales. The cost of restoration has been about £2000. When he purchased the property in 1861 all the churches were in a dilapidated and ruinous condition, excepting Sandringham within the Park, which has since been considerably improved, enlarged, and beautified, but one by one the Prince has at his own expense had them restored.

In the course of the recent excavations in High Holborn, Mr. S. Hazzledine Warren, F.G.S., found some interesting pre-historic remains, in the shape of hatchets and other implements rudely chipped in flint, in the heaps of gravel that were thrown out of the holes. The implements belong to the Older Stone Age, and came from gravel which was thrown down by the Thames after the close of the Ice Age.

THE annual distribution of prizes in connection with the Newport Technical and Art Schools took place on Tuesday week. Medals were awarded as follows:—In Art: Bronze, Janet T. Simpson; silver, Ernest Richards; gold, W. J. Bush. In Science: Bronze, Reginald Herbert; silver, A. Mortimore; gold, Thos. A. Parkes. A feature was the exhibition of students' drawings, which were much admired.

AMONG the proposals for celebrating the Cromwell tercentenary is one for erecting a monument to the Protector's memory. The house that Cromwell lived in at Highgate still stands, and it is suggested that this building should be purchased and opened as a museum. Many relics of the Commonwealth and mementoes of Cromwell are scattered about the country, and if these were collected an interesting museum would be formed.

SIR HENRY THOMPSON, besides being a recognised authority on surgery and surgical appliances, has attained no little eminence in other fields of endeavour. His spare moments are taken up with the study and practice of Art, chiefly painting, and he has exhibited no less than fifteen paintings at the Royal Academy, the Salon, and other artistic centres. At his own observatory in the country he devotes himself to the study of astronomy.

At a meeting of the Colne Town Council on Jan. 2, it was resolved, on the motion of Mr. Holmes, chairman of the Public Library and Technical Schools Committee, seconded by Mr. Riding, that the report of the architect on the cost of the new technical schools, public library, and central hall be adopted, such scheme not to exceed £9000, and that the architects be paid £200 for work done up to the present time in full settlement of claim.

THE recently-built Theatre of Varieties at Cork, the only music hall in the city, is now offered for sale. The Cork official liquidator to the company that owns the hall issued an announcement that he is prepared and authorised to invite and receive tenders for the purchase of the hall, which can accommodate 1500 persons, and is open to the public nightly. The building is held under leases for 100 years from 1896 at £420 per annum.

At Stonehaven the building trade during 1898 has been in an extremely prosperous condition. The supply of new houses has scarcely kept pace with the demand, and, in addition to new buildings, there has been an exceptionally large amount of improvements carried out on existing buildings. The value of the new buildings for which plans were passed during the year amounts to nearly £22,000, which is considered a splendid record for a place like Stonehaven.

FROM Pitlochry, N.B., it is reported that the building trades during 1898 were generally in a satisfactory condition, though the exceptional activity of the early part of the year slackened off somewhat afterwards. Among the largest contracts of the year were the erection of new buildings in connection with Aldour Distillery, and a large addition to Fisher's Hotel. A new Board School has been built, and the erection of a public hall is the most important work to be taken in hand in the near future.

A rich vein of iron ore of an intensely dark colour, together with other valuable minerals, has been discovered at Ardnarmurghan, in Argyllshire. It extends from the western shore across the peninsula to Carraig, on the northern shore. High expectations are entertained that the find will prove very valuable. Workmen have started operations, and a road is being made leading from the mines to the seashore at a place called Ormiskagbeg, near the lighthouse of Ardnarmurghan, where a pier is to be built for shipping purposes.

Professional Items.

ABERDEEN.—Plans of new buildings of the aggregate value of about £20,000 have recently been sanctioned by the Plans Committee of Aberdeen Town Council. The buildings include a new Free Church to be erected at Beechgrove Avenue, at an estimated cost of £8000, and a hotel to be built in Guild Street. Mr. G. Wilson is the architect for the new hotel. The plans for eleven blocks of dwelling-houses were also passed.

BLYTH.—A new church at Cambois, near Blyth, was dedicated on Dec. 31 by the Bishop of Newcastle. The church is a neat brick building, with stone ornamentation, and having accommodation for some 200 persons. Sir Matthew White Ridley, Bart., M.P., gave the site, which comprises about 800 square yards, and is valued at £140. The total cost of the building is £1000, and practically the whole of this money has already been provided. The church has been erected by Messrs. Carse and Sons, of Amble, from plans by Messrs. Hicks and Charleswood, of Newcastle.

CHELMSFORD.—A new Church Hall, which has been erected at Springfield Hill, Chelmsford, was dedicated by the Bishop of Colchester on December 28th. The Hall, which has been built in red brick, with Bath stone dressings, consists of a main hall, measuring 65ft. by 24ft., and capable of seating 365 persons; a class room or vestry, 15ft. by 12ft.; and a scullery. The floor is formed of boarding, laid upon solid concrete, in order to prevent vibration, and the inside walls are plastered throughout, and finished off in distemper tints. The windows are fitted with tinted glass in lead lights, and the roof is covered with rain and snow-proof tiles. The building is heated with hot water pipes laid in channels in the floor, and great care has been taken to provide efficient ventilation. The fresh air is admitted by flues in each alternate buttress, the air entering the Hall at the height of 7ft., whilst the vitiated air escapes through gratings in the roof. The lighting is done by incandescent gas burners. The Hall is faced by a dwarf brick wall, and this is to be surmounted by a wrought iron fence. The work has cost about £700, and in addition to this the ground cost £250. The general contract has been substantially carried out by Mr. F. Johnson; the heating apparatus has been supplied by Mr. W. Seabrook; and the glazing has been done by Messrs. Britten and Gilson, of Southwark. Mr. G. E. Clare has acted as the honorary architect, and the work has all been executed from his plans, and under his supervision.

DONCASTER.—A stained-glass window has been placed at the east end of the church at Arksey, Doncaster, by Lady Cook, of Wheatley, in memory of the late Sir William R. C. Cooke. At a special dedicatory service held on Dec. 29, the Bishop of Beverley preached, and the vicar (the Rev. T. Todd) also took part in the service. The window is in three lights, and the subjects are, in the centre, the Crucifixion, on one side St. Mary, and on the other side St. John. The work has been executed by Messrs. Heaton, Butler, and Bayne, Garrick Street, London.

EDINBURGH.—New halls are to be erected for the Wesleyan Methodist West End Mission at the corner of Earl Grey Street and Wellington Place, Tollcross, Edinburgh. A sum of nearly £20,000 has been paid for the site. The street and basement floors have been planned as business premises. Ten commodious shops with extensive cellarage occupy these floors. A wide staircase leads to the large hall on first floor, and this hall is planned to accommodate, along with a gallery, 1600 to 1700 persons. On the first floor there is also arranged a small hall seated to accommodate 280 persons, with platform at one end and classroom and lavatory accommodation at the other. The whole of the upper floors are arranged for classrooms, stores, and caretaker's house. Special atten-

tion has been paid to the entrances and exits of these, as well as of all other parts of the building. Externally the buildings have been designed in a free treatment of the French Renaissance, and when completed will add considerably to the architectural dignity of the district. The whole scheme has been designed by Messrs. Dunn and Findlay, architects, Edinburgh, and will be carried out under their direction. The total cost of the scheme will be over £40,000.

GLASGOW.—The memorial stone of the new Hutchesontown Parish Church, Glasgow, has been laid. The old parish church was built fifty-nine years ago. Last year, however, the Glasgow and South Western Railway Company acquired the site for extension purposes, with the result that a new edifice had to be erected. The building is estimated to cost £6300. The site has a frontage to Rutherglen Road of 125ft., and to Rose Street of 108ft. The site also provides accommodation for capacious halls to seat 600 people. The church has been designed by the architect, Mr. Alexander Adam, St. Vincent Street, Glasgow, in the semi-Romanesque style of Architecture. It is divided into side aisles and north and south areas, with side and back galleries, the seating accommodation being 950. The special feature of the interior is a chancel arch of chiselled stonework, divided into three sub-arches, the organ chamber being behind and the pulpit in front. The walls are of red sandstone. The church will have a tower with four pinnacles. The contractors are all Glasgow firms:—Slater work, Messrs. A. and D. Mackay; masons and brick work, Messrs. Webster, Walker, and Webster; wright work, Mr. Alexander Ferguson; plumber work, Messrs. James Ingleton and Co.; plaster work, Mr. James Macmillan; glaziers, Messrs. George Walton and Co.; tiles and grates, by Messrs. Keen and Ward; painter work, Mr. John L. Duncan; heating apparatus, by Messrs. Cormack and Sons; ventilators, by Mr. James Cousland.

LONDON.—A handsome building has just been erected at 5 and 6, Bishopsgate Street, Within, for Messrs. Bull and Sons, goldsmiths, silversmiths, and pawnbrokers. The present structure consists of over forty rooms, those above the ground floor being let as City offices. The staircase and hydraulic lift, which conveys the visitor to any part of the building, is approached from the main street by means of the corridor. The walls are ornamented with tessellated tiles, and the lavatory accommodation and lighting arrangements are admirable. Messrs. Patman and Fotheringham, of Theobald's Road, are the builders, and the architect is Mr. G. Vickery, of 50, Gresham Street. The shop fittings have been supplied by Messrs. Spreckley and Co., of Gray's Inn Road.

WREXHAM.—At a special meeting of the Wrexham School Board, held on December 30th, under the presidency of Sir R. E. Egerton, the award of the assessor on the plans sent in for the proposed new board schools for Wrexham was considered. The competition was confined to architects practising in the town, and nine sets of plans were sent in. The assessor appointed by the Board was Mr. W. E. Willink, F.R.I.B.A., Liverpool, and he awarded the first premium to Mr. W. Moss, Regent Street; the second to Mr. John Harris, Westminster Buildings; and the third to Mr. J. H. Swainson, Holt Street. The Board asked for plans for accommodation for 1000 children 400 boys, 300 girls, and 300 infants—and the entire cost, exclusive of building site, was not to exceed £8000.—Mr. Willink said they could not get what they wanted for the money, and he estimated that the first plan would cost £9610 to carry out, and the others £10,995 and £10,607.—The Chairman proposed that the assessor's award be accepted, and the £30 premium paid to Mr. Moss.—The Vice-Chairman (Mr. John Francis) seconded, and the motion was carried unanimously.—The plans showed some exceedingly clever work, and it was decided to exhibit them.

Enquiry Department.

CHIMNEY STACK.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I am about to build a brick chimney stack, octagonal on plan, the height of which is to be 75ft. What size should it be at base and what at top? And should flue be of one size throughout?—Yours, &c. E. S.

There is a chapter on Chimney Shafts in "Stresses and Thrusts" by G. A. T. Middleton, A.R.I.B.A. This would no doubt be useful to you. But to answer your query in sufficient detail to be of value would involve a long article and a specially prepared design of the chimney.

MEASUREMENT OF PARISH CHURCHES.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly tell me if there is any book published giving the principal measurements of the more noteworthy parish churches, similar to those of the cathedrals given by Gwilt?—Yours truly, R. A. D.

Brandon's "Parish Churches" will give you the dimensions of a very large number of parish churches, with plans, sketches, elevations and sections of any peculiar or remarkable features in each, and other particulars as to style and date.

CONTRACTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Will you kindly answer the following questions?—(A) Contract form: Instead of having a separate form of contract for each trade, how can one form be used for the several contractors to sign, where the work is let to different tradesmen? (B) Contracts: Is it legal to make the materials delivered upon the ground form part of the contract, together with the plant, such as engines, cranes, workmen's sheds, scaffolding, barrows, and tools? I have an impression there is some difficulty in enforcing and retaining the foregoing; but if it can be accomplished, a clause or clauses embodying the same would greatly oblige, and no doubt would be of service to many of your readers. (C) Contracts and general conditions: Can you give a definition showing where the clauses of one and those of the other begin and end, so that they can be kept separate?—Yours respectfully, "DOUBTFUL."

(A) We should think it an unsatisfactory plan for several contractors to sign the same agreement, each for his own particular share of a large piece of work. If this course be imperative, however, we fancy a local solicitor should be employed to draw up the form, to whom the special circumstances could be described in detail; though separate agreement forms for each contractor would probably lead to less confusion, each containing reference to the same plans, specification, and conditions of contract "or so much thereof as refers to the trade of —"

(B) Clause 26 of the R.I.B.A. Conditions of Contract (obtainable from the Secretary, R.I.B.A., 9, Conduit Street, W., price one shilling) has been most carefully worded to meet this point. Under it the building owner has a lien upon the plant, &c., of the original contractor, and can use the same until the contract work is completed, even if a second contractor or other person has to be called in to complete the work.

(C) The contract is quite a short document. An agreement by one person to do certain works in accordance with certain plans, specifications, and conditions, in consideration of certain moneys to be paid in the manner set forth in the same conditions by some other person. It needs dating, signing by both parties in the presence of one witness each, and stamping with a sixpenny stamp within fourteen days of its date. Any post office will accept it and forward it to Somerset House for stamping. A simple and satisfactory form is issued by the R.I.B.A., with the set of conditions mentioned in answer to (B).

Views and Reviews.

CATHEDRALS, ABBEYS, AND CHURCHES.

The issue of a new and revised edition of Messrs. Cassell's "Cathedrals, Abbeys, and Churches of England and Wales" gives us an opportunity of calling the attention of our readers to a work that should be of considerable interest to all students of Ecclesiastical Architecture. Not that this is a book for students especially; it is got up in the popular style characteristic of the publications that issue from La Belle Sauvage, and is full of historical and legendary lore. But owing to the wide extent of the field covered, and the number and general excellence of the illustrations, it is likely to be of some practical value as a work of reference for students. All the cathedrals and a great many of the most beautiful and interesting abbeys and churches in England and Wales are described and illustrated, and reference is facilitated by a copious index.

One of the most valuable features of the work is the Introduction, which is contributed by the editor, Professor T. G. Bonney, who treats at some length on the architectural characteristics of English cathedrals as compared with those of Continental nations, and especially with those of North-Western France, which our English cathedrals most closely resemble in design and plan. Professor Bonney takes up his parable against what he calls "the epidemic of restoration" which has affected the custodians of cathedrals and old churches during recent years. While admitting that sometimes the progress of decay may have been arrested and the stability of the building secured by the new work that has been done, the Reverend Professor complains with some bitterness that "not seldom the architect has been turned loose on the building to work his will almost unchecked, to impress his own individuality on the cathedral, to run up a big bill, to advertise his name, and advance a stage towards knight-hood." We hope this philippic will give pause to the next of our readers who is "turned loose" on an old cathedral. But, seriously, we suggest that this and similar denunciations of the wicked architect who restores are a little overdone. His task is one of singular delicacy and difficulty; it is scarcely possible that the effect of new work in juxtaposition to some masterpiece of ancient Architecture can be wholly and unequivocally pleasing. Yet if the architect does his work with taste and discretion, as he often does, he is deserving of the thanks—not the execration—of the community.

Most of the articles in these volumes are written either by the editor or by one of the clergy of the cathedral or church described. They may, therefore, be regarded as authoritative, as far as they go. The illustrations, nearly 500 in number, are for the most part wood engravings, but they include also some charming pen-and-ink drawings by Herbert Railton and others.

"Cathedrals, Abbeys, and Churches of England and Wales." Edited by Professor T. G. Bonney, D.Sc., LL.D., F.R.S. Cassell and Co. Limited.

THE MADONNA IN ART.

This book is apparently a textual reprint of an earlier American edition of a larger size, for the last paragraph of the preface refers to and describes the design for a quite different and more imposing cover than that which now appears. Some revision of the text would have been an advantage to the English edition, as it is written, naturally, very much from the American standpoint, and stress is laid upon matters which are not of much interest to English readers. For instance, Mary L. Macomber may be a painter well known in America, but English people will think that her name occurs strangely in the list of artists between Luini and Mantegna. The authoress appears to have wished to give an aspect of quaintness to her pages, by the use of words employed in an unusual manner—"tip-

tilted" is a word which one has seen applied to a rose, but not to a whole face as on page 73, and such use of it seems unmeaning. On page 178, a veil which falls loosely over the Virgin's head, is described as a "wimple." One may explain that a wimple was a linen cloth worn by women closely wrapped around the face and throat and over the chest, and that in Vivarini's picture, which is illustrated, the neck is uncovered, and the veil on the head is of a different colour from the drapery beneath it loosely wrapped around the shoulders. Again, on page 182, the word "obverse" is used as designating both sides of a thing—one may point out that the two sides of a coin or medal from which the simile must be taken are the "obverse" and the "reverse." These and similar blemishes might have been removed by a little careful revision.

In a book of this kind the quality of the reproductions of the pictures referred to is really of more importance than the text, and in this instance they are most of them very well done, being generally made from photographs taken from the originals. Why Filippo Lippi's Madonna from the Pitti should be classed among the "pastoral" Madonnas, while a composition almost identical, so far as the principal figures are concerned, in pose and expression, by Lorenzo di Credi, in the Uffizi, is included among the Madonnas "in adoration," is the secret of the authoress.

On page 47 a picture by Raphael, the "Madonna of St. Anthony . . . (loaned (sic) by the King of Naples)," is mentioned as being in the National Gallery, where no such picture is to be found. It would have been better to add a footnote stating that this is generally known as the Ripalda Raphael, and that it was only for a short time in the downstairs rooms of the institution mentioned, though it was on view at South Kensington for a considerable time, while the question of its purchase was under consideration, which was eventually decided in the negative. The present statement is misleading. On page 94, the landscape background of three of Raphael's pictures is referred to as "typical Tuscan landscape." Surely the difference between these and those of which the inspiration is universally acknowledged to be Umbrian, is not so great as to justify such an assertion. Throughout his life, the serene skies and beautiful distances of his native land, seen more or less through his master's eyes, enchain his imagination, and even if details here and there can be proved to be taken from Tuscany, the quiet harmonies of brown and grey tones, with the little cities perched upon the hills overlooking the still waters of lake or tranquil river, recall Umbria rather than that district. The fine figure of Francesco Gonzaga in Mantegna's Madonna of Victory, in the Louvre, with its interesting and beautifully drawn and painted details of costume, is referred to as an example of the introduction of the "prosaic figure of the donor," on p. 41! One may write reams about the spiritual meaning of ancient pictures of the Madonna; it is a most attractive subject for mild philosophizing. But the fact remains that many of the most admired creations in this direction are portraits of the women loved at the time by the artists who painted them, and it may be assumed with considerable probability that in most cases the principal object aimed at was the conquest of artistic difficulties, and the satisfaction of the patron. The church is no longer the principal patron of Art, and it is not likely that such pictures will ever again be produced in any quantity, the spirit of modern times neither demanding nor inspiring them. For those who wish to recall the feelings impressed upon their minds by the sight of such beautiful ancient works of Art amid unfamiliar surroundings, the illustrations in this book will be useful, and others who have never seen the pictures may realise by the aid of the text something of the emotions which were produced in the mind of another by the contemplation of them.

A.W.

"The Madonna in Art." By Estelle M. Hurll. Illustrated. London: David Nutt, 270-71, Strand, 1898

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to

Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

CONVENTIONAL SIGNS USED IN LAND SURVEYING.

By G. A. T. MIDDLETON, A.R.I.B.A.

THOUGH individual practice varies to a certain small extent, there are a considerable number of conventional signs used by land surveyors which it is convenient should be universally adopted, and which in fact are so very largely. Those which occur upon the Government plans are particularly well-known, and frequently, in field books, similar signs are used, only more roughly drawn.

The accompanying illustrations put these in a form which may possibly be found convenient for reference, though, when using them, every surveyor will be sure to adopt modifications of his own to suit his particular practice. Very frequently some objects which, for the particular survey undertaken it is expedient to frequently locate, such as trees, street gullies, or lamp-posts, are designated by what may be called "home-made signs," such as a cross, a star or a circle, a note being made at the commencement of the field book on each particular survey as to what these signs represent. It is also the practice with many to enter these signs both in field book and on finished plan, in the form of a rough elevation of the object to be identified; this is very frequently the case with gates, stiles, and railway signal posts, these last having usually the correct number and position of the semaphores shown. It will be seen in the accompanying diagrams that a good many other objects are commonly shown in this way. The idea is as old as the oldest maps in existence, is reasonable, and can be extended to meet almost any circumstances.

SIGNS USED IN SURVEYING.

CONDITIONS WHICH RENDER HOUSES UNHEALTHY.*

By JAS. I. LITTLE,
Late County Sanitary Inspector, Renfrewshire.

(Continued from page clxxiii.)

SPEAKING of dwelling-houses, Sir B. W. Richardson maintained that no part ought to be excluded from the possession of architectural art, because it is the tendency of the human mind to let that which is disagreeable, plain, and ugly go without regard, and accumulate dirt and disorder. Hence all the offices of a house should have as much care bestowed on them as living-rooms, to render them bright and cheerful, and to make cleanliness as obvious a necessity in the one as in the other. In this lecture Sir Benjamin made a great point of the treatment of floors, referring particularly to the ancient Roman mosaic floors, which were not only beautiful works of art, but easily cleaned, and which, by the well-known Hypocaust system of warming, diffused an equable and agreeable warmth through the room without draughts.

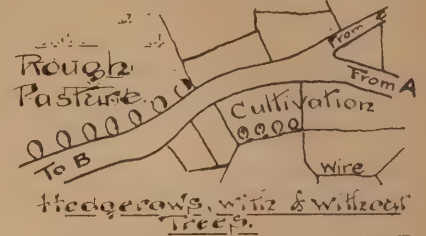

The architect of to-day has no easy task assigned to him when called upon to erect a tenement of workmen's houses. He must keep in view the commercial aspect, so as to make the undertaking pay; he ought to have sanitary science at his finger's ends, so as to adopt and apply all that is now known to be essential to the physical as well as the moral welfare of the occupants; and he must have artistic skill, so that the erection may not be an everlasting eyesore.

CONSTRUCTION.

The method of construction has also much to do with the healthiness of a house, several of the arrangements of present day construction being at variance with the natural laws of ventilation, and tending to encourage the accumulation of dust, which is never a sign of the healthy condition of a house. In considering this, however, we must bear in mind that houses built in open situations in the country are surrounded by a pure and open atmosphere, while houses in large towns are permeated by an atmosphere laden with impurities and dust, which is continually being deposited on every surface that will retain or absorb them. Town houses are more subject also to the incursion of various types of vermin, from the cockroach down to the even more noxious and happily rarer examples. It is, therefore, desirable that town houses, especially, should be constructed of materials least likely to absorb and retain impurities, and that the method of construction should be such as to leave no unlighted and inaccessible spaces where dust will find a lodgment.

These requirements are not habitually carried out in the construction of houses. The method of forming upper floors of houses by means of joists laid from wall to wall, on which boards are nailed to form the floor, and the underside is lathed and plastered to form the ceiling, is the means of providing an unventilated store room, for the accumulation of such dirt and decaying matter as can gain access into the space between the ceiling and floorboards. Tenants of even the best kept houses would be disagreeably surprised at the amount of dirt they could find under their flooring boards. Why should the space not be filled up solid? I am sure it would both be healthier for the inmates and more pleasant and quieter for the families living on the lower floors in tenements. The old-fashioned method of leaving the joists exposed was even more sanitary. The same may be said of the attic space, which forms the dark cavern between the roof and the upper ceiling. The base projections, chair-rails, and many of the styles of cornices "stuck" up, are just shelves for the reception of

* A paper read before the Glasgow and West of Scotland Technical College Architectural Craftsmen's Society.

Symbols used in the Surveying

SIGNS USED IN SURVEYING.

dust, and the larger and more dignified the room is, the greater the projection of base it is considered necessary to have. Moreover the space behind merely forms a safe refuge and free run for the vermin and mice who enjoy their gambols in the private corridors we have obligingly provided for them, and in many cases the space gets filled with dust owing to the shrinkage of the material. The wood casing of baths and waterclosets is one of the most objectionable forms of furnishing a storage space for filth and dirt. They are mere "whited sepulchres;" to all appearance everything is neat and clean, but look inside and what is found?

BUILDING MATERIALS.

In every dwelling dryness is an essential of health, therefore the material used in the construction should be of an impermeable nature. In this damp climate of ours, it is quite natural that the materials used for buildings should cause, in many instances, houses to be unhealthy. Many classes of stones used, in present-day buildings, are of a very porous nature, and damp soon finds its way through the walls. The builders naturally choose a class of stone which can readily be converted into the various shapes in which it is required. To use a hard close-grained stone, which will resist the moisture of the air, would swallow up too much of their capital in wages. The same may be said of bricks—hard well burned bricks are more expensive than those of an inferior quality. Not only do porous walls absorb moisture externally, but internally they tend to absorb the moisture given out in breathing and in the combustion of lights, and with it the organic and other impurities contained therein, which after a time decay and become a source of impurity to the air of the room. The interior surface of a wall should be such that it can be

SIGNS USED IN SURVEYING.

It is only necessary to glance through those statistics which show the death-rate in the manufacturing and closely inhabited towns, as compared to the death-rate in the country or the suburbs, to learn the generally well-known lesson that the health of the nation suffers in proportion to the degree that the individuals are crowded.

The law, however, has stepped in to prevent the gross overcrowding of dwellings which has been so common in the past, but these only relate to new buildings, and it will be long before our crowded districts are thoroughly opened up and the excess of buildings is removed. Much more stringent regulations are, however, yet required, as the free space provided for around new buildings is still inadequate. I will here give the amount of free space required by the Local Acts and Building Regulations of various large centres, which I think all will agree is far from sufficient.

The London Building Act 1855 requires that every building used as a dwelling-house shall have all the rooms lighted and ventilated from a street or alley, and shall have in the rear an open space of at least 100 square feet, and the 1882 Act further provides that if the frontage does not exceed 15ft. the open space shall be 150 sq. ft.; that if the frontage does not exceed 20ft. the open space shall be 200 sq. ft.; that if the frontage does not exceed 30ft. the open space shall be 300 sq. ft.; and if the frontage exceeds 30ft. it shall be 450 sq. ft.

Section 38 of the Liverpool Building By-laws provides for an open space adjoining the building of at least 150 sq. ft. and that said open space shall be at least 10ft. wide between the building and the opposite property, but if the building be two stories in height the width shall be 15ft., if three stories 20ft., and if more than three stories 25ft.

The Edinburgh Local Act 1867, Sect. 43, provides that no house shall be of greater height than one and one-half times the width of the adjoining street or court, and that no building shall be more than 60ft. high.

The Glasgow Police Act 1866, Sect. 370, provides for a free space equal to at least three-fourths of the height of the wall of the building.

The Aberdeen Corporation Act, Sect. 56, provides for an open space in rear of dwelling houses one story in height of 150 sq. ft.; two stories in height 225 sq. ft.; three or more stories in height 300 sq. ft.; and that the area of the open space shall not be less than one half of the area of the ground built upon.

The Dundee Local Act demands one-third of the site of free space in the rear of new buildings, or 10ft. wide for each story in height.

The Greenock Local Police Act, Sect. 299, provides for an area of open space, in the rear of every dwelling house, equal to one-fourth of the area built upon.

The Burgh Police (Scotland) Act, 1892, provides for open space attached to the building of an area three-fourths of the space built on.

The Lanarkshire Bye-laws under the Public Health (Scotland) Act, 1897, provide for an area of open space equal to at least two-thirds of the height of the building.

The Renfrewshire Bye-laws, also under the Public Health (Scotland) Act, 1897, provide for an open space in the rear of the building equal to three-fifths of the area built upon.

To show the above more clearly, and for the purpose of comparison, I have computed the above in figures approximately, taking 1'000 as unity, that is free space equal to built on space.

Unity	1'000
London	250
Liverpool	625
Edinburgh	666
Glasgow	750
Aberdeen	500
Dundee	400
Greenock	300
Burgh Police (Sect.) Act	750
Lanarkshire By-laws	750
Renfrewshire By-laws	720

CLEANLINESS.

Cleanliness is absolutely necessary, if a house is to be healthy. The site, the drainage, the ventilation and the structure may be perfect, but without cleanliness no dwelling-house will be healthy, and cleanliness is not only necessary inside, but the outside and surroundings must be kept equally clean, if the health of the occupiers is to be preserved. It is well known that an individual, who realises the

satisfaction of cleanliness, becomes sensitive to the discomfort and unwholesomeness of dirt. Many of our sanitary improvements arise out of the deep-rooted dislike to dirt.

DRAINAGE.

In considering the conditions which render a house unhealthy, drainage cannot be passed over. A dwelling cannot be said to be fit for human habitation if it has not the advantage of a good system of drainage, or if the drains are not properly trapped off from the building and ventilated. The chief objects of a perfect system of drainage are:—

1. The removal from the house of all waste and foul matter produced from baths, sinks, washhand basins, waterclosets, &c., and that in the most speedy manner.

2. The prevention of any back current of foul air entering the house through the drains.

Drains being buried in the ground and out of sight should be very carefully constructed, as a badly laid drain may do irremediable evil. The waste discharged into drains putrefies and decomposes the moment it enters the pipes, and putrid gases and the noxious effluvia capable of being given off from the mixed ingredients of which such waste is composed, fill the pipes. No drain should therefore be allowed to enter the house; all should be disconnected in the outer air, except, of course, that from the w.c., which is ventilated full bore to above the roof. An imperfectly ventilated system of drains is also always a lurking evil, as, if the least flaw occurs in the structure of the drain, the warm atmosphere of the house will act as a suction from that point, and introduce impure air into the dwelling.

PLUMBING WORK.

Defective and untradesmanlike plumbing fittings are always associated with unhealthy dwellings, but as the plumber is now given his proper place by the public as being an important factor in the production of a healthy dwelling, it would be superfluous on my part to go into the merits and demerits of the various and multitudinous plumbing arrangements in connection with the modern house.

WATER.

Next in importance to pure air is pure water. Good water should be clear, colourless, tasteless, and odourless, and no deposit or floating particles should be observable in it. Water is liable to be polluted in various ways, both at its source and in course of transit or delivery. The principal impurity to be guarded against is organic matter, which is commonly caused by the well, or other source of supply, receiving the drainage from impure soil; and that organic impurity is common is shown by the fact that few suspicious waters are tested without the analyst adding that it contains impurities equal to a certain percentage of town's sewage.

"Nothing is more clearly proved," says Mr. Wynter Blyth, "than the fact that a large population may drink a sewage polluted water with the utmost impunity under certain conditions. Water polluted by healthy human or animal sewage, nasty and abominable liquid as it may be, will produce no disease; water infected with the excretions from diseased natures will cause disease.

"Since, however, at the present time we cannot differentiate between those excrementitious matters which cause disease and those which do not cause disease, it is clearly safest to condemn as a supply a liquid which has been proved to be contaminated by a something, which, for ought we know, contains the seed of typhoid fever or of cholera."

It is therefore most important that every house should be provided with a supply of water which is above suspicion, and that the supply be constant and sufficient for the wants of the occupiers. It may be well to note that water which contains air acts on lead, and may lead to lead poisoning, so that where it is necessary to use lead pipes they should be tin lined. Another source of danger is lead-lined cisterns. No necessity for storage on the premises, however, should exist; but if cisterns are really necessary let them be placed where they are easily accessible, and by all means let them be covered.

Surveying and Sanitary Notes.

CONTRACTS for extensive irrigation works on the Nile are being placed in the hands of British firms. Machinery, plant, and materials have been obtained from Ipswich, Lincoln, Leeds, Sheffield, Thornaby-on-Tees, Colne, Preston, Workington, Manchester, Birmingham, Wolverhampton, Stafford, Bristol, Cardiff, Portsmouth, Glasgow, Belfast, and London. All the cement has been obtained from England.

THE opposition to the London County Council's water scheme, to which reference was made in this column a fortnight ago, shows no signs of abating. The farmers and land aristocracy in the Welsh countries from which the water is proposed to be drawn are protesting against the depletion of their water resources, and against the construction of the works necessary to give effect to the Council's proposal. Meetings of protest are being held, foreshadowing strong opposition to the deposited Bill, and the London water companies have sent to the Hirwain and Wye valleys, a staff of gentlemen experienced in the work of references, to check the plans and books of references with a view to opposition being offered before the examiners of private Bills.

AN alternative scheme for obtaining an adequate water supply for the Metropolis has been submitted to the London County Council by Mr. Walter Moseley. The proposal is that by sinking a number of artesian wells, the Council should tap a huge natural reservoir of pure water that exists in a chalk basin hundreds of feet below the surface of the City. The quantity of water always in reserve in this basin is enormous; according to Mr. Moseley, it is fifty million million gallons. The artesian wells which supply the fountains in Trafalgar Square and various Government Offices are mentioned as examples of the pure water obtainable from the London basin, and it is maintained that this scheme has a further advantage over the Welsh aqueduct scheme in that it would effect a saving of at least £20,000,000.

COPIES of the Leeds Corporation Sewerage Committee's recent report on the biological experiments at Knostrop are being supplied, not only to members of the City Council, but, under the chairman's directions, to members of the West Riding Rivers Board and of the Royal Commission on Sewage. It will thus be made clear to all interested in this important question that Leeds is doing its utmost to improve the existing condition of affairs. The committee have also resolved to obtain from Mr. Cameron, of Exeter, a plan and estimate of the cost of providing a septic tank for an experiment at Knostrop for testing the action of Mr. Cameron's system upon Leeds sewage.

UNDER the supervision of Mr. Dibdin, some very interesting experiments have been going on at Leeds during the last year with a "biological" sewage tank. A report has now been presented which shows that, notwithstanding the large quantities of chemical waste coming down the sewers, the bacterial beds purified the sewage to such an extent that it was perfectly fit to be passed into a stream very much purer than the River Aire; that, the sludging-up of the tank could be largely prevented by allowing the grit to subside, and that an occasional rest of a week or a fortnight enabled the bacteria in the tank to dispose of the organic portion of the sludge. It is probable as a result of this experiment that, under ordinary circumstances, allowing certain intervals of rest, some 400,000 gallons of Leeds sewage could be dealt with on an acre of filtering bed. This would mean for a town the size of Leeds a minimum of forty acres of filtering beds for an ordinary dry weather flow. The Corporation has resolved

to put down three other tanks to carry on the experiments further. Two of one-eighth of an acre each will duplicate the existing tank, and the third of a quarter of an acre will be used for further experiments with the effluent from the present lime precipitation works, which are themselves meanwhile being increased to something more like the size required for the town.

THE annual meeting of the New Panama Canal Company was held in Paris on December 28th. The directors reported that the Technical Committee (which includes General Abbot, of the United States Engineer Corps, and Mr. Hunter, engineer of the Manchester Ship Canal) had considered various alternative plans for the completion of the canal. In the scheme they recommended, there are four locks on the Atlantic and three on the Pacific side; the supply of water to the canal is arranged by a dam in the upper valley of the Chagres. There are now 3400 navvies at work on the canal, and the directors anticipate that the renewal of the concession for six years will be granted by the Colombian Government. The report proceeds to refer to the prevalent feeling in America that after the disaster of the old Panama Company, the Panama route was no longer to be taken into account. This impression the directors have been endeavouring to counteract, by representations to the American government and otherwise, pointing out that the Panama route is indisputably that which can be opened to navigation in the shortest time and with the least expense.

MR. F. REDMAN, the vice-president of the London Butchers' Society, in a letter to the Press on the subject of the proposed erection of public abattoirs, says the proposal "is the maddest and most expensive which could be devised, will greatly disturb trade, must increase the price of meat to the consumer, and is not the sober method of business men, but the crazy dream of vegetarians, municipalisers of labour, and public medical men, who can afford to ignore the relations between cost and result." He suggests that, in preference to this scheme, the London County Council should discuss the proposals made by the butchers to the effect that the present local and London County Council inspectors, or a special staff appointed for that purpose alone, should inspect all meat killed in private slaughter-houses under regulations (which could be easily devised) that would prevent any passing into the shops for sale without such inspection? A special staff could be appointed, with an average of only ten slaughter-houses under each inspector's care, at a cost of from £7000 to £8000 a year, and this would only be about a tithe of the cost it was proposed to inflict on London.

THE construction of a suitable harbour and quay at Mallaig formed a vital part of the scheme for the extension of the West Highland Railway, and the cost of this auxiliary undertaking was estimated at close upon £30,000. It now appears that there are certain formidable and unforeseen engineering difficulties in the way of executing the project. Past surveys of a more or less cursory character seemed to have proved that the layer of sand forming the bed of Mallaig Bay was underlain by a muddy or clayey formation. It was therefore concluded that the process of deepening the area to be embraced in the proposed harbour—a process indispensably necessary in order that the harbour may be navigable by vessels of large draught—would not only be feasible but comparatively inexpensive. A more careful and precise survey has recently been made, and the result is likely to upset all former calculations. It now appears to be thoroughly established that the superior 3ft. layer of sand rests not upon a substratum of clay but upon the solid rock. This fact will render any deepening operation by the 3ft. of sand absolutely impracticable. The possible effect of this unfortunate discovery on the almost completed Mallaig extension of the West Highland Railway is regarded with some grave apprehension.

Builders' Notes.

FROM the beginning of the New Year the rate of wages for painters at Greenock is 9d. per hour, an advance of $\frac{1}{2}$ d.

THE bricklayers of Birmingham have asked for an advance of $\frac{1}{2}$ d. per hour, which will probably be conceded to them in April next. Some difficulty is anticipated, however, with regard to the questions of the employment of apprentices and payment for night work, the employers being desirous of making fresh regulations on these points.

At Cardiff Police Court the Cardiff Corporation summoned Mr. Henry Gibbon, builder, for wrongfully using water that was the property of the Cardiff Corporation. Mr. Gibbon was making some alterations in the buildings around the Drill Hall. The Drill Hall authorities gave him power to use water which was supplied to them for domestic purposes only. Water used for the purpose defendant wanted it should be paid for at a higher rate than that used for domestic purposes.—The Stipendiary held that there was evidently no desire on the part of Mr. Gibbon to evade or defy the law, and imposed a nominal fine of 1s. without costs.

At a largely-attended meeting of the Master Masons' Association of Glasgow and neighbourhood the question of the increase in the price of stone was recently considered, and regret was expressed that none of the quarrymasters who had been approached could see their way to finish existing contracts at the old rates, or defer the date when the increase in rates should take place. In view of this limited notice, which in nearly every instance did not exceed one week, the meeting was unanimously of opinion that the position of contractors should be made known to proprietors, architects, and public bodies, and in order to secure this it was resolved that a circular be framed and sent to them, stating fully the views held by the meeting.

A DEPUTATION of those interested in the promotion of the Parliamentary Bill for the Registration of Plumbers waited on the Secretary for Scotland, Lord Balfour of Burleigh, last week, for the purpose of representing to him the desirableness of making the Bill a Government measure. The deputation was representative of the whole of the six district councils in Scotland of the National Registration of Plumbers.—Ex-Bailie Crawford briefly explained the objects of the movement, and the necessity felt for legislative sanction for it. The movement had now been in existence for fifteen years, and a bill had been read a second time by three successive Parliaments, and had twice passed through committees of the House of Commons. The bill did not seek in any way to create a monopoly. Its aim was solely to establish a thoroughly representative general council, which would have certain discretionary powers, and the bill would also prohibit under a penalty the use by any one of the term "registered" who was not registered under the Act.—Lord Burleigh, in reply, expressed his sense of the importance of the deputation, and his complete sympathy with the movement for introducing a higher standard of qualification, and a higher code of honour among those to whom the responsible work of the plumbing and the drainage of dwelling-houses was entrusted. He was satisfied that the movement did not aim at any monopoly. While he was not in a position to commit the Government at that stage, he would undertake to report immediately on his return to London in the beginning of the year the representations which had been submitted to him, and to confer with the representatives of the Local Government Board for England as to possible assistance towards securing the passage of the bill into law.

Trade and Craft.

THE IMPROVED ELECTRIC GLOW LAMP CO. LTD.

The electric light, without a doubt, is now an established feature of our modern civilisation. Equally, without a doubt, it will be always with us, but that we may appreciate its white glare the more, there needs must arise someone who will popularise electric lighting. Now that the form of illuminant is well-established, man's ingenuity must wrestle with the problems of how to obtain novelty of effect and to economise the current. The Improved Electric Glow Lamp Company Ltd., have been pioneers in this matter, but what has yet been accomplished can only be regarded as a beginning; think of the possibilities of novel and decorative lighting! What scope for an inventive brain! First of all, this form of illuminant must be cheapened and made more easily accessible for isolated application. There is opened a fair field for ingenious and decorative schemes to shed light and lustre all around, to brighten the dark corners of our drawing rooms, and relieve the dullness in many of our public halls and theatres. The Glow Lamp of the Improved Electric Glow Lamp Company achieves much in its way, but, of course, on the decorative side, it only touches the fringe of this wide subject.

FALKIRK IRON CO.

We have received from the Falkirk Iron Co. an illustrated catalogue of their cast-iron mantelpieces. A large number of designs exemplifying many styles are shown in the catalogue by excellent perspective sketches and photographs, which convey a true and vivid impression of many fine examples of cast-iron grates and mantels. A large number of these designs have been made by well-known and eminent architects, and among them we notice several that attracted wide attention at the Art Metal Exhibition at Westminster, where they were exhibited in the early part of last year. We particularly commend the Mantel Grates, cast in one piece, which form a leading feature at the Company's works. These have for the most part been excellently designed, with a true appreciation of the limits and possibilities of cast-iron; they admit of an enormous variety and freedom in design, they are cheap, and we know of no more beautiful or appropriate setting for a fireplace in a bedroom or small sitting room than one of these Mantel Grates. The Falkirk Iron Co. show also some cast-iron fireplaces and mantels of much more elaborate design, suited for the reception rooms of a mansion. In the use and adaptation of cast-iron to this purpose, the Company has taken a leading position among manufacturers. The jambs and overmantels in these examples are ornamented with bevelled or convex mirrors, and are enriched by the use of copper and brass, while many of the fireplaces are designed with brick or tile jambs and backs, and brass or copper hoods. Most of the designs show a skilful and proper use of the material employed, and a full recognition of its limits and possibilities, and we think the Company illustrates in its catalogue some of the best work of this kind that has yet been done. If fireplaces on these patterns are as widely adopted as their aesthetic and practical qualities entitle their makers to expect, it will be a popular recognition of the labour and devotion of the late Mr. William Morris and other enthusiastic workers in the cause of the revival of the art of craftsmanship. The Falkirk Iron Company also exhibit examples of the more usual patterns of cast-iron mantels and fireplaces, designed on the models we associate with mantels of wood and stone, which no doubt they are meant to imitate. These are good of their kind, but in view of the work of the Company already described, they may be considered as a concession to a popular taste, which has yet to be educated in a just appreciation of what is truly admissible, and what inadmissible, in art.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Jan. 13	Hull—Tramway Sheds, &c.	Corporation	A. E. White, City Engineer, Town Hall, Hull.
" 13	Preston—Shedding, &c.	Corporation	Borough Surveyor, Town Hall, Preston.
" 13	Hanwell, Middlesex—School Buildings	Central London School District	J. T. Newman and Jacques, 2, Fen-court, E.C.
" 14	Forres, Scotland—Semi-detached Villas	Building Company Limited	J. Forrest, Architect, High-street, Forres.
" 14	Limerick—National School Teachers' College	Trustees	W. H. Byrne, 20, Suffolk-street, Dublin.
" 14	Normanton-by-Derby—Burial-ground Works	Parish Council	T. A. Fuller, The College, All Saints, Derby.
" 16	Burnley—Rebuilding Hotel	James Grimshaw Ltd.	R. Neill, 9, Grimshaw-street, Burnley.
" 16	Rishton, Lancs.—Conservative Club	J. C. H. Sandback & J. Parker, 15, Richmond-ter. Blackburn.
" 16	London, S.E.—Supply of 60,000 Bricks	Vestry, St. Mary Magdalen, Bermondsey	F. Ryall, Vestry Clerk, Bermondsey Town Hall, Spa-rd., S.E.
" 16	Knowle, near Fareham, Hants—Infirmary Wards, &c.	Committee of Visitors	W. J. Taylor, County Surveyor, the Castle, Winchester.
" 17	Preston—Police Station, Dwelling-houses, &c.	Lancaster County Council	H. Littler, Architect, County Offices, Preston.
" 17	Rochdale—Electricity Works	Gas Committee	T. B. Ball, Manager, Gas Works, Rochdale.

SURREY.—Choice BUILDING ESTATE.

—In a charming district, two miles from Horley station (L.B. and S.C. Rly.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church.

FOR SALE, a compact and valuable FREEHOLD PROPERTY of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Prettily timbered. Gas and water mains along the frontage. Would be divided.

Plans and full particulars of the owner's agents, Messrs. GREEN and SIMES, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W.; or Mr. W. M. LEACH, Auctioneer and Estate Agent, Crawley, Sussex.

FAIRMILE PARK, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

MESSRS. DRIVER and CO. have received instructions to offer to AUCTION at the MART, Tokenhouse-yard, Lothbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of CHARLES JUPP, Esq., Solicitor, 43, Lime-street, E.C.; and of Messrs. DRIVER and Co., 23, Pall Mall, S.W.

By order of Trustees.—Preliminary Advertisement.—Freehold Building Estate, Streatham, near West Norwood Railway Station.

MESSRS. FIELD and SONS, and Messrs. WALFORD and WILSHIN, who are jointly concerned, will SELL by AUCTION, at the MART, at an early date, a valuable FREEHOLD BUILDING ESTATE, known as High View Park, comprising 16a. 1r. 10p., lying immediately at the rear of and with approach from Leigham Court-road; also a contiguous Freehold Building Site of 2a. and 5p. in a new road intended to connect Canterbury-grove with Thurlby-road.

Particulars and plan, in due course, of Messrs. KINGSFORD, DORMAN, and Co., Solicitors, 23, Essex-street, Strand; of Messrs. WALFORD and WILSHIN, Auctioneers, Anerley, S.E.; and of Messrs. FIELD and SONS, as above.

By order of the Executors of Miss Susanna Roycroft.—Camberwell.—Leasehold Ground Rents.

MESSRS. FIELD and SONS will SELL by AUCTION, at the MART, on WEDNESDAY, JANUARY 18th, at TWO o'clock, in two lots, improved LEASEHOLD GROUND RENTS, amounting to £45 per annum, arising from and amply secured upon three shops and six dwelling-houses, being Nos. 202, 204, and 206, Camberwell-road, and Nos. 34, 36, 38, 40, 42, and 44, Mansion-street, adjacent, of the rack rental value of about £200 per annum.

Particulars of G. ASTELL HALL, Esq., Solicitor, 8, Gray's Inn-square, and of the AUCTIONEERS, 54, Borough High-street, S.E., and 52, Chancery-lane, W.C.

Old Kent-road.—Leasehold Investment.

MESSRS. FIELD and SONS will SELL by AUCTION, at the MART, on WEDNESDAY, JAN. 18, at TWO, three modern LEASEHOLD RESIDENCES, Nos. 93, 95, and 96, Avondale-square, in good residential locality, close to Old Kent-road Station, let and estimated to produce from quarterly tenants about £112 per annum, and held for about 60 years unexpired at ground rents.

Particulars of FREDK. W. FIELD, Esq., Solicitor, 52, Chancery-lane, W.C., and of the AUCTIONEERS, as above.

An Architectural Causerie.

It is curious to find, in the common names of the rooms we live in, traces of that great Norman inheritance which culminates in the cathedral, the castle, and the keep. Encumbered with a whole vocabulary of French and corrupted English words, domestic Architecture still awaits a Saxon revival which shall rid us of the chamber, the lobby, and the salon, and restore to us the frank dignity of the hall and the bower. The years that changed "my lady's bower" into "my lady's chamber," and ultimately into her "boudoir" (literally "sulking room!"), transformed at the same time the face of social and domestic life. The homely "kitchen" alone remained unaltered by the Norman tongue. The ancient hall gave place at last to the drawing room, and, like an architectural Cinderella, was humbled from its earlier glory, and set to mind coats and sticks at the door. In many other cases the survival of a Saxon, or even a fine mediæval word, has been at the price of its perversion to a narrow and purely arbitrary meaning. Why, for example, should the Danish "loft" and the Greek word "attic" (so unaccountably "lifted" to a top floor) have a pleasant and even romantic sound, while the old French "garret" is associated with all that is squalid and miserable in town life? The picture of the poor lovers in Heine's well-known song, the death of our own Chatterton—"the sleepless soul that perished in his pride"—all modern history and poetry, indeed, have linked the garret with the tenement "three pair back." And why, again, "a pair of stairs," when two succeeding flights in a house are never a pair, but consist of one long and one short one? The cellar, too (of Latin origin), once had a name to conjure with, and from its vaults were brought all manner of good cheer. This also has lost its dignity of repute, and begun to share the ignominy of its diminutive "cell." Not only have these arbitrary meanings gathered round colloquial words, but so definitely has etiquette classified them for use in speech that we can tell a well-bred man as readily by his room-names as by his avoidance of certain kinds of slang. How fatally, for instance, does he betray his social status who alludes to a ground-floor apartment as "the coffee-room," or calls his leisure place "the parlour!" Yet surely "parlour"—French though it be—is a more simple and natural term than what is left of "with-drawing-room," with its affectation of feminine privacy which, in fact, only covers a mixed assembly of acquaintances for half-an-hour after dinner. Even the "best room" of a labourer's cottage explains itself in a more honest way. These modern compounds—drawing room, dining room, breakfast room, sitting room, and so on—into which the builder so glibly divides his "superior residence" are far more clumsy and recalcitrant than the misapplications of archaic words. Moreover, the conventional arrangement of a house, and more especially the sharp dividing-line between sitting rooms and bedrooms, is clearly breaking down. The

life of a middle class family to-day often demands quite another house-plan than that which satisfied the generations in which the men of the house went regularly to town from nine till seven, and the ladies sat in the dining room till lunch time, and in the drawing room till it was time to dress for dinner. The increase of home work among students and the professional classes, and the pursuit of more serious occupations by women of leisure, demand a more hospitable and seemly privacy than that of the mere bedroom. To meet this development the suburban landlady evolved the "bed-sitting-room"—a comfortless compromise savouring always of the lodging-house, and suggesting only too painfully a "doubling of

tive name—will save us from the "combination-bed," which folds up by day into an intolerable semblance of a bookcase, with the bindings of Shakespeare and the Bible stamped upon the head. Happily, a sincerer treatment of living rooms, whether at home or in chambers, is now discouraging the diabolical fecundity of the amateur, and banishing the creations of the "Girls' Universal Adviser," under whose régime that which was a cabinet from noon to midnight became washstand from midnight to noon. One, perchance, of the needs of modern woman may yet be met by an advertisement on this wise: Bowers to let, furnished or unfurnished, near Chancery Lane. Apply, &c. E. W.

parts" between the toilet table and the board spread for a meal. But modern civilisation has worse in store, at least in the christening of its offspring. We are now threatened with the "combination-room," under which bewildering disguise the plebeian bed-sitting-room is to reappear. In certain London settlements of students and social enthusiasts, living under one roof and using common rooms for recreations and meals, the private apartments are built with a large recess for the bed, curtained off and ventilated by a light wooden screen over the curtain. In some cases this recess has a window of its own. The growing demand for some arrangement of this kind is undoubted. To contrive it in old houses is costly and difficult, but in new buildings, especially in detached or semi-detached plans, it may be carried out with very little trouble. At all events, it is better than the "bedroom and dressing room" of old days, in which the latter was often *minus* a fireplace, and therefore useless as a study or workroom. And it may be hoped that the combination-room—under some more attrac-

Radlett Parish Hall. THE picturesque little hall, of which we give a perspective view and plan, was erected by subscription as a Diamond Jubilee memorial at the village of Radlett, in Hertfordshire, and comprises a large hall, 50ft. by 26ft., for entertainments, a raised stage and retiring room, and also a class-room 14ft. square. The architect was Mr. A. G. Bond, B.A., A.R.I.B.A., and the contractors were Messrs. Whitehouse and Verdon, of Battersea. The contract price, inclusive of fencing and completing, was £760. The building was completed in August of last year. The hall is built of Luton wire-cut bricks, plastered internally and rough-cast externally, on a low plinth of Shenley red facing bricks; the porch and dormers are of fir with cathedral glazing; the roof of brown Broseley-pattern tiles externally, and an open plain roof inside with diagonal matchboarding. Kite's system of ventilating, and Musgrave's ventilating stoves are used.

Library Construction.* THIS book, being Vol. II. of the library series edited by Dr. Richard Garnett, deals exhaustively with the requirements and arrangements of public library buildings from the librarian's point of view. The first five chapters are devoted to such matters as the site, the general arrangement of the rooms, the construction, lighting, heating, and ventilation, the furniture and fittings; while the others consist of a description and criticism of most of the public libraries in England, with examples from the Continent and from America. The book is profusely illustrated by plans of nearly all the buildings discussed, and most valuable figured sections showing arrangements of stackrooms with book-racks, as well as details of all kinds of fittings, such as magazine tables, book-trucks, indicators, newspaper holders, and even a dusting machine. It is needless to say that such information as this is of great value and assistance to all architects engaged in designing libraries; and where the author passes on to discuss and criticise existing buildings, his remarks have a distinct value, as showing what arrangements are considered the most convenient by the librarians. It is refreshing to find that he is alive to the importance of a good site. The general indifference of those entrusted with their selection for public buildings has been a great cause of complaint on the part of the architects, who find themselves heavily handicapped from the start. In dealing with the construction of library buildings, the author has many sensible observations on protection from fire, and advocates cutting up book stores into small rooms with brick walls and with fireproof doors. He prefers a low pressure system for heating; for lighting, a plentiful supply of electric 8-candle lamps to the reading tables; and he considers ventilation a problem not yet solved. In the introduction the Editor of the series compares the development of public libraries, at the present day, to that of abbeys and cathedrals in Norman times, or of colleges and grammar schools under the Tudors, and thinks they may be considered as the characteristic buildings of the age. There is much in this point of view, though board schools, or, from another point of view, baths and washhouses, might put in a claim. While expressing a hope that our present day libraries may be as creditable architecturally as the buildings of the past, he points out various circumstances which make this ideal difficult of realisation, but he omits the main reason, that the people and those acting for them—such as library committees—have no intense desire that the buildings shall be masterpieces of Architecture; they want them convenient, and they do not care very much for anything else but the cost. Although there may be present, to some extent, the conflict he deplors between architect and librarian—the one striving for effect, the other for convenience, yet it is often the case that while two different arrangements may be equally convenient, one lends itself to a good effect and the other does not. It must not be forgotten, also, that librarians differ among themselves on minor points of arrangement and convenience. There is no doubt that a better understanding between those who design, and those who administer public libraries, is to be wished for; and there is equally no doubt that this book is calculated to promote this end. Mr. Burgoyne is to be congratulated on a book which is evidently the outcome of much labour and research.

A. R. J.

* "Library Construction," by F. J. Burgoyne, M.A. George Allen.

On Reflection.

Specification. MANY of our readers will turn with interest to the report given on another page of the discussion at last Friday's meeting of the Architectural Association (Discussion Section), when the subject of "Specification" was discussed, and several recent works on the subject were reviewed. As might be supposed, many different views were expressed, but there seemed to be a consensus of opinion, though not absolute unanimity, on these three points:—

(1) That the work of specification does not generally receive from architects the attention its importance deserves.

(2) That publications on the subject are welcomed by architects as aids in their work.

(3) That the form of publication which best meets their needs is that adopted in "Specification."

Our report shows that amidst the chorus of appreciation of the latest publication from the BUILDERS' JOURNAL Offices there were mingled criticisms on several points of detail. It will be found that in the next issue of "Specification" some of the grounds for criticism, to which reference was made, are removed, and some of the suggested improvements have been adopted.

A Board School Competition.

A CORRESPONDENT to a contemporary deserves the thanks of the Profession for having hastened to call attention to the manner in which the competition for the proposed new Board Schools at Dartford is being conducted; and we hope that this paragraph may further serve as a warning to other would-be competitors who should contemplate sending the guinea, which is demanded by the Board in their advertisement, before the "conditions" can be forwarded. In a certain sense, though not in a sense that will recommend it to architects, these "Conditions" may be considered to be worth a guinea, for we do not remember in the annals of public competitions to have ever met a more impudent imposition than that which the Dartford School Board would here foist upon the Profession. The "Conditions" reveal themselves to be so flagrantly inadequate, make such unreasonable demands, and offer such inconsiderable benefits to competitors, both by way of premiums or promise of commissions, that we are induced to think the promoters have come very nearly within reach of an indictment for obtaining their guineas upon false pretences. Under these "Conditions" the usual complete set of drawings is required for schools to accommodate boys, girls, and infants to the total of 1550, but it is only intended to build the boys' school, which amounts only to about one-third part of the bulk of the whole design. The Board does not undertake to appoint the author of the first or any award to carry out the work, and makes no promise to employ the architect who may be commissioned to build the boys' school, upon the erection of the remaining portions of his design, should they ever be executed. The premiums are to include attendance before the Board to enable its members to satisfy themselves as to which is the most suitable design, and are to include all incidental expenses. And the premiums are precisely stated to be of the value of *Thirty* and *Ten* guineas respectively. Now the cost of building a Board school for 1550 children may be stated at a reasonable computation to be about £14,000. The average value of premiums offered in competitions for a design estimated to cost this sum is £170. Thus the Dartford School Board, while it has availed itself of all the monstrous precedents deforming our system of competitions which make the obligations of the promoters always

vague and ambiguous, and has also fallen to the expedient of protecting its liabilities by assuming the incentive to competition among architects to be not the chance of a Commission, but the premium offered, has yet, besides including exceptional and extraordinary services in the amount, reduced that premium to one quarter what has hitherto been usually proffered.

A Comment.

AT the same time that we repudiate such methods as those of the Dartford School Board, we must point out, as we have so frequently had cause to do in this journal, that the promotion of an Architectural Competition is wholly and solely a matter of business, and that any Board of Guardians or Corporation may hold its offer completely justified by the fact of its acceptance by those to whom it is made. Moreover, this is hardly a case of tyrannic capitalism, such as has provoked outcry and special commissions in other connections. Architects may be considered to be in a perfectly unembarrassed and independent position, the embroglio in which they have involved themselves can provoke no commiseration from the public, but derision only; and, apart from the lack of candour in the terms by which competitors are tempted to send in their guineas, it cannot be held that the action of the Dartford School Board reflects morally upon that body in any way. The correspondent to our contemporary, to whom we have already referred, says:—"The Board has decided to take the high-handed course of retaining the deposits unless a *bona-fide* design is sent in," apparently unconscious that this, almost without exception, is the condition upon which the fee is tendered whenever it is required; and that such a fee, ranging from five shillings to five pounds, is a quite general feature of public competitions. The writer seems also unconscious of the fact that it is not unusual, but quite usual, for the promoters to state in the "Conditions" that they do not bind themselves to commission the author of the first award. It has been found of public competitions in England, that in 54 per cent. of cases the promoters are not bound to accept the "first award," and, in 35 per cent., they are not bound to accept "the first or any award." Thanks to the timely warning that has been given, there is no reason why anyone should be tempted by the overtures of the Dartford School Board, and we heartily hope that the Board will be forced to amend the terms of its "Conditions."

Some six weeks ago we referred to a verdict for £300 damages which was granted by a jury to a plaintiff who claimed compensation for loss of part of a foot through the fall of an electric light standard, which was being erected in the Chalk Farm Road; and we now learn from the Bolton County Court that an award of £120 has been made to a joiner's labourer, by way of damages for the loss of the little finger of his right hand. He was engaged by a local contractor in the erection of a new fire station for the Bolton Corporation when an iron girder fell and his finger was cut off. In commenting upon this latter case the *Globe* remarks that, though in the past it was considered a distinction to be worth one's weight in gold, the value of a British workman seems nowadays to be about his weight in five-pound notes, and suggests that, for the benefit of contractors, an anatomical diagram of a workman should be published, with the average value at law of each part figured thereon. The time seems to be approaching when a maimed workman will be sought after by contractors in favour of a sound one. A man with only one leg or nine fingers may be considered to be economical in event of accidents. There would be less of him to pay for.

MODERN OPERA HOUSES AND THEATRES.*

BY EDWIN O. SACHS.

WE have received the third and concluding volume of Mr. Sachs exhaustive and valuable work on Modern Opera Houses and Theatres. In this great and important work, which has occupied three years in publication, the first volume appear-

has accomplished his ambitious task. The book stands, and will stand for many years, as the most complete and comprehensive survey of modern theatres, their design, management, and construction, in existence. This, the third volume, differs from those which have preceded it in consisting mainly of letterpress, illustrated indeed with 850 illustrations in the text, but containing only twenty full-page plates, as compared with the one hundred each which appeared in Volumes I and II. The two first chapters deal with General Arrangement and Auditorium Arrangement; and the remaining five concern such particular and technical

feature of the volume, and which is, indeed, characteristic of the thorough methods with which Mr. Sachs has dealt with all aspects of his subject, is a series of tables giving full and complete dimensions, with cost of construction, period of erection, and seating capacity of fifty-five English and Continental theatres, supplemented with a plate giving comparative block plans of all these theatres drawn to a uniform scale, so that the relative significance of his figures may be grasped at once.

Mr. Sachs hopes of his book that it "may in some slight measure tend to raise the standard of the housing of the drama in our Metropolis,

GRAND STAIRCASE, PARIS OPERA HOUSE. FROM "MODERN OPERA HOUSES AND THEATRES."

ing in May, 1896, and the second in July, 1897, the author has not confined himself to the interests of the Architectural expert merely, but has also, as he says, considered those of "the actor, theatre manager, lessee, public official, critic, and playgoer," and he is to be congratulated upon the success with which he

* Modern Opera Houses and Theatres. Examples selected from playhouses recently erected in Europe, with a short descriptive text, and a treatise on theatre planning and construction, with supplements on stage machinery, theatre fires, and protective legislation. By Edwin O. Sachs, architect. Three vols., £15 15s. nett. Published by B. T. Batsford, 94, High Holborn, London.

aspects of the subject as Communication, Service, Construction, Equipment, and Safety of Life. In the first volume, Mr. Sachs stated the main groups or classes into which theatres might be divided as being, court, national, government, municipal, subscription, and private theatres; and in this volume he enters into details of the general conditions and particular requirements of a modern playhouse with special reference to the financial aspect of the subject, and with regard to matters which should regulate the staff employed in working such a theatre. A particularly interesting

and that the examples presented in this work may assist all those who are interested in theatres—whether resident on this side of the Channel or abroad—in determining the character of the future playhouses of Europe." His modest ambition certainly deserves to be justified.

But here in England there are causes tending to prejudice the development of theatre Architecture which do not exist on the Continent. In the first place, of the five different orders or classes into which, as above described, Mr. Sachs divides modern theatres

and opera houses, practically only one, the last on his list, viz., the Private Theatre, has any existence. Our theatres being thus merely speculations on the part of private individuals, lose the national or municipal importance which distinguishes many Continental theatres, and which has set a model and raised the popular idea of what a theatre should rightly be among other European peoples. In point of planning, upon which Mr. Sachs lays so much stress, English architects rarely have any opportunity of doing justice to themselves or their subject, for the theatres they are commissioned to build are allotted to such sites as may be most readily and cheaply acquired, and necessity rather than expediency dictates the possibilities and limits of their plan. For this same reason the æsthetic qualities of designs for theatres in England are greatly prejudiced, and the architect has to consider himself fortunate if he can get any distinctive character into his theatre which shall distinguish it from other buildings in the long rank of shops and business premises in which it is usually set. An example of the insuperable difficulties which beset those who are ambitious to build a useful and imposing theatre, may be instanced in the "Royal English Opera House" now known as the "Palace Theatre." The plan was seriously hampered, and, for all the cleverness of the architect who designed the wall-veil, it is obvious that he had no opportunity to design such a building as would satisfy his idea of what a theatre should be. And here again lies another difficulty in the way of theatrical Archi-

itecture. Our theatres are not built by architects, but by theatre specialists, who are expected to combine the responsibilities of a financial agent with the multifarious duties of engineer, architect, and often company promoter and theatrical speculator. Mr. Sachs tells us that he has known several cases where the architect has even become a part-lessee, a part-owner, and a part-mortgagee; and he recalls that the late Mr. C. J. Phipps spoke to him with regret of the fact that in the course of an important theatrical enterprise, with which he had been recently connected, he had little time to give to the rendering or decoration of the structure in question.

We believe that Covent Garden Opera House was the last building of this kind which was placed in the sole and entire charge of an architect. The present usage commonly employs an architect to design the wall-veil of the principal elevations, and hands the internal design over in bulk to a firm of decorators. To this we may add that the promoters, in their anxiety to secure an early profit on the money paid for the site, have no care so that the building is raised quickly, has the requisite seating accommodation, and is cheap and showy. Mr. Sachs reverts to a topic which he referred to in one of the earlier volumes, and speculates on the possibility of endowed or subsidised state or municipal theatres. "There is," he says, "a growing feeling, in London and many of our large provincial centres, that the representation of plays should meet the recognition and encouragement of the public authority, whether the latter represents the central government or an individual com-

munity," and he expresses himself as inclined to think that the London County Council may soon seriously consider the advisability of officially supporting both opera and drama. We are not so sanguine as is Mr. Sachs in this matter, but the enormously increased popularity of operas and stage plays in England during the last fifteen years, and the distinction a few years back bestowed for the first time upon an actor, do certainly point to the possibility of such a course at some future date. We should welcome the innovation warmly, both as tending to improve the popular taste in architectural, histrionic, and operatic art, and as opening a new and legitimate field of design to our architects.

The illustrations of staircases appearing in these pages are from Mr. Sachs' book, and show the staircases at the Opera House, Stockholm; the grand staircases at the Court Theatre, Vienna, at Odessa, and at the Paris Opera House.

THE FEUDAL PRINCIPLES OF REAL PROPERTY LAW.

BY WILLIAM H. STACPOOLE, LL.D.,
Barrister-at-Law.

V.

THE word *seisin* (*a*) is used so frequently in real property law that I had better explain it before we go any further. Absolute ownership of land is unknown to English law. As we have already seen, all land in England is supposed to be held, either mediately or immediately, from the Sovereign. The feudal reasons of this were explained in the first article, and it is important to remember that, though knight's service, which was the most genuine species of feudal tenure, was abolished by 12 Car. II., c. 24, the feudal system of land tenure was not abolished by that or any other Act, and, consequently, remains still in force, in so far that to the present day this feudal holding of land from someone else is the highest kind of ownership the law recognises in land. It will also be remembered that leaseholders for a term of years were in early times not looked upon as having any ownership in the land, but merely as bailiffs, who had to account to the lord for the profits at a fixed sum. Now the word *seisin*, which originally meant nothing more than possession, has from a very early period been used to mean something more than bare possession, namely, feudal possession, or possession as a feudal tenant. A freehold means such a holding of land as is worthy of a free man. To say, then, that a man is *seised* of land must mean not merely that he has the bare possession of the land, but that he is the owner of the freehold thereof, for only a free man would have been considered worthy to be accepted as a feudal tenant.

Seisin, then, coupling as it does the conception of possession with that of feudal tenure, is a useful term to distinguish the feudal ownership of land, which, though not absolute, is the highest our law permits, from other kinds of pseudo or temporary ownerships belonging to other tenures.

We have now to consider copyholds which, with frankalmoin and grand serjeanty, were, it will be remembered, preserved by 12 Car. II., c. 24.

There were, as we have seen, four ancient species of tenure in England, viz.:-

1. The tenure in chivalry, or knight's service, where the service was free or honourable, but necessarily, from its military nature, *uncertain*, and, therefore, incapable of being determined beforehand.
2. Free socage, where the services were both honourable and *certain*, so that they were capable of being pre-arranged.
3. Pure villainage, where the services were both base and *uncertain*.
4. Villain socage, or privileged villainage, where they were base but *certain*.

The first two are the parents of our freehold,

(a) Derived from the old High German word "sazjan."

STAIRCASE, COURT OPERA HOUSE, STOCKHOLM. FROM "MODERN OPERA HOUSES AND THEATRES."

the latter two of our copyhold estates. To understand how copyholds sprang from these base or villainous tenures we must consider the origin and nature of manors which date back to Saxon times, and of which Blackstone's account is, perhaps, at once the most succinct and clear.

"A manor, *manerium*, a *manendo*," he says (b), "because the usual residence of the owner seems to have been a district of ground held by lords or great personages, who kept in their own hands so much land as was necessary for the use of their families, which were called *terre dominicales*, or *demesne* lands; being occupied by the lord, or *dominus manerii*, and his servants. The other, or tenemental, lands they distributed among their tenants; from which the different modes of tenure were distinguished by two different names. First, book-land, or charterland, which

is, two tenants at the least, the manor itself is lost."

All manors now existing must, I may here observe, be at least as old as the eighteenth year of the reign of Edward I. The reason of which was as follows: Prior to this date the greater barons used to grant smaller manors to be held from themselves by inferior persons, and these inferior persons again granted smaller manors to be held of themselves, and so on downwards, the process being called subinfeudation, or the creation of sub-feuds. At last the lords paramount found that their feudal profits of wardships, marriages, escheats, &c., were falling into the hands of these inferior lords, and to prevent this they procured the passing of a celebrated statute which is called the statute of *quia emptores* (c) from its opening words, and which directs that upon all sales or feoffments (d) of land, the feoffee shall hold the

To return now to folkland, which is the origin of copyholds. "Under the Saxon government there were, as Sir William Temple speaks, a sort of people in a condition of downright servitude, used and employed in the most servile works, and belonging, both they, their children and effects, to the lord of the soil, like the rest of the cattle or stock upon it. These seem to have been those who held what was called the folkland, from which they were removable at the lord's pleasure.

In what respect, it may be asked, if any, was the state of these villains, which continued long after the Norman Conquest, different from that of pure slavery? The answer seems to be, that the only quality in which it was distinguished from pure slavery was, that having been admitted to the feudal oath of fealty, the villain tenants had conferred upon them a right of protection, which raised them to a state

GRAND STAIRCASE, ODESSA. FROM "MODERN OPERA HOUSES AND THEATRES."

was held by deed under certain rents and free services, and in effect differed nothing from free socage lands; and from hence have arisen most of the freehold tenants who hold particular manors, and owe suit and service to the same. The other species was called *folk-land*, which was held by no assurance in writing, but distributed among the common folk or people at the pleasure of the lord, and resumed at his discretion, being indeed held in villinage. The residue of the manor, being uncultivated, was termed the lord's waste, and served for public roads, and for common pasture to the lord and his tenants. Manors were formerly called baronies, as they still are lordships; and each lord or baron was empowered to hold a domestic court, called the court baron, for redressing misdemeanours and nuisances within the manor, and for settling disputes of property among the tenants. This court is an inseparable ingredient of every manor, and if the number of suitors should so fall as not to leave sufficient to make a jury or homage, that

same, not of his immediate feoffor, but of the chief lord of the fee, of whom such feoffor himself held it. This statute, while putting a stop to the process of subinfeudation, gave at the same time a free power of alienating lands. I shall have to refer to it again, but I may mention here that to the present day its effect is this: That the holder of an estate in fee simple (which is the largest estate the law recognises, being an estate to a man and his heirs simply and without restriction), while he can at will substitute another person for himself the holder thereof, so that the estate will last so long as the other person has heirs, cannot create a tenure by which this person holds under him in fee simple. This is shortly expressed by saying that the statute of *quia emptores* allows alienation, but forbids subinfeudation.

(c) 18 Edward I. c. 1. Ancient statutes are frequently called by the words with which they begin.

(d) A feoffment is a deed evidencing the transfer to another person of the feudal tenure. The person who transfers is called the feoffor, the person to whom the tenure is transferred the feoffee.

superior to that of downright slavery, though inferior to every other condition (e).

Such, then, was the original condition of these villain tenants, and it continued far into the fourteenth century (f). They were practically the slaves of the lord, and they held their little plots of land merely at the will of the lord, and by services that were base and uncertain.

Gradually, however, the common law, of which custom is the life, came to regulate this originally quite arbitrary tenure. The tenant, said the law, holds, no doubt, by the will of the lord, but that will is not to be regarded as a merely capricious one, but such a will as is agreeable to the customs of the manor, which customs were preserved and evidenced by the rolls of the several courts baron in which they were entered. "And, as such tenants had nothing to show for their estates but these customs, and admissions in pursuance of them,

(e) 2 Bl. Com. C. 6, Vinogradoff, Villainage in England, Essay 1, c. 1.

(f) Vinogradoff, *Ib.*

(b) 2 Bl. Com. c. 6.

entered on those rolls, or the copies of such entries witnessed by the steward, they now began to be called *tenants by copy of court roll*, and their tenure itself a *copyhold*" (g).

Copyholders, in fact, are, as Blackstone says in the same place, no other than villains who, by a long series of immemorial encroachments on the land, have at last established a customary right to those estates, which before were held absolutely at the lord's will. Nevertheless, though the tenure of the copyholder has been so strengthened and protected by custom that, as Blackstone says (h), "he has in many places an interest full as good, in others better than his lord," still we must remember that in legal intendment his estate is, to the present day, nothing more than an estate at will. It is true that it can now be enfranchised (converted into a freehold) compulsorily at the instance of either the lord or tenant (i), but until it is enfranchised it remains simply an estate at will, that is, one that can be determined at the will of either party (albeit the will is to be determined by the customs of the manor), which is the lowest kind of estate known to the law.

So firm is now the copyholder's tenure, that the fact of his estate being in law a mere estate at will may seem of little practical moment, yet it is productive of consequences that are of great substantial importance. Thus, the copyholder being a tenant at will (never mind how the will is to be interpreted), the seisin of the land lies not in him, but in the lord. The result of this is rather peculiar as regards both lord and tenant. On the one hand, the lord having the seisin, or feudal ownership of the land, has the right to all timber growing on the surface, even though planted by the tenant, and to all mines and minerals below it. Hence the proverb, "The oak scorns to grow except on free land," for timber is rarely found on land that is subject to copyhold tenure. On the other hand, owing to the rights which custom has given to the tenant, the lord cannot without his leave come upon the land to open his mines or fell his timber.

Again, the seisin being in the lord, the tenant cannot, in the absence of a special custom, without forfeiting his land, grant a lease of it for more than one year; for to grant a lease for a longer period, without the authority of a special custom, would be to impose on the lord a tenant of his own lands without the authority of custom, and custom is the life of all copyhold assurances (j). Neither can the tenant commit either what is called voluntary waste by opening mines, cutting down timber, or pulling down buildings, nor permissive waste by neglecting to repair. For the land, with all that is under it or on it, belongs to the lord, the tenant having only a customary right to enjoy the occupation (j).

Another consequence of both of the seisin being in the lord and of a copyhold being an estate at will according to the custom of the manor, is that when copyholds are conveyed from one person to another, their transfer must be conducted in conformity with the old method which was adopted when transfer of them was first allowed, by which the outgoing copyholder first surrenders the land into the hands of the lord or his steward, who then admits the transferee or incomer. The surrender of the transferor and admission of the transferee were made at what was called the Customary Court, which was a sitting of the Court Baron, attended by copyholders. Formerly it was necessary that two copyholders should be present to form a court, but now the Customary Court may be held without the presence of any copyholder. (k)

Ancient demesne and customary freeholds are two forms of copyholds which require a few words of explanation, though they are not of any very great practical importance at the present time.

The former, which is described by Blackstone

as "no other than an exalted species of copyholds," (l) seems to have descended from privileged villinage, as common copyhold did from pure villinage. (m) "Ancient demesne," says Blackstone, "consists of those lands or manors, which, though now perhaps granted out to private subjects, were actually in the hands of the Crown in the time of Edward the Confessor or William the Conqueror, and so appear to have been by the great survey in the Exchequer called Domesday Book." Of the tenants in these lands, he says, "they had many immunities and privileges granted to them; as, to try the right of their property in a peculiar court of their own (n), called a court of ancient demesne, by a peculiar process, denominated a writ of *right close*: not to pay toll or taxes, not to contribute to the expenses of knights of the shire, not to be put on juries and the like." (o). Tenants in ancient demesne held by services that were base but certain, and they could not alienate their tenements by grant or feoffment, any more than pure villains could, but had to surrender them to the lord, or his steward, to be again granted out and held in villinage. (o). There is, however, this difference between the surrender of common copyholds and ancient demesne, that in the latter case it is not used to say "to hold at the will of the lord," but only "to hold according to the custom of the manor."

Customary freeholds are copyholds in which the tenant holds by copy of court roll, but not expressed to be at the will of the lord. These, like tenures in ancient demesne, "differ from freeholds by one especial mark and tincture of villinage, noted by Bracton and remaining to this day—viz., that they cannot be conveyed from one man to another by the general common law conveyance of feoffment, and the rest, but must pass by surrender to the lord, or his steward, in the manner of common copyholds (o)." Whether what are called customary freeholds are really freeholds or not, that is to say, whether the seisin of the land is in the lord or the tenant, was for long a matter of dispute amongst the learned, but the courts of law have now settled that the seisin, and therefore the freehold, is in the lord and not in the tenant. Still, it may be well to remember that in the opinion of so great an authority as Mr. Williams, "a recurrence to first principles seems to show that the question, whether the freehold is in the lord or in the tenant, is to be answered, not by an appeal to learned dicta, or conflicting decisions, but by ascertaining in each case whether the well-known rights of freeholders, such as to cut timber and dig mines, are vested in the lord or in the tenant." (p).

Copyholds came into existence at a time when only freehold estates in land were recognised by law, and hence they were moulded, according to the customs of different manors, into forms analogous to those of freehold estates; so that there are copyhold estates in fee simple, in fee tail, and for life; and in this way they came to be classified as real estate, from their formal resemblance to freeholds to which alone the expression real estate primarily applied. Leaseholds, on the other hand, not being recognised by law till a later period, were left to belong to the class of chattel or personal property, though they are often spoken of as chattels real, as having been derived from real estate.

Copyholds thus occupy an anomalous position. They are not freeholds, being in strict law merely estates at will, and such as were held originally by base services, nevertheless, while an estate for any term of years, however long, is merely a man's chattel or personal property, a copyhold is his real property.

So far we have briefly considered the nature and origin of the tenures by which real property is held in England.

CASKIEBEN HOUSE, near Aberdeen, the residence of Mr. Pirie, M.P., has been burned down.

HOUSE-PLANNING FROM THE ÆSTHETIC POINT OF VIEW.*

By H. HEATHCOTE STATHAM.

(Continued from page 362.)

THOSE who were present at Mr. Aston Webb's charming little lecture to the Class of Design at the beginning of the session will not have forgotten his remarks on the advisability of having a little mystery or surprise in the planning of a house; inasmuch as the host generally rather enjoyed showing his guests over the house, there was not the same occasion for plain and direct planning as there was in a public building where strangers had to find their own way about. I quite agree with that as far as it refers to the average-sized dwelling-house. But where you come to the largest class of mansion, mystery-planning may become an inconvenience rather than an enjoyment to the guest. Your host may give himself the pleasure of escorting you from the smoking room through a labyrinth of passages to your bedroom door at night, but in the morning you may find yourself under the necessity of ringing for a

SERVANT TO SHOW YOU THE WAY

to the breakfast room. This is a mere point of convenience, not of Art, but it is worth consideration. It is a nuisance to be losing yourself in a great house, and getting into the wrong rooms. But this is a minor consideration in comparison with the æsthetic one. It is often urged, I know, that the rambling and irregular house is the more homelike. But it is forgotten that a mansion on the largest scale may (or rather should) aim at something more than homeliness. It is to some extent a house of state; it should aim at the qualities of stateliness and dignity. And it is here that the great charm of house architecture comes in. Here there is the opportunity of combining architectural dignity with novelty and originality of grouping; the interest of arranging and shaping rooms so as to combine architectural effect with convenience. There are no by-laws or requirements of public bodies to hamper the architect; if his client is wealthy and really wants a fine and impressive house, the architect has the opportunity of evolving and shaping a new and original architectural creation which may be of the highest order, and imparting to it the dignity and symmetry which should belong to an architectural design thoroughly thought out and modelled. To adopt the rambling plan is to throw away a great deal of this opportunity. The rambling plan is not shaped at all, it is merely thrown together; it is supposed to afford a basis of picturesque effect, which really means a crowding together of different blocks of building, with a tower at some corner where you do not expect it, without any real design at all.

THE PICTURESQUE,

in that sense, is not a difficult business; but what has become of the dignity which should belong to the great house of the neighbourhood? "The stately homes of England," as they are called in some popular ballad, are stately no longer. Compare, for example, the block plan of Castle Howard with that of one of the rambling plans; the one is obviously the foundation for a dignified and grandiose mansion; the other may have character but it can have no grandeur; it is a shapeless plan destitute of any leading idea. It is worth while to endeavour to realise what was the ideal mansion of the great philosopher of the Elizabethan era, when he published, towards the latter end of Elizabeth's reign, his famous Essays, including the one "On Building."

IN BACON'S TIME

the courtyard or quadrangle system of planning was still in favour, and he requires no less than three courtyards before you get to the

* A paper read before the Architectural Association on Friday, January 6th, 1899.

house, an arrangement which I should think has never been carried out in actual building, unless it were a Babylonian palace or an Egyptian temple. The three courts are to form a kind of *crescendo* for the state approach to the house; first "a green court with a wall about it; next a court of the same, but more garnished with little turrets, or rather embellishments on the wall; and a third court to make a square with the front" (the front of

England. This is the only indication of style in architectural detail that can be extracted from the description. When we come to the house itself, the front is to have on one side a great banqueting hall 40ft. high "for feasts and triumphs;" this is to be "above stairs" (i.e. it is to be raised on a lofty basement story), with a room for preparation under it. The other side of the house is to be in two stories, the main one divided into a hall

centuries. Beyond this front is then to be a fair court ("quadrangle") but three sides of it a lower building than the front; the return on the banquet side to be all stately galleries, with three or five cupolas in the length of it; the other side to be ordinary presence chambers and some bedrooms; but all three sides to be "a double house without through lights on the sides, that you may have rooms from the sun both for forenoon and afternoon." This is

GRAND STAIRCASE, COURT THEATRE, VIENNA. FROM "MODERN OPERA HOUSES AND THEATRES."

the mansion to form one side of it), "but not to be built nor yet enclosed with a naked wall, but enclosed with terraces leaded aloft . . . and cloistered on the inside with pillars, and not with arches below." The last words are rather obscure. I think there ought to be a comma after "arches," and that he merely means that

HE WISHES THE CLOISTER

to be a colonnade and not an arcade; an indication of the Renaissance taste for columns which was just then beginning to reach

and a chapel, and "at the farther end a winter and summer parlour;" this looks as if one parlour was to face to the front and the other to the inner quadrangle, that on the sunny side being of course the winter parlour; in that case, "the farther end" means the end farthest from the centre axis of the building.

THE TWO SIDES OF THE FRONT

are to be "uniform without, though severally partitioned within," a principle which was destined to be only too well carried out in many an English house of the following two

rather lightly said, and could surely have hardly applied to the side with the "stately galleries." As to communication, probably Bacon counted on all these rooms opening out of each other, as they do all round in such mansions as

BURLEIGH HOUSE

and others, and even with the greater part of Hampton Court, which is, of course, a good deal later. Four staircases were to be placed in turrets projecting into the court at the re-entering angles. Embowed windows have

their advantages, "they be pretty retiring places for conference; and, besides, they keep both the wind and the sun off, for that which would strike almost through the room doth scarce pass the window. But let them be few; four in the court and on the sides only." He probably means two on each of the return wings; the front wing could not have one, as the centre entry to the quadrangle would be in the way. The quadrangle is not to be paved, "for that striketh up a great heat in summer and cold in winter;" only with paved side and cross walks, and the four spaces laid out in grass. Beyond this court is to be another of the same size and height, which (outside) is to be environed with

THE GARDEN ON ALL SIDES,

and (on the inside) "cloistered on all sides upon decent and beautiful arches, as high as the first story." This cloister, apparently, is to be an arcaded one. "On the under side, towards the garden, it is to be turned into a place of shade, and only have windows towards the garden"—i.e., on the outer side of the buildings. Then, after a reference to the arrangement of the rooms on the fourth or farther side, he adds that here there is to be "on the ground story a fair gallery open, upon pillars." This description forms a curious coincidence with the actual arrangement of the Second Court of Trinity College, Cambridge, where there is an arcaded cloister on three sides, and an entirely open space on the fourth side, with piers to carry the library above. Bacon adds that the third story, on this farther side, is also to be "an open gallery on pillars, to take the air and freshness of the garden." In this upper gallery there were to be fountains running from the walls. One further detail: "At both corners of the further side, by way of return, let there be two delicate or rich cabinets, daintily paved, richly hanged, glazed with crystalline glass, and a rich cupola in the midst." I confess I cannot make out exactly where these "delicate cabinets" were to be placed. Such is Bacon's idea of a great mansion on the

QUADRANGLE PRINCIPLE OF PLAN.

It would not be a bad study for the Academy or the Institute to set as the subject of one of their prizes—the Travelling Studentship or the Soane Medallion—to restore Bacon's mansion in plan, section, and elevation, and make a bird's-eye view of it. Bacon, it may be observed, deals only with the superior portions of the mansion. "As for offices," he says, "let them stand at a distance, with some low galleries to pass from them to the palace itself." This is really much the way they were placed by Vanbrugh at Seaton Delavel, only that Vanbrugh had them flanking the front or entrance courtyard of the house; masked by the colonnades, it is true, but still pretty well in evidence, whereas I think Bacon wanted them

OUT OF THE WAY OF NOTICE

altogether. "Offices" probably did not with him include the kitchens, as he rather implies, in the course of his essay, that these would be in the basement of the main building. The quadrangle system of plan is no doubt one of the best for combining a considerable degree of architectural effect with a certain degree of retirement and domestic feeling. It was not the most effective for an exterior view, as in most cases one only gets the architectural impression of the front; nor is it the most wholesome form of plan in a sanitary sense. The E plan, with or without the centre shank to the E, gets over two of these objections, and, especially with a low screen or colonnade across the fourth side, is highly effective architecturally; but it introduces the new objection, for internal convenience, that each end of the returns is a cul-de-sac.

(To be concluded.)

R.I.B.A.

AWARD OF PRIZES AND DISCUSSION ON BUILDING BYE-LAWS.

At the meeting of the Royal Institute of British Architects last Monday evening, the chair was taken by Mr. W. J. Locke. The first business was the announcement by the chairman of the awards of prizes and studentships for 1898-99. These were as follows:—

The Institute Silver Medal and twenty-five guineas, for essays on the use and value of colour in Architecture:—H. C. Corlette. The Chairman remarked that the essays this year had been of exceptional excellence.

The Institute Silver Medal and ten guineas for measured drawings of ancient buildings in the United Kingdom or abroad.—Henry Ernest Kirby (subject, St. Paul's Cathedral), Medals and £5 5s., Heaton Comyn (subject, St. Catherine's College, Cambridge), and Edward F. Knight (subject, Southwold Church).

The Soane Medallion and £100 (to be devoted to Continental travel), for a design for a concert hall.—William Arthur Mellon. Eleven designs were sent in this competition.

The Pugin Studentship: Silver medal and £40 (to be devoted to travel in the United Kingdom) for sets of drawings.—J. Hervey Rutherford. This, said the chairman, was the largest and finest competition on record, and the following additional prizes had been awarded: Medal and ten guineas, E. H. Bennett; medal and five guineas, Ramsay Traquair; certificate of honourable mention, Albert Herbert.

The Owen Jones Studentship: Certificate and £100 (for travel and study of colour).—John Stewart.

The Goodwin Bursary: Silver medal and £40 (for travel outside the United Kingdom).—E. W. N. Wonnacott.

The Tite Prize: Certificate and £30 (for travel in Italy), for designs for a royal mausoleum.—James B. Fulton. Eight designs were sent in, and extra prizes were awarded as follows: Medal and five guineas, Alexander M. Gardner; certificate of honourable mention, Ernest Jago.

The Grissell Gold Medal and ten guineas, for designs for a fruit, flower, and vegetable market.—G. Gardner Wallace. Certificate of honourable mention, Charles A. Daubney.

The meeting then proceeded to the consideration of the following resolutions moved by Mr. Lacy W. Ridge:—

1. That the administration of local building bye-laws in rural districts is a matter calling for the action of the Royal Institute.

2. That the Council be requested to communicate with the Local Government Board on the subject, and to appoint a special committee to consider and take action thereon.

3. That matters of sanitation, including the preparation of the site for building, should in all cases be carried out under the supervision of the local authorities. That where separate tenements adjoin they should be divided by party walls of incombustible material. That the interests of the public in buildings in rural districts are not such as to justify any further interference on the part of the public authorities with the construction of buildings.

In support of these propositions Mr. Ridge pointed out how the restrictions imposed by local bye-laws in rural districts added to the difficulties and duties of architects and to the expenses of their clients. He recommended that the Local Government Board should be approached on the matter because the consent of that body was necessary to any local bye-laws. He considered that the local authorities in rural districts were not to be compared for business qualities with those in the large towns; nor were they able to pay such competent men to act as surveyors. These rural councils were not in a position to frame their own bye-laws, but obtained them from the Local Government Board; therefore it was desirable to approach that Board to get them to reconsider the model bye-laws they put forward for the guidance of local authorities. Since those bye-laws were framed, a new

Metropolitan Building Act had been passed, under which there was much greater liberty of building and design than under the old Act. The model bye-laws, however applicable to large towns, were perversely inapplicable in rural districts. He failed to see that there was any necessity at all for the vast majority of the bye-laws that were enforced in country places. If they could persuade the Local Government Board to draw up a series of bye-laws that would apply to large towns, another for towns of smaller dimensions, and a third series for rural districts, architects would be saved much unpleasant supervision and unpleasant intercourse with men who knew very little about building, though much about the particular bye-laws they considered themselves bound to enforce. He objected to these matters being under the jurisdiction of country magistrates, and to the system of accumulative penalties for infringements of the bye-laws.

The resolutions were seconded by Mr. Woodward, who remarked that architects were subject to "a policy of pin pricks," the restrictions imposed being often on matters absolutely trivial in their character and of no use whatever to the client or the public.

Mr. Matthews complained of the use often made of the model bye-laws issued by the Local Government Board; they were adopted too much in their entirety by the local bodies, instead of being taken as models and adapted to the requirements of the particular neighbourhood.

Mr. Fleming, while heartily agreeing with the first two resolutions, suggested that it would be unwise to tie the hands of the committee to be appointed by expressing opinion on the matters of detail referred to in the third resolution. Succeeding speakers took a similar view.

Mr. Gordon Smith assured the meeting that any representations from the R.I.B.A. would be received by the Local Government Board with the greatest respect and attention. At the same time, he could not agree with all that had been said. He thought there was a great absence of knowledge on the part of architects as to the laws relating to building. Mr. Smith proceeded to explain the various Acts which governed the action of the Local Government Board in respect to their attitude to local bye-laws. He was not prepared to admit that Rural District Councils were less competent to make bye-laws than Urban District Councils, and he pointed out that those who were dissatisfied with the decisions of country magistrates could appeal to a higher court.

Mr. Ridge briefly replied, and, accepting the suggestions of previous speakers, withdrew his third resolution. The first two resolutions were then put to the meeting and carried unanimously.

At Reading, during the recent gale, one of the spires of the ancient parish church of St. Lawrence was blown off.

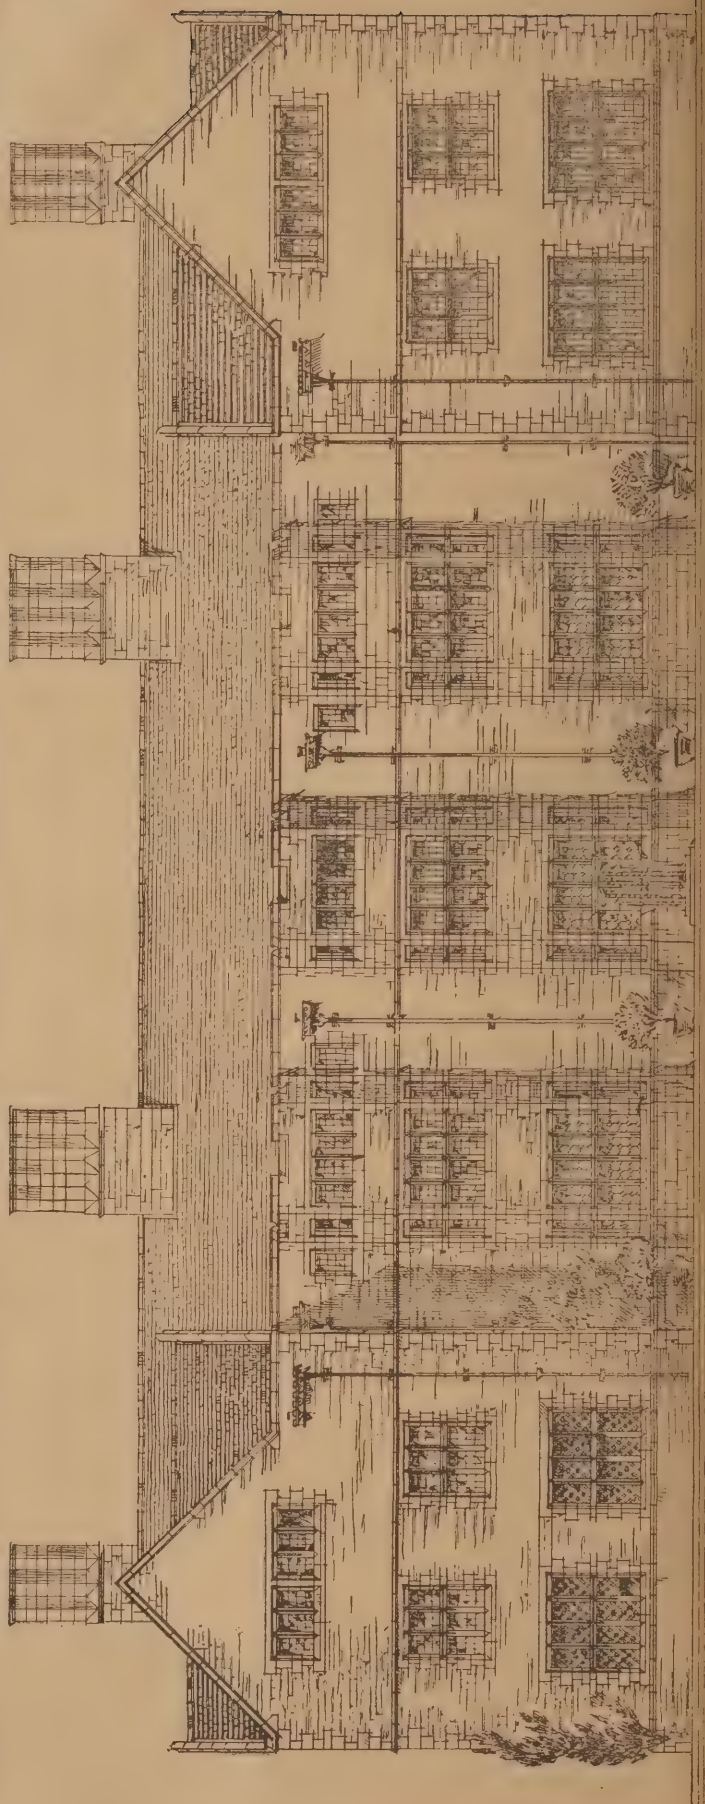

It is proposed to erect a temperance Institute at Dudley, at a cost of about £5000. The Institute would contain a large hall, with a gallery capable of seating 600 people, reading and recreation rooms, gymnasium, and a café.

An illustration has just been afforded of the immense increase in value of City land. The site of the Methodist Centennial Hall in Bishopsgate Street cost about sixty years ago £15,000, and a similar sum was spent on the Hall. Recently a firm in the City made an offer for the freehold of no less a sum than £230,000. This works out at something like £27 a square foot, but the offer, magnificent as it seems, was refused by the owners.

The Southport Town Council has adopted a recommendation of the Parks Committee that trees be planted in the gardens on both sides of Bath Street in order to beautify the town. Other suggestions were made by members of the Council in favour of an extension of the principle of beautifying the streets. Alderman Griffiths remarked that they spent £1100 a year in cleaning people's back yards, which visitors did not see, whereas this work would be visible to all.

The new branch School of Art in course of erection at the corner of Moseley Road and Lime Grove, Birmingham, was the subject of a Local Government Board inquiry into the application of the Corporation for powers to borrow £10,000 necessary for the undertaking.

UNIVERSITY OF ILLINOIS

The Architectural Association

And "Some Recent Works on Specifications."

COMMENTS ON OUR QUARTERLY PUBLICATION.*

At the meeting of the Discussion Section of the Architectural Association last Friday, Mr. H. J. Leaning in the chair, Mr. Crawford Smith opened a discussion on "Recent Works on Specifications," with special reference to the following books: "Specification" by THE BUILDERS' JOURNAL; "Specifications for Building Works, and how to write them," by F. R. Farrow (D. Fournier, Builder Office, London, 1898); "Specifications in Detail," by Frank W. Macey (E. and F. N. Spon, London, 1898). Such, at any rate, was the subject announced for the paper, but Mr. Smith explained that, owing to a little misunderstanding with the Secretary, his paper would deal rather with the subject of Specifications in general than the particular works named.

The question of specifications, he said, was of the highest importance to architects. Many were wont to ignore this practical side of their profession and concern themselves only with the beauty of the design; but it was not too much to say that an architect must stand or fall by his specification, if he wished to insure the confidence of his client and of the contractor. Specifications should be direct, succinct, and compact. Clearness should not be sacrificed to brevity; but, on the other hand, a specification should not be unduly long. Much trouble might be saved by the judicious arrangement of trades. The fundamental idea of a specification was to supply what the drawings could not show. Dimensions shown on the drawings need not be repeated in the specification. Specifications and bills of quantities should be regarded as distinct and separate. In all cases the architect should write the specification himself. He alone could fully set out the requirements of his design, and he should not leave it to the quantity surveyor.

A most important clause in regard to specifications was that samples of all materials supplied should be submitted. In specifying timber it was advisable to mention the particular brand, and insist upon having the best quality. A good piece of advice given by Laxton, which, however, few architects were likely to ignore, was this:—"Every hour's work and all material used should be charged to someone."

As to whether specimen details should be included, Mr. Smith did not consider this a good plan as a rule, though sometimes a rough sketch might be given. The only book on specification of which he had had any experience was that of Mr. Leaning. This he considered uniformly excellent, and he had found it of much practical service.

Mr. George H. Smith urged the importance of clearness and definiteness in writing specifications; the meaning should be perfectly clear, not only to the architect and his client, but to the builder's foreman; therefore every detail not shown on the plans must be put in its proper place in the specification. Reference to a text-book, he thought, was seldom desirable, on account of the great variety of modern work. The architect who had to search through all the descriptions given of any particular detail would be a very long time over his specification. Every specification might be regarded as having a skeleton—the general clauses—to be covered with flesh—the more detailed clauses.

Assuming that to be the correct view of the matter, he naturally regarded the books under discussion in the light of their compliance or otherwise with this plan. Macey's book was too bulky; it was a complete and accurate

work of reference, and the best book on its particular line, but to use it in writing a specification would tend to cramp the writer and produce an undesirable uniformity of detail.

"Specification," the publication of the BUILDERS' JOURNAL, as he understood it, aimed at being more than a guide in writing specifications; it was rather a desk book for help of all kinds. The practical notes and descriptions of materials were easily referred to, but they might with advantage be largely increased. The admission of trade advertisements in the middle of the text did not at first sight appear desirable, but if the advertisers were restricted as to space it might be distinctly useful in giving an idea of the number of manufacturers of a particular article. The constructional details given were useful, and he should like to see the number of such illustrations as that on page 120 of the current issue largely increased. But the plates given at the end of the book appeared to him to be entirely out of place, and the space they occupied might well be utilised with further practical details. The glossary of terms and extracts from the Building Acts were useful, but it was a mistake to include the items under the heading "Preparation of Bills of Quantities." It was a happy idea to have each section revised by specialists, but the general editor needed to exercise supervision to prevent the contributors contradicting each other. The information given under the headings "Legal" and "Miscellaneous" was useful, but required to be increased, and he thought it would be well if marked sizes of goods were given under another heading.

Mr. W. E. Johnson, who said that he was only conversant with Farrow's work, made a few general remarks on the subject. He agreed with what had been said as to the importance of specification writing—a matter which he was afraid was very much overlooked by architects generally. He thought it unwise to rely too much on books. Young practitioners were liable to fall into the error of following them too closely. The best plan was for the architect to take the drawings, and, after fully considering exactly what he wanted, write his specification with his drawings and details before him. It was important that the half-inch details should be drawn before the specification was written. As to Mr. Farrow's work, he thought it very useful to architects generally as a book of reference, though exception might be taken to one or two points of detail, which he proceeded to specify. The more concise and brief a specification was the better; a long wordy specification gave the builder a greater opportunity of contorting it, and using it in a wrong sense.

Mr. Max Clarke criticised one or two details in the books of Messrs. Macey and Leaning, and pointed out that they did not always agree with each other. Experienced architects were apt to forget the time when they had to learn to write specifications. Suppose, for instance, a man did not know whether a sash bead required to be $\frac{3}{16}$ in., $\frac{1}{2}$ in., or $\frac{1}{4}$ in. thick; then it was convenient to have the whole thing written down. For that reason he thought Mr. Macey's book very useful. Of course, Leaning's book was very useful to a person who knew all about such details, for, of course, few people were familiar with all kinds of building. He did not think the editor of "Specification" was to be called to order for not having sufficiently edited the various sections. He had himself pointed out the discrepancy referred to by a previous speaker, but the work was prepared in such a hurry that there was no time to edit it thoroughly; he had no doubt the next edition would be very much better.

Mr. C. H. Strange said the architect formerly began to compile his specifications on the model of his masters; they gave the general outlines, and he had but to add new items which his own works called for. During the examination of work in progress he would make marks on the margin of his specification for future guidance; thus by a slow process his knowledge increased until he considered that he had in his own mind, from

hard-earned experience, a better skeleton of a specification than any book could afford him. That was the old conservative method, but in these days of hurry it had certain disadvantages. The old system was a fairly good one if one had a good model to go upon, but it was an atrociously bad one if one had not. It perpetuated antique forms of description, "specification English," and quasi-legal expressions; it tied one down to old forms of construction and helped to close the eyes to new methods. It had the further disadvantage that one had to keep a heap of old specifications, and hunt through them when preparing a new one. The importance of having a well-written specification was now being so generally recognised that one could not wonder that publishers were attempting to supply the need.

Existing publications might be divided into three classes, Mr. Leaning's and Mr. Farrow's forming one class, Mr. Macey's another, and the publication of the BUILDERS' JOURNAL a third. In the first class the work was intended more for students, those who were learning to write specifications, and in many cases the requirements of this class were admirably suited. Mr. Macey's book was intended to meet a much larger and more important want. It set out to put at the hand of the architect examples of doing any mortal thing in connection with a building in two or more ways. This plan had undoubtedly distinct advantages. The third class of publication, that issued by the BUILDERS' JOURNAL, set out to be something more even than Mr. Macey's book. It not only proposed to give an outline specification, but it gave all sorts of detailed information, tables and illustrations thrown in. It had one very important characteristic that recommended it very much to everyone, and that was its price. No doubt it would find its way into most offices.

Of course the work was open to improvement. He thought the illustrations were a mistake altogether; they had been so reduced in the reproduction that you could not make out half of them; some of them had no scale, and he did not quite see their usefulness. Then, again, the book was made needlessly cumbersome with matter only remotely connected with the main purpose—lists of architects and builders and elaborate pictorial headings. The tables and memoranda were most appropriately included, and the glossary also, he should imagine, would be very useful. He did not believe in setting out to make a specification brief; the more pains spent on it the better it was. Neither did he agree with the suggestion that the quantity surveyor should not write the specification. He thought the quantity surveyor was the right person to do it, always provided he had an outline specification from the architect on which to base his own.

Mr. C. H. Brodie said he was extremely glad to see these books published. After writing some hundreds of specifications, he still found it most difficult to write one properly. Specifications were, as a rule, too carelessly written, the phraseology was often ridiculous, and it was seldom consistent throughout the document. Mr. Brodie recalled the fact that when he was articled, being of an enquiring mind, he asked the meaning of some of the general clauses in the specifications prepared by his firm. Nobody knew. They had been copied through the centuries that had rolled over that office, each copyist repeating the mistakes of his predecessor, and perhaps adding some on his own account, until some of the clauses had become absolutely meaningless. He noted that Mr. Macey's hand-book had an index of no less than 93 pages; that must be a great help. But it was a most dangerous thing to try and write a specification from the model clauses in these books. The architect must know what he wants and how to convey his thoughts to another mind.

The Chairman, in summing up the discussion, expressed the opinion that the scope of his father's and Mr. Farrow's books was rather limited, and that Mr. Macey's book and "Specification," the publication of THE BUILDERS' JOURNAL, really met the wants of architects more than either of the other books.

* We shall have something to say next week in reply to the comments made upon "Specification." Many of the suggested alterations and additions had already been arranged for, previous to this discussion, and as far as possible the other suggestions will be adopted.—Ed. B.J.

He thought the idea of the proprietors of "Specification" in getting several collaborators, each a specialist in his own subject, should, and as a matter of fact did, produce the best results. He understood that a good many new features were to be included in the next number, among others a list of comparative prices. That was an admirable feature; architects liked to know the relative costs of carrying out a given work in two or more ways before coming to a decision. Provided this were well done, it would, he thought, meet a great want.

A drawback to "Specification" was that it had no index; perhaps that would be added in a future issue. He agreed with previous speakers that the quantity sections were inadequate, and he thought the book would be a great deal better without them. He would suggest also that some classification of grades of work might be adopted all through the book. It would not be a bad idea, for instance, to give the kind of timber an architect might legitimately use in building where he wanted to economise, but not to put in absolute rubbish. The specimen clauses given at the end of the "Notes" in the various sections in "Specification" did not always cover the same ground as the "Notes" themselves. The idea of the publication seemed to be first of all to present the architect with all necessary information and the alternatives, and then tell him how to describe what he wanted. Mr. Lening proceeded to give several examples of things he thought should have been treated on in the work, but to which he had not found any reference; these were: stair treads, artificial stones, various kinds of plastering, ridge ventilation, and maple flooring. As to the question whether the architect should write the specification himself, Mr. Lening thought there was no objection to the quantity surveyor's writing it, but the architect must take the risk of its not being done as he wished.

KEYSTONES.

It is proposed to erect a public hall at Askam.

MR. HERKOMER'S portrait of Herbert Spencer has been lent to the Tate Gallery.

DEWSBURY TOWN COUNCIL has resolved to apply for powers to construct a local tramway.

THE monument to the late Prince Bismarck, to be erected outside the Reichstag, in Berlin, is to be 20ft. high.

A NEW school for the Bible Christians was opened last week at Tintagel. Mr. Mason, of Marshgate, was the architect.

A NEW library and reading-room, the gift of Mr. Fletcher, of Letham Grange and Fern, has been opened at Fern, near Brechin.

THE Burgh Commissioners of St. Andrews have decided to erect a memorial fountain to the late Lord Playfair, in the neighbourhood of the Golf Club.

A large infant school is about to be erected in Eldon Road, Lower Edmonton, from plans prepared by Mr. Henry W. Dobb, architect, of 110, London Wall.

THE thirty-eighth annual exhibition of the Royal Glasgow Institute of Fine Arts will open on Monday, February 6th, and close on Monday, May 8th.

A NEW POST OFFICE is to be erected in Glasgow. The site covers an area of about 3000 square yards, and the price paid is said to be £20 per square yard.

At a meeting held last week a scheme for the formation of a Literary Society and Institute for Gateshead was prepared, and it is proposed to erect a new building in place of the one already owned by the Mechanics' Institute. At the meeting plans by Messrs. Armstrong and Knowles were exhibited.

SEVERAL additions and improvements have been made in the Church of St. Mark's, Kennington. A pulpit formerly in St. Michael's, Wood Street, and a new lectern have been presented, the font has been removed to the west end, and various renovations and decorations are in contemplation.

ON the 10th inst., prizes were distributed to the students of the Plymouth School of Art, which has had a most successful year.

A COMMITTEE has been appointed to consider whether the old church in the Preston suburb of Brighton shall be enlarged or a new one erected.

THE EARL OF DERBY and Mr. T. Sutton Timmis, of St. Helens, have each given a donation of £1000 to the building fund of the Liverpool Church House.

At a recent meeting of the Louth Town Council it was decided to obtain information from the Louth Water Company with a view of purchasing the under-taking.

EXTENSIVE improvements, chiefly in regard to street paving and surface drainage, are proposed to be carried out at Clifton. The cost is expected to amount to £6800.

THE Royal Nursing Home at Romsey, Isle of Wight, erected to commemorate the Diamond Jubilee of Her Majesty, was opened by Princess Henry of Battenberg on the 11th.

THE restoration of Holy Trinity Church, Hull, will shortly be put in hand. The work is estimated to cost upwards of £4000. The greater part of this amount has now been collected.

THE Great Northern Railway contemplate making extensive alterations and improvements at Grantham, by widening bridges, &c., and have petitioned Parliament to sanction the work.

THE late Rev. George Proctor, schoolmaster, Kemnay, has bequeathed the residue of his estate, amounting to about £3000, to the University of Aberdeen towards the founding of an astronomical observatory at King's College.

THE new parish institute erected at Cockington has been opened. The building comprises a small chapel, a large assembly room, with gallery and class-rooms, &c. The cost has been about £900, and it has been erected by Mr. Phare from plans by Messrs. Rowell and Son.

PLANS of blocks of houses for four tenants, to be erected in Wellington Place, opposite North Links School, by Mr. A. Brown, builder; a new tun room at Lochside Brewery; and the alteration and improvement of the police stables, have been agreed to for erection at Montrose.

AT Lincoln Cathedral, the new organ is now being blown by electric energy. Three motors, of $\frac{3}{4}$, 1, and 3 horse-power, each of which is controlled by a separate switch, operated by the organist, are placed in the triforium. At the first trial of the apparatus it worked extremely well.

THE ARCHBISHOP OF YORK has allotted from the Marriott Bequest Fund £1500 towards the cost of erecting a permanent church in North Newington, Hull, subject to a similar amount being raised within three years. A scheme has been set on foot for collecting the remainder of the money locally.

It is proposed to raise a fund for the restoration of St. David's Cathedral. The restoration of the beautiful Eastern buildings, which will cost, it is estimated, not less than £12,000, is intended as a memorial to the late Dr. Basil Jones and Deans Allen and Phillips, whose names are closely associated with the Cathedral and the diocese.

THE memorial to Lord Tennyson in Haslemere Church is to take the form of a window, after a design by the late Sir Edward Burne-Jones; it is one of the last of a series illustrating the story of the Holy Grail, and represents the vision which came to Sir Galahad in the little chapel. The window will cost about £100.

At a meeting of the Sheffield City Council on January 11th, the minutes of the Electric Light Committee were presented. It appeared that during the past twelve months, while the old company worked the undertaking on behalf of the Corporation, the gross revenue was £17,104 15s. 4d., against £14,823 10s. in the previous year, although the price of current was in March last reduced from 5d. to 4d., and after paying, as agreed, £10,837 interest to the shareholders and debentureholders, there would be not less than £3000 clear profit for the Corporation on revenue account as a result of the last year's working.

YORK CITY COUNCIL has rescinded a resolution passed last October in favour of the erection of a public slaughter house.

THE Paisley Town Council have under consideration a proposal to carry out extension of the gas works, embracing new retort house with bench of eighty retorts, enlargement of existing condenser, one pair of Beals rotary exhausters, exhauster and pump houses, tar pump, and new station meter, estimated to cost in all £9238.

At the Lancashire College Settlement last Tuesday week Mr. F. Brocklehurst gave a lecture on "Machinery and Labour;" the object of the discourse was to inquire into the effects of machinery upon the working classes as producers, and into the results of the improvement of machinery upon the individual as a unit, and upon society as a collection of units.

THE new vestry at the Church of St. Anne's, Eastbourne, has just been dedicated. The new building consists of a spacious room with a crypt underneath for the storage of seats, &c., the cost of which has been about £500. This, however, is but one of the additions to the church, and it is hoped ere long a tower will be erected in order to complete it. The architect is Mr. Merry.

THE new infants' block at the Cardiff Workhouse has just been opened. The building was erected by Mr. Joseph Thomas, to the designs of Mr. Seward, and Mr. Scott has carried out the duties of clerk of works. Messrs. John Williams and Sons have fitted up the hot water and heating arrangements, and the contractor was Mr. Thomas. The whole cost of the building is £1870.

THE estimated cost of the improvements to be effected by the London County Council under their Bill recently deposited in Parliament amounts to more than five and a-half millions sterling. The main item in the proposed improvements is the construction of the new street from Holborn to the Strand, the estimate for this, including the purchase of the necessary property, is £4,862,500.

AN altar panel in the beautiful material known as "Pictus Sertus" representing the Saviour as the Good Shepherd, and the Four Evangelists, has just been erected in St. Alban's Church, Leeds, as a memorial to one of the late curates. The artists are Messrs. Kayl and Co., Albion Street, Leeds, who are also the patentees of this new material for wall decoration.

AN address to the members of the Liverpool Chamber of Commerce is to be delivered shortly on the subject of a proposed express electric railway, by Mr. F. B. Bahr, A.M.I.C.E., of London. The line will consist of a single rail, supported on trestles. On the rail will run cars, each containing their own motors. It is proposed that a speed exceeding 100 miles an hour shall be attained.

THE West Riding Technical Instruction Committee are proposing to offer scholarships, free studentships, and exhibitions during the year ending March 31, 1900, in conformity with a scheme prepared, and to renew scholarships, free studentships, and exhibitions granted during previous years as they might think expedient, at an estimated cost, including examinations and other incidental expenses, of £10,500.

LAST week a portion of an iron bridge leading from Crewe Station to the railway works collapsed and fell on to the main Chester line, which runs underneath. Over 20ft. of the span fell, and the permanent way was much damaged, causing delay to trains. The large iron pillars supporting the structure appear to have given way first, probably owing to excavations caused by tunnelling underneath.

WAKEFIELD CATHEDRAL is to be enlarged as a memorial to the late Dr. Walsham How, the first Bishop of the diocese. It is expected that the total cost of carrying out the entire scheme of the late Mr. Pearson will be between £25,000 and £30,000. The Bishop has just received an anonymous donation of £3000, making £11,000 promised towards the first section of the work, the estimated cost of which is £14,700, and which will be put in hand at once.

VICTORIA STATION is to be considerably enlarged. The present building is quite inadequate for the present traffic; in fact, when it was opened in 1860 it was regarded by the railway officials as merely a temporary structure. The improvements are expected to cost nearly £1,500,000.

At a meeting of the Smethwick District Council on the 10th, Mr. H. Mitchell, head of the brewery firm of H. Mitchell and Co., presented a drill hall and recreation ground, including cricket and football enclosures, to the town of Smethwick. The gifts are estimated to be worth close upon £10,000.

We are informed that Mr. J. D. Burton, architect and surveyor, has removed from 2, Guide Lane, Hooley Hill, to 150a, Stamford Street, Ashton-under-Lyne. He has taken into partnership Mr. J. A. Percival, who for the past fourteen years has been his manager and draughtsman; and the style of the firm will in future be:—J. N. Burton and J. A. Percival, architects and surveyors, 150a, Stamford Street, Ashton-under-Lyne.

The chancel of Addington Church will be reopened and dedicated on Friday evening, the 20th inst., as a memorial to the late Archbishop Benson. The work of restoration consists in the reopening of a Saxon window which had been blocked, probably, for six centuries; and the construction of a hexagonal oak ceiling on the underside of the ancient thirteenth century roof timbers in place of the lath-and-plaster ceiling, which some same period had been substituted for the original boarding.

By the will of the late Mr. Paul Lutz, the Wolverhampton Corporation becomes possessed of thirty-one oil paintings, by Sir Edwin Landseer, R.A.; George Morland; P. F. Poole, R.A.; W. Collins, R.A.; C. Creswick, R.A.; W. Muller; G. T. Webster, R.A.; F. Goodall, R.A.; Sidney Cooper, R.A.; Mark Antony; Edward Frere; E. M. Cooke, R.A.; David Cox, Sen.; Erskine Nicol, A.R.A.; G. Arnold, R.A.; H. O'Neil, R.A., and others. They will be hung in the Art Gallery.

At the monthly meeting of the Mablethorpe Urban District Council held on the 11th inst., it was resolved to make a promenade walk over the top of the basin head facing the sea. It will be about 130yds. in length, and 12ft. wide. Seats will be placed at frequent intervals. The contract for the proposed new street, called Waterloo Street, which leads out of High Street on the west side and runs parallel with the railway, has been secured by Messrs. Mawer and Mellor, contractors, of Louth.

PERMISSION has been granted by the Dean of Guild Court, Edinburgh, for the following new works which are to be carried out in that city:—To William Little and Sons, for new workshop at 77, Pitt Street; trustees of Old Church, to erect hall at St. John Street; Robert Younger, Limited, for alterations at St. Ann's Brewery; Wm. Younger and Co. Limited, for additions to Holyrood Brewery; A. A. Vumbers, for workshop at Mayfield Road; Redpath, Brown and Co. Limited, for additions to works at Easter Road.

AN exceptionally sumptuous copy of Ptolemy's "Cosmographia," printed at Rome in 1490, and illuminated for the family of Frescobaldi of Florence, has just been added to the beautiful and interesting examples of the bindings of printed books exhibited in the King's Library in the British Museum. It is as a specimen of the richest French binding that the volume is particularly noteworthy. The work is stated to have been executed by Nicholas Eve, a noted binder, for Mary, Queen of Scots. Its value cannot be less than £700.

AN extensive and up-to-date Infirmary and Steam Laundry has been provided in connection with the Workhouse at Wakefield. The buildings, which have entailed an outlay of nearly £40,000, are to be opened to-morrow. They have been designed and carried out by Mr. W. Watson, of Wakefield. The Infirmary will accommodate 150 patients, a resident medical officer, lady superintendent, nursing staff, and servants. The laundry buildings comprise an extensive block, situate near the eastern boundary of the site. It is over 200ft. long by 45ft. wide.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

January 18th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

LONDONERS have been wont to accept London fogs as a dispensation of Providence, to be endured rather than to be cured. Now, however, a little band of reformers, amongst whom are Sir W. B. Richmond and other eminent artists, are trying to teach them to regard smoke and fog as evils from which they may, if they will, escape. At a public meeting, held at St. Mark's School, Marylebone, the Rev. Morris Fuller, who presided, said that

rest upon substantial data, it would probably move the average Londoner a good deal more than Mr. Moschelles' sad story of the lemon coloured mermaid.

WE wish the crusaders against the smoke fiend all possible success, for the crusade is one against ugliness, disease, and death, and as such deserves the sympathy and help of all. It is worth while, however, to note that local authorities already have considerable powers in the matter, and in some cases they enforce them. Within the past few days fines have been imposed upon the proprietor of Niagara Hall, Westminster, and upon Messrs. Burroughes and Watts, the billiard table manufacturers, for allowing black smoke to issue from their chimneys, while a similar summons against the Army and Navy Co-operative Stores has been adjourned for a month to give the defendants time to abate the nuisance. If all London vestries were as vigilant in the matter as the Westminster Vestry appears to be, much good might be done. Meanwhile, would not the vendors of "smokeless" coal, be well advised at this juncture to make their existence more generally known?

THE redecoration of the Colonial Office, which is now in progress, has suggested to "F. C. G." of the Westminster Gazette, the amusing design for a frieze, which is here reproduced. The drawing is accompanied by the following explanation:—"Mr. Chamberlain's rooms in the Colonial Office are being

A COLONIAL OFFICE FRIEZE. BY "F. C. G." FROM "THE WESTMINSTER GAZETTE."

the atmosphere of London might be as pure as that of New York or Paris. In those cities the law against fouling the air with thick, black smoke was enforced. In Paris watchmen were placed on the Eiffel Tower to see that no one infringed the law. He suggested that the Monument in London might be applied to the same purpose, and that two or three watchmen might spend the day there on the lookout for offenders. He also suggested that if people generally would use anthracite coal in their grates, much would be done to mitigate the nuisance.

MR. FELIX MOSCHELLES spoke of the annoyance and inconvenience caused to artists by the constant murkiness of our atmosphere. He told how once, when painting his picture of "The Mermaid and Fisherman," a fog came on. A peculiar light was thrown upon his model, and he essayed to catch its reflection, and transfer it to his canvas. On his palette he had some white paint and some lemon yellow. In the uncertain light he used the wrong colour, with the result that his heroine appeared all in lemon colour, and his picture was spoilt. Dr. George Wyld moved a resolution calling upon the London County Council to combat the nuisance by promoting legislation on the subject. He stated that the destructiveness of London smoke was such that it depreciated property to the extent of two millions sterling per annum. Such a statement must, we imagine, be very much of the nature of a guess, but if it could be shown to

redecoration. We would suggest that the above design for the frieze in the Colonial Secretary's sanctum would be distinctly appropriate. The general style is Renaissance, and the principal recurring theme in the ornament is a boar-like chimera bearing a resemblance to President Kruger. In the volutes of the tail are entangled birds representing Dr. Jameson, Sir John Willoughby, and Colonel Rhodes. The apples recall the historic cart which was upset. Next come symbolic references to the varying relations existing between Mr. Rhodes and Mr. Chamberlain, at first friendly, but afterwards interrupted by a very pretty kettle of fish. The lower portion of this ornament represents Brer Fox getting away (Mr. Labouchere plucking at his tail) partially under cover of Sir Richard Webster, who typifies 'correctitude.' The next portion of the frieze shows Mr. Chamberlain with two long spoons stirring and screwing up the sleeping figure of Lord Salisbury, who is evidently unconscious of the stealthy approach of bears and the crowing of aggressive cocks. Below the frieze is an appropriate Ego and tongue moulding. We are quite sure that Mr. Chamberlain, in his leisure moments and whilst smoking the recuperative and soothing cigar, would find pleasure in looking round the walls of his room, and recalling memories of happy events." We have no doubt all our readers, whatever their political views, will appreciate the humour of a skit which is, we think, one of the gifted caricaturist's happiest inspirations.

AMONG provincial Art schools, few have a more satisfactory record than the Brighton Municipal School of Art, which has just held an exhibition of the works of its students. During the past year, 478 works were submitted to the Science and Art Department for examination, of which about 40 were selected for the national competition between all the schools in the kingdom, with the result that four medals and ten other prizes were awarded to the Brighton School of Art; and also one Royal Exhibition of the value of £60 per year for three years, tenable at the Royal College of Art, South Kensington. For the Science and Art Department examinations last year, 523 papers were worked, the result being that 197 were awarded first class and 199 second class. In special distinctions nine students obtained the mark "excellent" in the three subjects in which the award was made; one student a first and one a second-class in Honours Design; and three students gained Queen's prizes.

A STATEMENT made by the Mayor of Brighton at the opening of the Exhibition, as to the status of the students attending the Art School, affords highly satisfactory evidence of the extent to which a taste for art studies—at any rate, in Brighton—is being diffused amongst all classes of the community. The total number of students in attendance is at present 355. Of these 19 per cent. are mechanics, 27 per cent. shopkeepers, 3 per cent. servants, 14 per cent. teachers, and 11 per cent. clerks. The cultivation of the æsthetic sense amongst people not professionally engaged in artistic occupations must make for the advancement of art, as well as for the moral and intellectual progress of the

community. It were well if every town had an art school thus engaged.

THERE is, perhaps, no district in the City which has seen so many improvements in the matter of the erection of business premises as the neighbourhood of Wood Street and Aldermanbury. One of the improvements is the further extension of the premises of Bradbury, Greatorex, and Co. Limited. The latest addition to the firm's establishments comprises Nos. 10 and 11 in Dyer's Court. On this site roomy premises of three floors have been set up, according to the designs of Mr. Howard Chatfield Clarke, of 63, Bishopsgate Street. The new warehouse is replete with every convenience for facilitating the carrying out of orders, and has a floor area of over 11,000 square feet. The doorway is illustrated below.

At the annual exhibition of the Hammer-smith School of Art, Sir William Richmond, R.A., said that he entertained great hopes of the study and practice of the decorative arts in England rising to even greater eminence than had been the case in the past. All, however, depended upon whether the general public wanted better work or not. Certainly there had been deterioration, but he believed that a reaction was now setting in, and this was probably because it was found absolutely necessary for English goods to be of the best possible quality. The tendency in recent years with regard to Art seemed to have been too theoretical, but if art in its highest sense was to come back to England and shine as it once did, much more attention would have to be given to practical training. Doubtless it would be a long time before we reached the high ideal which many desired to see realised.

He urged those present to support the Vestry in the endeavour to establish a much larger Art school and technical institute in Hammer-smith.

THE extensive alterations and improvements that are being made in the market accommodation at Leeds are approaching completion, and the town will very shortly possess one of the finest sets of markets in the Kingdom. The process of demolishing the retail fish market is to be begun immediately, and the cleared space will be spanned by a roof and added to the vegetable market. It is an ugly building, and has the effect of lessening the light and ventilation. Up-to-date shops will in the course of a few months rise, and, pending their completion, the dispossessed fish salesmen will be found temporary accommodation by the authorities. Good progress is being made with the new wholesale dead meat market and abattoirs in York Street, which will be let to tradesmen at present occupying shops in the Shambles. But the most important of the projects in hand is undoubtedly the scheme for building a new Market Hall. The city engineer, Mr. Hewson, has been instructed to prepare a ground plan, and when this is completed architects will be invited to submit competitive designs. Any definite decision on the part of the Committee will, of course, be postponed until these drawings have been sent in, but the idea seems to be in favour of erecting a building which, externally at least, shall be more artistic and beautiful than the existing old-fashioned structure. The new Market Hall will have important frontages to Vicar Lane, Kirkgate, and the new street running from Briggate, through the Shambles, to George Street. There will be no galleries, as in the present building, the intention being to utilise only the ground floor for shops and stalls. The roof will be of glass, formed in bays.

MISS MARGARET BENSON and Miss Janet Gourlay have spent three seasons in examinations and excavations at Karnak, the site of the Temple of Mut, in Asher, and, having made interesting discoveries, they were brought to consider the desirability of publishing a book on the subject. This volume Mr. Murray will shortly have ready. Mr. Percy Newberry is responsible for the inscriptions and translations, and Mr. E. F. Benson has given considerable assistance to his sister and her collaborator in the preparation of maps and plans.

BIRMINGHAM, which is rich in the possession of works from the brush of the late Sir Edward Burne-Jones, will at some distant date receive a valuable addition to its treasures. At a meeting of the City Council last Tuesday week the Lord Mayor read a letter from Lady Burne-Jones giving the Council official intimation of her intention to bequeath to the Art Gallery at her death the portrait of her husband, painted by Mr. G. F. Watts. On the Lord Mayor's proposition the Council expressed their pleasure at such a gift, and heartily agreed to the condition that the portrait should be placed among Sir Edward Burne-Jones's own pictures. At the same time they expressed the hope that the date when the picture would come into the possession of the city was far distant.

THE mausoleum at Friedrichsruhe, which will shortly receive the remains of the late Prince Bismarck, is a building of modest dimensions, and without any imposing architectural attributes. The architect has tried to realise the restfulness of some out-of-the-way country church, and he has completely succeeded. The mausoleum, which stands on a hill near the late Prince's home, called the Schneckenberg, is approached by a winding path. It consists simply of a round tower and a short nave. The graves of the Prince and Princess are situated in the tower, while the remainder of the building is reserved for the general family vault. The style of the whole building is simple in the extreme.

DOORWAY, 10 AND 11, DYER'S COURT, E.C. HOWARD CHATFIELD CLARKE, ARCHITECT.

ACCORDING to a writer in the Church Gazette there are in England only four great altar screens. They are the cathedrals of Winchester and St. Albans, and the churches of St. Saviour, Southwark, and Christchurch, Hampshire. These four screens have several features in common. They are of about the same date, and, consequently, in the same style. They all provide a central altar space, flanked by a couple of doors. Each occupies the whole width of the sanctuary, and rises from the floor to the level of the clerestory, and each screens off a chapel. Each, too, adorns a church that was once monastic.

THE programme of the next session (the forty-first) of the Society for the Encouragement of the Fine Arts is before us, and a capital programme it is. The session opens to-morrow evening, January 19th, when Mr. J. S. Shedlock is to deliver a lecture, with musical illustrations, on Chopin's works. Among subsequent arrangements may be mentioned: "The Sacred Lake of the Incas," by Mr. John Wilson; "The Elements of Design in Painting," by Mr. T. R. Spence; "Some Goldsmiths and their Work," by Mrs. Philip H. Newman; "The Growth of Art in our Public Schools," by Mr. Robert Cameron, M.P. The Hon. Secretary of the Society is Mr. Philip H. Newman, R.B.A., 21, Endsleigh Gardens, London, N.W.

THE question of building a new town hall for Cardiff has aroused considerable discussion. At the last meeting of the Cardiff County Council a proposal was made that the matter should be deferred until various other improvements connected with drainage, tramways, and refuse destruction, were either completed or in working order. The proposal was defeated by a large majority. It is likely, therefore, that Cardiff will have its town hall, though not immediately. It was stated by one of the speakers that it would take at least nine months before the plans were ready, and that it would be six years before they could hope to have the building quite finished.

THE report issued by the Board of Trade on boiler explosions during the year ending June 30th, 1898, shows that 84 explosions were investigated, 46 of which occurred on board ship and 38 on land. By these explosions, 37 persons were killed and 46 injured. It is noteworthy that nearly all these accidents were caused by bad workmanship on the part of the makers of the boilers or the attendants. Thirty-four are stated to be due to the defective condition of the boiler or its fittings, 27 to defects in the design, workmanship, material or construction, or to undue working pressure, and 14 to ignorance or neglect on the part of the attendants.

EFFORTS are being made by various electrical companies to obtain the exclusive rights of supplying electrical power over large areas in various populous parts of the country. Thus, the General Power Distributing Company have a Bill before Parliament which, if passed, will give them a monopoly over a district of 2000 square miles in area, which includes such important towns as Sheffield, Doncaster, Nottingham, and Derby. Two other Bills aim at giving similar rights to companies operating in Lancashire and Cheshire. In South London the Brush Company is seeking powers for the supply of electrical energy over an area of about 10,000 acres, which includes Lambeth, Lewisham, Rotherhithe, Deptford, and Greenwich.

THESE schemes have aroused considerable opposition in many quarters. At a conference of the municipal authorities of Lancashire and Cheshire, presided over by the Lord Mayor of Manchester, it was resolved that united action should be taken in opposition to the Lancashire Electric Power Company's Bill and the South Lancashire and Cheshire Electric Power Bill. The chief grounds of opposition seem to be that the Bills, if passed, would have the effect of depriving municipalities of the capital invested in electric lighting undertakings, and that they violate the broad principle

DESIGN FOR HALL FIREPLACE. BY DAVID JOHN ROBERTS.

that municipal authorities should be allowed to control the lighting and other services in the interests of the ratepayers, unhampered by private competition.

At the annual general meeting of the Society of Miniature Painters, Sir William B. Richmond, R.A., was elected President, Messrs. Alyn Williams and Hal Hurst, Vice-Presidents, Mr. Edward Tayler, Hon. Treasurer, Mr. Cecil W. Quinell, Hon. Secretary, and Mrs. Behenna, Mr. and Mrs. Lee Hankey, Messrs. Heath, Hobson, Jackson, Nicholson, and Robertson, Members of the Council. The private view of the fourth annual Exhibition took place at the Modern Gallery, 175, Bond Street, yesterday, and the Exhibition is open to the public to-day.

THE artistic design given above for a hall fireplace was awarded the first premium at the Royal Welsh National Eisteddfod for 1897, held at Newport, South Wales. The author is Mr. David John Roberts, of Bangor, North Wales. The assessor was Mr. A. Beresford Pite, F.R.I.B.A.

A SOMEWHAT curious discussion has been going on in reference to the building of a new church for the congregation of St. Bartholomew's, Nottingham. The building committee decided that they would like the church to be built of rock-faced stone. The late Mr. J. L. Pearson drew the plans for them, and the committee asked his son, Mr. F. L. Pearson, to carry them out, but the latter has a very strong objection to rock-faced stone, which he considers is wanting in dignity. The committee, therefore, decided to build the church in brick, which would also be cheaper. The congregation generally, however, having set their minds on a stone church, declined to endorse this decision. It has now been decided to see whether the architect's scruples against rock-faced stone can be overcome.

THE Bishop of Salisbury, in his New Year Pastoral, deprecates the indulgence of taste or pride in lavishing money on church buildings and neglecting more pressing needs; this he describes as religious selfishness. He thinks that each diocese may claim to have a magnificent cathedral, and that no one would grudge expenditure on our ancient abbeys and notable shrines, but he does not see why every parish church should be magnificent. Commenting on these remarks the Morning Post observes that there has been, no doubt, a tendency in large towns to build parish churches on too big a scale, and to adorn them somewhat profusely, for which excellent reasons have been adduced. That state of things scarcely affects a rural diocese like that of Salisbury, and probably the majority of the Bishop's clergy have been only too thankful to be able to rescue their churches from decay and ruin without dreaming of imparting magnificence. Dr. Wordsworth would surely not intend to condemn the munificent devotion

which prompted the erection of the splendid temples at Wilton, in his own diocese, at Hoar Cross, at Stretton, or at Sledmere.

THE Pastel Society will hold its first exhibition at the beginning of February in the galleries of the Royal Institute of Painters, Piccadilly. Among the members who intend to contribute to the exhibition are Messrs. Swan, Boughton, Watts, Crane, Stott, Clausen, Brabazon, Priestman, Murhman, and Onslow Ford; and among the foreign artists are MM. Carriere, Besnard, Thaulow, Khnopff, Gandara, Lenbach Segantini, Wauters, and others. Mr. S. Melton Fisher is honorary treasurer, and Miss Marion Gemmell, honorary secretary.

SOME remarkable discoveries have lately been made at Rome. Some workmen engaged in making excavations in the Forum came across the column raised by the Emperor Augustus to the memory of Julius Caesar. Close by was a large slab of stone where the body of Caesar was burned. On top of this slab it is believed by Roman antiquarians that the Senate erected a votive column to Caesar's memory. Close to the head of the slab—so says the Daily Mail—the ashes of Julius Caesar were found in an urn. A column and some fragments and inscriptions of the ancient Temple of Vesta have also been found together with a handsome statue of Minerva, which according to the ancient histories had been transported from Troy to Rome by Aeneas. Another wonderful discovery is said to have been made in the Forum. To the east of the Rostra Julia, about the middle of the Forum, was found the celebrated Niger Lapis, the black stone marking the spot so famous in the legends surrounding the earliest history of the Eternal City, where Romulus was buried, or rather where he would have been buried had he not disappointed expectations by becoming a god and being translated to a happier sphere. Perhaps an attitude of philosophic doubt is pardonable with respect to the details of these discoveries.

THE church at Henley-in-Arden is in need of restoration, and the Vicar is appealing for funds. The church is not without interesting architectural features. From the architect's report it appears that this church bears evidence that the chancel, nave, and tower are of the period of Edward III., and that it is apparent that the north aisle was added subsequently, and possibly not of the width originally intended. The church bears unmistakable evidence of having been built by the same masons as those who worked at Wootton Wawen, at Lapworth, and other churches in the neighbourhood. In respect of the comparative thinness of the main walls, it stands alone among the churches of the district, and it would appear that the walls are solid, and of squared stones throughout, and not, as is usual in mediæval

work, built with an inner and outer face of worked stone, and a core of rubble. It is proposed to effect the restoration in a careful and conservative manner with a view to arresting decay. The cost is estimated at £640.

At a meeting held on Thursday at the rooms of the Institute of Civil Engineers, Professor Sylvanus Thompson presiding, the following awards of premiums for papers read during the session 1897-8 were made: The Institute Premium, Mr. Horace F. Parshall; the Paris Electrical Exhibition Premium, Mr. Robert Hammond; Extra Premium, Mr. Leonard Andrews; Premium for Original Communications, Mr. H. N. Allen; Students' Premiums, Mr. J. M. Donaldson, Mr. Morris Solomon, Mr. E. E. Tasker. Sir David Solomon Scholarships were awarded to Mr. T. R. Renfree, King's College, London, and Mr. H. J. Tomlinson, University College, London.

At the annual prize distribution and students' soirée in connection with the Clapham Art School on Thursday, the prizes were presented by Mr. T. McKinnon Wood, the Chairman of the London County Council. In his address to the students, Mr. Wood said that the art of Architecture was the one that had perhaps most relation to municipal functions. In London there were many fine buildings, also elsewhere, but the grand difficulty was that they had no room to see them. He was glad to see the Government had at last commenced the great improvement in Parliament Street, and they would have a finer view of the Abbey than ever before, and he hoped the architect would make appropriate use of this almost unique opportunity. But the County Council also had a proposal coming before Parliament for cutting a magnificent thoroughfare from Holborn to the Strand, 100ft. in width, which would provide great opportunities for the architects of the future. For he trusted the Council would keep in their own control the architectural development of the thoroughfare, and not repeat the mistakes of the past, but have a street architecturally worthy of the metropolis of the Empire. Continuing, he said he did not know why they should not have a school for modelling smaller works in such metal as bronze. Also in the case of the precious metals it was evident that the jeweller depended wholly in his work on the intrinsic beauty of the metals and precious stones he used. Silver work consisted in the mere repetition of old designs, and there was absolutely no original work. The prizes were afterwards distributed, Rose D. Bonnor receiving the bronze medal of the Science and Art department, and the national book prizes being carried off by E. Dunkley, M. Haghe, and B. Händler. In the eleven national competitions in which the school has taken part, it has now been awarded four gold, six silver, and seven bronze medals.

MR. HOLMAN HUNT has finished his new picture, "The Miracle of the Sacred Fire." It is the result of nearly five years' continuous labour; for he began it at Jerusalem in 1893, and it has been the subject of patient and at the same time wonderfully brilliant and sustained work ever since. For sheer power and energy of artistry it represents, perhaps, the great achievement of Mr. Holman Hunt's life. The subject is the curious ceremony which brings together Greek Christians from all parts of Eastern Europe and Asia on the Eve of the Greek Easter to the Church of the Holy Sepulchre in Jerusalem. The scene, which is one of singular animation and vividness, represents the moment when the "sacred fire" is miraculously kindled, or supposed to be kindled, within the Sepulchre, and the flame is being handed out to a shouting congregation of enthusiasts, who throng the pavement of the church and catch the flame on hundreds of torches and tapers. The canvas contains more than 400 figures, and it glows with the colour reflected from an astonishing assemblage of Oriental costumes, many of which are now disappearing, so that the picture should possess a very real historic value.

Professional Items.

ABERFOYLE.—A stained-glass window to the memory of the late Mrs. Dalziel, of Tigh-na-Traigh, has been placed in Aberfoyle Parish Church. It consists of three compartments, which are filled with figures illustrating the Nativity. Messrs. A. Ballantine and Gardiner, of Edinburgh, are the artists of the work.

BEMWELL.—A new Baptist chapel and hall are being erected at Bemwell, Newcastle-on-Tyne. The whole scheme consists of church, with nave, aisles, and transepts, having side and end galleries, and seated for 750. The choir and baptistry are placed behind the pulpit, with organ-chamber on one side and minister's and deacons' vestry adjoining, the hall being beyond. The hall is now completed, and has just been opened. It is seated for 250, with two class-rooms on the same floor, and in the basement there are infant's class-room for 100, class-room or tea-room for 50, and heating chamber, &c. The ventilation is by Sherringham inlets and Cousland and Mackay's concealed roof extract ventilators, and the heating is by low pressure, hot water. Mr. N. W. Maughan is the contractor, and Messrs. Emley and Sons are the heating engineers. The Gateshead Stained Glass Company Limited have supplied the lead glazing. The architects are Messrs. Badenoch and Bruce.

CARDIFF.—A new English Congregational chapel has been opened in Cowbridge Road. The chapel is in the fifteenth century perpendicular style of Gothic Architecture. The materials used are Newbridge stone facing with Corsham Down stone dressings, and the roof is covered with green slates. The carved gable finials, &c., are by Mr. Wormleighton, of Cardiff. Internally, the dimensions are 73ft. by 48ft. 6in. The seats give accommodation for 474 adults, whilst in addition a choir of about 50 can be accommodated on the platform. Galleries, when desirable, can be added, and further accommodation for 362 persons provided. The building is well lighted, the lead lights being by Mr. T. Evans, West Smethwick; the electric lighting has been carried out by Messrs. Clay Brothers, Cardiff; the heating by Messrs. Baker, Newport; and the general contractor was Mr. W. T. Morgan, of Cardiff, who has done his work excellently, the contract price being about £2600. Messrs. Veall and Sant were the architects.

CRINGLEFORD.—Cringleford Church has been restored and enlarged at a cost of over £1400. The restorations effected may be thus stated: The south wall of the nave has been removed, and in its place there is an arcade of three arches on four stone columns; an aisle with gable roof, capable of seating over 100 people, has been built; the decayed roof of the nave has been replaced by an open timber roof of pitch pine; the nave and aisle have been seated with oak; two buttresses have been built into the north wall; a new heating chamber has been built, and heating apparatus fitted throughout the church and chancel by Messrs. Reeve, of Duke Street; the tower and porch have been restored. In the course of all this work some interesting antiquarian discoveries have been made. While the north wall was being unflaked traces were found of two early arches, with a Saxon window splayed on both sides, and retaining some of its old oak frame. In the south wall were found portions of Saxon crosses and a small Norman capital of early date. A double recess inside the north wall and a squint on its outside have also been discovered. Mr. A. J. Lacey, diocesan surveyor, prepared the scheme for the work, which has been carried out by Messrs. G. E. Hawes and Sons.

GLASGOW.—Permission has been granted by the Glasgow Dean of Guild Court to the following:—Alexander Eadie, builder, Cathcart Road, to erect tenements of dwelling-houses

in Keir Street, Pollockshields; James Ferguson, builder, to erect three tenements of shops and dwelling-houses in Hyndland Road; the School Board of Glasgow, to add to the school in John Street, Bridgeton; the Anniesland Co-operative Society, to erect buildings in Anniesland; the United Co-operative Baking Society, to alter and add to their premises in M'Neil Street; Robertson and Baxter, wine and spirit brokers, to erect buildings in West Nile Street; William R. Aitken, builder, to form a street from Canal Street to James Street; and William Waddell, builder, to erect tenements in Langside.

HARROGATE.—The Crown Hotel, Harrogate, is undergoing extensive alterations and additions, under the direction of Mr. W. J. Morley, F.R.I.B.A., architect. The exterior of the new block, which will face the Royal Baths in Montpelier Road, will be a handsome structure of stone, having a lofty tower at the angle joining up to the present building and an ornamental gable, the whole forming an imposing pile, worthy of its important and prominent position. The building is to be warmed throughout by hot water radiators, &c.; fire appliances will be provided on each floor, and fire escapes at different points. The drainage is to be entirely new, and is to be on the most approved system and thoroughly ventilated, the pipes all having patent joints. All the rooms throughout will be handsomely decorated, and lighted with the electric light.

LEEDS.—It is proposed to erect a new Presbyterian Church and school hall at Leeds. The hall has just been built. The architect, Mr. W. H. Beevers, A.R.I.B.A., has so planned the two structures that they will be an added ornament to the locality. The hall, which has cost £1800, is built of pitch-faced stone lined with brick, with a pointed red-tiled roof. The church is to be in the Old English style of Architecture, with a handsome tower and spire at the junction of the two roads. It will be about 67ft. long by 37ft. wide, and there will be seats for about 500 people. The carrying out of the whole scheme will cost about £7000.

MANCHESTER.—The new laboratory, of which the foundation stone has been laid on the twenty-fifth anniversary of the occupation of the present Owens College buildings, will be the largest and most completely equipped in this country. It stands on a separate plot of ground adjoining the Owens College site, and consists of a main building and a large annexe, the latter being more especially intended for electro-technical work. The principal building is 100ft. long and over 60ft. wide, and consists of a basement and three stories. The cost of the building, with fittings and new apparatus is estimated at £30,000. It is intended to have at least one room set aside for constant temperature work, and to establish a small plant for the production of low temperatures. An electro-technical laboratory will be added, in which large currents will be available for electric furnaces. One of the features of the laboratory will be a carefully-planned system of ventilation, combined with an attempt to exclude dust as far as possible from all rooms, and especially from the instrument cases. The Plenum system had to be rejected because it takes up too much valuable basement space, because it is ineffective as regards exclusion of dust, and because the inevitable noise and mechanical shaking due to the fans would have seriously interfered with the work of the laboratory. The architect is Mr. J. W. Beaumont, who, before finally drawing the plans, was sent by the Council of Owens College to visit the principal modern laboratories of Germany.

PETERBOROUGH.—During the past week the south gable of the great west front of Peterborough Cathedral has been in the hands of the restorers, and the next step will be the removal of the heavy finial. This gable is not so much out of the perpendicular, nor is it in such a frightful plight as that which marked the degeneration of its northern sister. It is

aning towards the market-place about ft. 11in.; while the other was over 2ft. 2in. ut of plumb. The arch mouldings are ecore and will not be touched, the work nly proceeding to the main string course ust below the base of the gable. There are ome nasty cracks in the upper masonry, but hey are trivial compared with the chasms hich were in the north gable. The work is ill being done by Messrs. Thompson's firm, nder the conservative treatment of Mr. G. F. odney, A.R.A., the Restoration Committee's rehitect. The weather and iron clamps have layed havoc with the statuary in this par- ular gable, although on the whole they ompare well with the attenuated colony iscovered in the north niches. All the saints a their lofty positions are more or less aciated, and will be solidified by being ickled," as in the case of the aureoled gures in the other portion of the restored acade—i.e., by being immersed for some ime in a lime water bath.

PIETERMARITZBURG (Natal).—The Garrison Memorial Church at Pietermaritzburg, which as consecrated on December 16th by the Bishop of Natal, is one of the finest churches o be found in South Africa. An artistic eature in the church is the pulpit, which tands upon the north side of the building. t is circular on plan, and the interior of the ostrum is gained by an easy ascent of four steps. t is built in the Early English (thirteenth ntury) style of Gothic Art, and is made ntirely of English Bath stone, as are all the arious "dressings" used in the general build- ng. Around the body of the pulpit itself is a ontinuous arcading, supported by polished ranite columns from the quarries at Peter- ead, in the North of Scotland. Carving is paringly but judiciously introduced, the rispness of the conventionalised ornamenta- ion being a most pleasing feature. A bold and most effectively moulded cornice urrounds the whole. This handsome pulpit is he handiwork of Messrs. Harry Hems and Sons, the widely-known church sculptors, of Exeter, England. It was built to the design of Messrs. Methven and Ritchie, of Durban, he architects of the general fabric.

PUDSEY.—A new Sunday school in connec- ion with the Mount Zion Methodist New onnexion Chapel, Fartown, Pudsey, has just een opened. The building consists of a entral hall 66ft. by 35ft., with ten class- ooms, five on each side, measuring about 11ft. by 10ft. each. At the south-east end is an infants' room 24ft. by 15ft., adjoining which s another class-room 15ft. by 12ft., and a kitchen 15ft. by 12ft. In the basement is a room 32ft. by 16ft., to be used as a young men's nstitute, besides a heating chamber, &c. Four ntrances have been provided for the main oom, at the south-east end of which is a plat- orm, so arranged that the adjoining rooms an be utilised as ante-rooms. The internal ittings are of varnished pitch pine throughout. The school and class-rooms are heated with ot water on the low pressure system, and the entilation has received special consideration. The central hall is lighted from the two ends and by side windows over the roofs of the lass-rooms. The artificial lighting is by means of Stott-Thorpe pendants. The build- ng, which is in a simple Renaissance style, has een erected from the designs and under the uperintendence of Mr. Herbert Hodgson, architect, Bradford and Pudsey.

UPPERTHORPE.—A stained glass window has een placed in the Unitarian chapel, Upper- thorpe, to the memory of the late Mr. Charles Woollen. The window, which is by Mr. Henry Holliday, of London, is a beautiful iece of work. The words, "There abideth aith, hope, love; these three, and the greatest f these is love," are written over the figure f Charity, who carries one child on her arm and leads another by the hand. The centre f the picture is the face, which is singularly eautiful. The colouring is soft, and in eeping.

Under Discussion.

GLASGOW ARCHITECTURAL ASSO- CIATION.

The monthly meeting was held on Tuesday week.—Mr. George S. Hill, president, in the chair. A paper by Mr. James M'Kissack, entitled "Round about Ripon and York," was read, illustrated by photographic limelight views and sketches. The paper was descrip- tive of a fortnight's tour in Yorkshire, during which time the cathedrals of Ripon and York, the abbeys of Fountains, Whitby, Jarvaux, Rievaulx, &c.; the churches of Skelton, Thirsk, Masham, &c., were visited and studied. While the views consisted mostly of ecclesiastical work, several interesting half-timber examples and Gothic domestic work were also shown.

NORTHERN ARCHITECTURAL ASSOCIATION

A meeting of the members of the Northern Architectural Association was held on Wed- nesday at Newcastle. Mr. F. W. Rich (president) was in the chair, and there was a large attendance of members. Mr. G. B. Bulmer, F.R.I.B.A., of Leeds, read a paper on "Architectural Studies in Yorkshire," which was admirably illustrated by lantern views.

EXPLORATIONS IN PALESTINE.

At a meeting of this Association, held in the Royal Institution, Edinburgh, on Wednesday, Mr. Thomas Ross, the President, in the chair, a lecture on "Explorations in Palestine and Jerusalem" was delivered by Mr. A. C. Dickie, A.R.I.B.A., of the Dundee Institute of Archi- tecture. The paper dealt with the recent excavation at Jerusalem carried out by the Palestine Exploration Fund, under the direc- tion of Dr. Bliss and Mr. Dickie. Their prin- cipal work was the recovery of the southern limits of ancient Jerusalem, and the recent explorations showed, he said, that the city once extended very much further south than the present southern boundary. The ancient wall encloses the whole of the western hill down to the verge of the Kedron valley across the Tyropeon, under the Pool of Siloam, on to Ophel, where it joins the wall traced by Sir Charles Warren from the south-east angle of the Temple area. Towers occur at short inter- vals along the wall, and three gates were found between the Protestant cemetery and the Pool of Siloam. The lecturer also referred to the discovery of a church, baths, mosaics, and tombs, and concluded with a few notes on the mode of excavation and the difficulties to be encountered. The lecture was illustrated by drawings and lantern slides, lent by the Palestine Exploration Fund.—Mr. Dickie re- delivered the lecture the following evening to the Dundee Institute of Architecture, Science, and Art. The president, Mr. T. M. Cappon, F.R.I.B.A., was in the chair.

SOCIETY OF ANTIQUARIES.

At the monthly meeting of the Society of Antiquaries of Scotland, held in their Library at the Museum, Queen Street, Edinburgh, last Tuesday week, the Rev. J. E. Somerville, F.S.A.Scot., described an ancient structure in Canna, locally called the altar. It is built of flagstones of Torridon sandstone, and contains a "cella," in which are laid a quantity of votive offerings, consisting of rounded pebble from the sea shore. The erection forms the centre of a large circle of stones about 100yds. in diameter, within which and around the altar are arranged five cairns of stones. Near it is a flagged underground passage about 2ft. square, up which to a spring of water sick people had to crawl, and were then laid in a bed made of stones and left for the night in expectation of a cure. The structure seemed to consist of what in Ireland is called a "Station," adjoining a holy well. Its form is like that of Lobar Ashig in Skye, and the Well of the Virtues in St. Kildar. Martin, describing a stone covered holy well in Gighu, which also cured diseases, mentions that the

offerings left consisted largely of pebbles of prettily-variegated stones.—There were also exhibited: by Mr. Hay Fleming, LL.D., a bronze bowl or pyx with a Celtic cross engraved on the lid, which was recently found in digging a grave in the cathedral burying ground, St. Andrews; by the committee of the Laing Free Library, Newburgh, a bronze sword brought up from the bottom of the Tay in a salmon net at Mugdrum; by Mr. Bryden, Crieff, through Mr. A. G. Reid, F.S.A.Scot., Auchte- rarder, a large and finely-polished arc of fel- stone found at Dalpatrick, Strathearn; and by Mr. R. B. Gow, Kirkland, Dalry, Ayrshire, through Dr. D. Christison, a facsimile of a posy ring, with an inscription in old French, and a basket-ring of gold ploughed up near Beith.

MASTER BUILDERS.

The second annual dinner in connection with the Hereford and District Master Builders' Association took place on Tuesday week. Mr. W. P. Lewis (president) occupied the chair, Councillor James Davies the vice-chair; and there was a large attendance.—Mr. Symonds (Cardiff) said that in reference to the relations between architects and builders, their relations in the past had not been altogether satisfac- tory; but in most cases now, he was glad to say, architects were guaranteeing their quanti- ties. Mr. A. Krauss (Bristol) drew particular attention to the scarcity of plasterers. These men kept raising their terms, and the matter would have to be dealt with promptly.

The members of the Peterhead Master Builders' Association met on the same date at their annual dinner. Mr. William Stuart, sen., builder, occupied the chair.—The function was successful and enjoyable to a high degree.

TECHNICAL INSTITUTIONS.

Addressing the Association of Technical Institutions on Thursday at their sixth annual meeting, held at the Haberdashers' Hall, Lord Spencer, on his election as president, said that as a manufacturing country we could not admit failure or retrogression in manufacturing skill. But it was impossible to ignore the fact that other nations were pushing forward the educa- tion of their children in technical training, and were rapidly increasing in consequence the amount of their commercial products. We had to look to it therefore that we were not driven out of the field. At present we were far behind America, and we could not sit still and watch the commercial and educational experiments being made abroad. There had, however, been a general movement for equip- ping our people for the race, and he thought that no Act had done more since the Act of 1870 than the Local Taxation Act of 1890. A discussion followed.

VALVE DIAGRAMS.

At a meeting of the Aberdeen Mechanical Society held in Robert Gordon's College on January 10th, a paper on "Valve Diagrams" was read by Mr. S. Pringle (Hall, Russell, and Co.). Mr. Pringle, whose paper displayed in a remarkable degree the technical value of mathematics as applied to practical engineer- ing, touched in a general way, at the outset, on valves and valve motion. Then he dipped into the fundamental principles of Zeuner's diagram, the application of which to the solution of mechanical problems is familiar to all engineers. He next took up the question of the effects of Stephenson's link motion, so far, at least, as concerned the geometrical representation of the effect; and explained graphically the method of ascer- taining the forward and backward motion of the piston. He concluded by applying these principles to the manufacture of triple expan- sion marine engines. The lecture was followed by some lively discussion, chiefly with regard to the practical value of Zeuner's diagram. The preponderating opinion was with the lecturer, that the agent by the use of which the marvellous "Greyhounds" of the Atlantic were being turned out was one which engi- neers could not afford to despise. The paper was illustrated by carefully-drawn diagrams.

HIGH PRESSURE BOILERS.

Mr. W. Davis, A.I.E.E., of the Engineers' Department of the Stock Exchange, gave a lecture on "High Pressure Boilers," at the St. Bride's Institute, on Wednesday, before the Association of Parochial Engineers and Engineers in Charge. The lecturer dealt with the subject in a masterly manner, and a vigorous discussion followed. Mr. G. Brady, the chairman of the Whitechapel Health Committee, presided.

SANITARY INSPECTORS' ASSOCIATION.

The president of the Sanitary Inspectors' Association, Sir John Hutton, in the course of his annual address to the members at Carpenters' Hall, London Wall, said that the Association, numbering 685 members, practically represented all England, and several of the provincial branches, particularly that at Belfast, were showing active, vigorous life. The sanitary administration of London was a work of the utmost difficulty. The congregation of 4,464,717 persons in anything like sanitary safety was not a light accomplishment. Of London's forty-three sanitary districts the largest (Islington) contained a population of 341,134, but there were others, like Lambeth and Camberwell, nearly as large. It was therefore most satisfactory to find the death-rate of London 1904, or considerably less than that of Manchester, Liverpool, Leeds, Birmingham, Sheffield, and other large towns. Among other topics considered in the address were dust-destructors, by which the power of generating electricity for lighting purposes was made possible, food and meat inspection, cremation, and the preparation of ice-creams.—A cordial vote of thanks was accorded to the president for his address.

A NEW INSTRUMENT FOR TESTING ROAD SURFACES.

At a meeting of the Belfast Natural History and Philosophical Society, on January 10th, Mr. John Brown, of Dunmurry, read a paper on "The Viagraph, a New Instrument for Testing Road Surfaces." Mr. Brown referred to the notorious fact that Irish roads were as a rule much worse than those in England. Till now, however, no means existed of making an accurate comparison, of telling how much, and in what way, English or foreign roads were better than those in Ireland. It was in the hope of providing such means, and thereby attempting to convince Irish local authorities of the great need of improvement, that the viagraph had been designed. It consists practically of a straight-edge

applied continuously to the road (along the surface of which it is drawn) combined with a moving part, consisting of a serrated wheel free to follow the unevennesses of the surface, rising and falling over these freely. While the sledge-like straight-edged runners of the main frame cause it to neglect these unevennesses and to preserve a sufficiently even path over them, the vertical movements of the road wheel are transmitted to a pencil marking their amplitude upon a paper strip, which is at the same time drawn under the pencil point by the rotation of a drum driven by gear connected to the road wheel. The result is a profile of that part of road surface over which the machine has been drawn, made on a scale of $\frac{1}{2}$ in. to the foot longitudinally, and full size vertically. A second pencil provides a datum line corresponding to the profile that a perfectly even road would produce. A number of diagrams were exhibited, showing profiles of roads in Antrim, Down, Norfolk, Suffolk, Surrey, Devonshire and Lancashire. The records of the instrument (said Mr. Brown) would be of use to those criticising the state of the roads in any district, also to surveyors wishing to test various methods of road maintenance or to convince their county authorities of the need of improvement, or of the advantages already obtained by a given treatment. They would also be valuable to cyclists and others desirous of knowing the condition of the roads in any distant district in which they propose to travel.

Enquiry Department.

MATHEMATICAL INSTRUMENTS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—In reply to "G. W. B." in your issue of December 28th, I don't think the books mentioned deal with his subject, as the steel square is a mechanic's instrument, not a draughtsman's, although more used as such in the United States of America. The two books I know that deal with the subject are L. D. Gould's "Carpenters' and Builders' Assistant," price 2/50 dols. (10s. 6d.), and "Steel Square Problems," by the same, 1/00 dol. (4s. 6d.). The latter, which could be got from Spon's, is more suitable, as it deals with the one subject only. Personal demonstration (as you suggest) is best, but the steel square is not used to the same extent in England as in the United States.—Yours faithfully,

FRANK J. LOBLEY.

Views and Reviews.

AN ELEMENTARY GEOLOGY.*

Among the many scientific subjects of which architects have to possess some knowledge, that of Geology is prominent, and Skertchley's little book, of which a new edition, revised by Dr. Monckman, has recently been published, meets their elementary requirements well. Whether Skertchley's theories and assumptions are always sound may possibly be open to question, but these matter little to the builder of to-day, who only requires to know how matters are at present; and even for the sake of the investigator, who would probably soon develop ideas of his own upon these points, the new editor is probably right, as he says in his preface, in taking care to do nothing to impair the individuality which is the great excellence of the work. The chapters upon the formation of the earth are of considerable interest, but of far more practical value are those dealing with the stratigraphical arrangement of the rocks, their fossil contents, and their mineral constituents; and they have the advantages of being those most free from theorising, well arranged, fully illustrated, and clearly expressed.

* "Skertchley's Geology, revised in accordance with the latest requirements of the South Kensington Syllabus," By James Monckman, D.Sc. (London). Ninth Edition. Price 1s. 6d. (Murray's "Science and Art Department" series of text-books.) London: Thomas Murby, Ludgate Circus Buildings, E.C.

NORTHUMBRIAN MASONRY.*

This very interesting account of many of the incidents in the development of a craft that has been ennobled by long contact with the highest in our land will be read with pleasure by many. Too often, handicraftsmen are inclined to imagine that their work is beneath them—a perusal of this work will create a pride if none exists in the bosoms of such, and probably incite them to take a deeper interest in the work they may be engaged in. Not the least instructive portion of the work is the indication of the teaching, or class work in connection with the mason of the mediæval day. The many references to the quaint customs of bygone times, the curious day divisions, and the secretive properties of the lodge of the operatives well repay perusal.

The interlocking of the freemason with the operative mason is of interest to many outside the trade. To those in the trade—in days when happily there is again a desire for the use of stone, no book, other than one of a purely technical nature, will be more thoroughly enjoyed.

BROSELEY ROOFING TILES,

"LIGHTMOOR" BRAND.

PUTNEY—For the erection of stabling and coachman's cottage at Chartfield, Putney Hill. Mr. A. R. Thorn, architect, Elm Park Estate Office, 268, Fulham-road, S.W.:—
H. Parsons and Co. ... £1,300 | G. E. Selman* ... £1,000
H. Roffey ... 1,276 | *Accepted.

TAUNTON—For the execution of sewerage works, Target Field, for the Town Council. Mr. J. H. Smith, C.E., Municipal Offices, Corporation-street, Taunton:—
Allen and Son ... £9,302 9 0 | G. Bell ... £7,805 0 0
R. H. B. Neal ... 8,470 0 0 | W. S. Meredith ... 7,700 0 0
W. Gibson ... 8,441 16 7 | B. Cook and Co.,
Facey ... 8,300 0 0 | 16, Victoria-
H. W. Pollard ... 7,998 0 0 | street, West-
R. Hitchcock ... 7,882 19 0 | minster* ... 7,518 0 0
*Accepted.

TOTNES (Devon)—Accepted for the construction of sewage and outfall works, also buildings, &c., for the Tubes Corporation. Messrs. Lomax and Lomax, C.E., engineers, Deansgate, Manchester:—
George Bell, contractor, Tottenham and Man-
chester ... £8,854

TWICKENHAM—For the supply of 500 tons Guernsey granite spalls, for the Urban District Council. Mr. F. W. Pearce, surveyor, Town Hall, Twickenham:—
L. Somerfield ... 12 3 | R. L. and J. Fennings,
W. Griffiths ... 11 5 | London Bridge* ... 10 10
J. Mowlem and Co. ... 11 2 | *Accepted.

CONTRACTS OPEN.

STEPNEY UNION.

TO BUILDERS AND CONTRACTORS.

The Guardians are prepared to receive TENDERS for certain ALTERATIONS and ADDITIONS at the Ratcliff Workhouse in Salmon-lane, Ratcliff, E.

The drawing and specification can be seen, and bills of quantities, prepared by Mr. B. BANKS MARTIN, Architect, 103, Plashet-grove, East Ham, obtained at the Guardians' Offices, as below, on payment of a deposit of Two Pounds Two Shillings, which will be returned to persons sending in a bona-fide Tender.

Sealed Tenders must be delivered at the Offices before NOON on THURSDAY, the 26th instant, and persons tendering must be in attendance at FOUR o'clock on that day.

The contractor will be bound in the contract to pay trade union rate of wages.

The Guardians do not bind themselves to accept the lowest or any Tender.

S. A. LEWIS,
Clerk.

Guardians' Offices,
Barnes street, Stepney, E.
January 5th, 1899.

WIMBLEDON URBAN DISTRICT COUNCIL.

TO BUILDERS.

The Council hereby invite TENDERS for the ERECTION of an ISOLATION HOSPITAL, to include Three Wards Blocks, Administrative Block, Cottage, Receiving and Discharging Block, Laundry and Disinfecting Station, and Mortuary, on site off Gap-road, Wimbledon.

Bills of quantities, with form of Tender, can be obtained on payment of £5 5s; (which will be returned on receipt of a bona-fide Tender) from C. H. COOPER, A.M.I.C.E., Surveyor to the Council, at the Council Offices, Broadway, Wimbledon, where plans and specification may be inspected.

The Council do not bind themselves to accept the lowest or any Tender.

The contractor whose Tender is accepted shall enter into a formal agreement, under seal, with sufficient sureties, for the due fulfilment of this contract.

Sealed Tenders, addressed to me, and endorsed "Tender for Isolation Hospital," to be delivered at the Offices of the Council, Wimbledon, by NOON on MONDAY, FEBRUARY 13th, 1899.

By order,

W. H. WHITFIELD,

Clerk to the Council.

January 6th, 1899.

TOTTENHAM URBAN DISTRICT COUNCIL.

REFUSE DESTRUCTORS.

The Council invite the submission of DESIGNS for a REFUSE DESTRUCTOR, to be erected within their district.

Three premiums of £25, £15, and £10, will be awarded for the three best Designs, in order of merit. Designs to be sent not later than TWELVE o'clock noon on TUESDAY, FEBRUARY 7th, 1899.

Particulars and plans of sites may be obtained on application to Mr. P. E. MURPHY, Engineer to the Council, at their Offices, Coombes Croft House, 712, High-road, Tottenham, any day during office hours.

By order,

E. CROWNE,

Clerk of the Council.

Offices, 712, High-road, Tottenham,
January 13th, 1899.

TO BUILDERS.

The Commissioners of H.M. Works and Public Buildings are prepared to receive TENDERS for the ERECTION of NEW GOVERNMENT OFFICES in Manchester.

Drawings, specification, and a copy of the conditions

and form of contract may be seen on and after the 16th instant on application to the Registrar, Probate Registry, Manchester.

Bills of quantities have been prepared for the use of Builders by Messrs. J. S. LEE & SON, of 35, Craven-street, London, and, together with forms of Tender, may be obtained at the undermentioned Office on payment of One Guinea.

The sums so paid will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Commissioners do not hold themselves responsible for the accuracy of the quantities, nor do they bind themselves to accept the lowest or any Tender.

Tenders are to be delivered before TWELVE o'clock noon on MONDAY, the 30th inst. addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W. and endorsed "Tender for Government Offices, Manchester."

REGINALD B. BRETT,

Secretary.

H.M. Office of Works, &c.

January 12th, 1899.

LITTLE ILFORD SCHOOL BOARD.

The School Board for Little Ilford, Manor Park E., invites TENDERS for the ERECTION of SCHOOL BUILDINGS, OUTBUILDINGS, CARETAKER'S COTTAGE, &c., proposed to be erected in the Bess borough-road, Little Ilford.

Plans and specifications may be inspected at the office of the Architect, Mr. S. JACKSON, 65, Fenchurch-street, E.C., after JANUARY 12th, 1899.

Application for bills of quantities, prepared by Mr. Walter Lawrance, 30, Hart-street, Bloomsbury, W.C. to be made to the Architect at the above address on or after JANUARY 12th, accompanied by a £5 Bank of England note, which will be returned on receipt of a bona-fide Tender.

All Tenders must be delivered at the Clerk's Office on or before JANUARY 25th, in the official envelope provided.

The person whose Tender is accepted will be required to enter into a bond with two sureties for the due performance of the contract.

The Board does not bind itself to accept the lowest or any Tender.

JNO. S. APPLETON,

Clerk to the Board.

769, Romford road,
Manor Park, E.

234.—WASH-OUT.

SAMUEL HUNT ROWLEY, Swadlincote, nr. Burton-on-Trent.

PATENTEE AND MANUFACTURER OF THE

"WASH-OUT" CLOSET (PATENT).

Three Awards at the International Medical Sanitary Exhibition, South Kensington, 1881. Specialities in Closets, Traps, Urinals, Lavatories, Sinks, and other Sanitary Fittings.

Price Lists and Full Particulars on Application.

Telegrams:—"ROWLEY, SWADLINCOTE."

BRICKS.

LIME.

CEMENT.

EASTWOOD & Co. Limited

47, BELVEDERE ROAD, S.E.

HALL'S

SANITARY WASHABLE DISTEMPER (PATENTED),

A NEW SANITARY WATER PAINT,

HAS great advantages, some of which are as follows:

It Sets Hard, Kills Vermin, and Disinfects.

It is Washable in 3 Weeks, Does not Scale, can be Painted or Varnished, and will Stand Inside or Outside.

It is made in Dark Rich Shades as well as in Light Tints, contains no Lead, and Does Not Turn Black.

It only requires the addition of Water to make it ready for use, so that anybody can apply it.

It is Cheaper, Cleaner, Healthier, and more Artistic than Wall Paper.

It is Sold by leading Chemists, Drysalers and Ironmongers, and Manufactured by

SISSONS BROTHERS AND CO. Limited, HULL,

From whom Samples, Shade Card, and other particulars can be obtained.

FOREIGN AGENTS WANTED.

MEASURES BROTHERS, LTD. LONDON.

SIEMENS-MARTIN AND BESSEMER STEEL JOISTS.

MEASURES' JOISTS ARE THE BEST AND CHEAPEST IN THE MARKET.

Have now in their Town Stock 6500 tons of STEEL JOISTS, 3in. to 20in. deep; also 1000 Tons of Iron Joists, Channels, Tees, Angles, Plates, &c. Riveted Girders, Fireproof Floors, Stanchions, Columns, Chequered Plates, Rails, Bolts, &c.

SECTION SHEETS AND ESTIMATES ON APPLICATION.

Prompt Delivery from Stock. Steel Joists specially adapted for Pit Props and Colliery Work.

SUPPLEMENT FOR

SVRVEYORS · BVILDERS ·
SANITARY ENGINEERS ·

JANUARY 18TH, 1899.

BOYLE'S PATENT "AIR-PUMP" VENTILATOR.

THE LATEST PATENT HAS DOUBLE THE EXTRACTING POWER OF EARLIER FORMS AND IS ONE-HALF THE COST.

ROBT. BOYLE & SON, LTD., 64, Holborn Viaduct, LONDON; & 110, Bothwell St., GLASGOW.

See Large Advertisement, Back Page, Monthly.

INTRODUCTION OF NON-FLAMMABLE WOOD INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to

Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following

UNITED STATES WAR VESSELS:—

BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."

And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.

"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—

THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).

"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.

Address all applications to the General Manager,

BRITISH NON-FLAMMABLE WOOD CO. Limited,

2, Army and Navy Mansions, Victoria Street, London, S.W.

THE EVOLUTION OF THE ARCH.

BY CHARLES W. TOMLINSON.

FEW great inventions have sprung into full perfection at one bound, most of them having gone through a long and tedious process of development or evolution. So with the arch. It is hardly probable that the mind of any single man could, if he had only been accustomed to a trabeated style of construction, conceive the idea of spanning an opening by a number of small blocks of material, maintaining their equilibrium by mutual support.

It is a very common opinion that the Egyptians did not know of the arch, but Sir Gardner Wilkinson—who should certainly speak with authority on the subject—mentions several instances of tombs being vaulted with bricks; for instance, one of Amenoph I. at Thebes, about 1540 B.C.

Fergusson says that it is probable that the Egyptians knew of the arch, but would not employ it, as it would introduce an element of complexity into their otherwise simple designs. He also says that in the present day, the Mahometans in India use the arch a great deal. Yet, in the same country, the Hindoos will not employ it on any consideration, having a proverb "An arch never sleeps," meaning

FIG. 1.

FIG. 3.

FIG. 2

FIG. 5

that its constant and never ceasing thrust is always tending to pull the building to pieces.

One may imagine the arch to have originated in this wise: The builder, having an opening to bridge, and finding none of his stones long enough for a lintel, conceived the idea of putting two of them at a slope, resting against one another in the centre (Fig. 1), as was actually done in the uppermost portion of the King's chamber in the Great Pyramid (Fig. 2). As long as their bases were prevented from sliding the stones could not fall, and, needless to say, with the whole mass of the Pyramids behind them, there would be no fear of this catastrophe occurring. Instances of the same form of arch may be seen in our own country at Barnack, Northamptonshire (Fig. 3). The next step would be to make the two stones into three, as shown in Fig. 4. An example of this occurs in a tomb near the Pyramids at Gizeh (Fig. 5), in which we have the primitive form of arch below, but with a regular arch of four courses above. The three stones of the arch then would soon develop into five, and the rest would be simple until the correct semicircular arch was fully developed.

FIG. 6

This is one line along which the arch may have been evolved. But a parallel line runs near along which the arch may have been completed, but which terminates in the pointed arch.

Imagine an opening, bridged by the courses, being corbelled out gradually until one moderate-sized stone could act as a lintel (Fig. 6). As an actual example, see the section of the grand gallery in the great Pyramid (Fig. 7). The next step would be to knock off the angles of the corbels until an arch was obtained as at Missolonghi (Fig. 8, from Dodwell's "Greece"). Another step and the angles would be struck off to a curve (Fig. 9, from Dodwell) as at Thoricus, but still with the joints horizontal. It is, not a great step then to radiate the joints, and the correct pointed arch is obtained.

These are but speculations, but that they are probably sound seems borne out by the actual examples. Anyhow, we do know this, that no examples of the arch occur in Grecian Architecture, whether its existence was known or not. The Romans were the first to use it to any great extent, and they even carried it further, inventing the dome, though the dome is ante-dated in the treasury of Atreus at Mycenae, which gives, indeed, a primitive form of the dome, though the joints are horizontal. The Romans did not use the pointed arch, but it would be going a great length to say that they were not aware of its existence. The first instances of its use occur in Provence in the eleventh century.

How was it evolved? On the lines already suggested? Or was it an accident, or thought out by some master builder with a master mind? A legend used to be told about the intersecting branches of trees over a woodland walk giving the idea, and again, the accident of the intersections of a double arcade suggesting the notion. Or, further, some architect builder, wishing to make his nave arcade higher and more imposing, may have sat down, and with much thinking solved the problem by using two centres, and striking his curves till they met.

Once the pointed arch was invented, the rest would be easy; the horseshoe, the trefoiled arch, the three-centred, the four-centred, and the oggee, would all soon be successfully experimented with. In fact, the arch seems to have been continually developing, as the flat arch is comparatively a modern idea, while the skew or oblique arch belongs to even more recent times.

FIG. 7.

BYE-LAWS RELATING TO NEW STREETS AND BUILDINGS.

BY J. S. PICKERING, A.M.I.C.E.

IT is proposed in this paper to refer more particularly to bye-laws made in England under the provisions of the Public Health Acts rather than to bye-laws made under local Acts, but the remarks made will apply in some measure to bye-laws with reference to sanitary matters in general.

The Public Health Act, 1875, empowers sanitary authorities to make bye-laws with respect to new streets and buildings, and repeals previous Acts under which such bye-laws were made. But it provides that bye-laws made under these repealed Acts are to be deemed bye-laws under the Act of 1875 if not inconsistent with the provisions of such Act.

In 1877 the Local Government Board drew up a "Model" series of bye-laws for the guidance of local authorities. These have been somewhat amended from time to time, and have been framed with great care, and under the best legal advice. What is also of the utmost

FIG. 8

FIG. 9

importance, their provisions are considered to be in accordance with the statutory enactments by which they are authorised. But, notwithstanding these conditions, the "Model" bye-laws have not been received with general approval.

It is true that bye-laws made since the passing of the 1875 Act generally adhere closely—and in the greater number of cases almost word for word—to the "Model" series; but this is not so much on account of their general suitability to the districts for which they are adopted, as to the fact that the Local Government Board will not sanction any important departure from their "Model" code. The result is that many authorities do not possess any bye-laws at all, others depend upon bye-laws of doubtful validity made under former Sanitary Acts, while the great majority do not enforce the particular bye-laws they have been compelled to include in adopting the "Model" series.

It is somewhat astonishing that this state of affairs should be allowed to continue with the extension of local government which has taken place in the country, and when there is a general desire on the part of local authorities to carry out the provisions of the Sanitary Acts.

The varying circumstances of different

districts make it impossible to frame a series of bye-laws applicable to all. Bye-laws, for instance, affecting new streets and buildings in large towns would be altogether unsuited to the requirements of say the villages of rural districts. But obvious as this is, it is a matter which is overlooked, and accounts for the absence of bye-laws in many Rural Sanitary Districts.

Section 157 of the Public Health Act, 1875, provides that every Urban Authority may make bye-laws with respect to the following matters; the level, width, and construction of new streets, and the provision for the sewerage thereof; the structure of walls, foundations, roofs and chimneys of new buildings for securing stability, and the prevention of fires, and for the purposes of health; the sufficiency of the space about buildings to secure a free circulation of air, the ventilation and drainage of buildings, and the closing of buildings unfit for habitation.

Surely these provisions are of sufficient importance to make their adoption imperative. Possibly twenty-three years ago, when the Act came into force, it would not have been desirable to make the adoption of bye-laws compulsory, but considering the advance of sanitary science since 1875 and the general determination of the community to live in greater comfort, and consequently under healthier conditions, there now appears to be no valid reason against the adoption of proper bye-laws in every sanitary area. It is evident that the Legislature do not accept this view, or they would not continue to make the adoption of important sanitary measures permissive on the part of local authorities.

The Public Health Acts Amendment Act, 1890, contains many important provisions affecting the health of the community, but they cannot be put into force without months of delay in complying with the wearisome details provided for in the adoption of the Act. Section 23 of this Act gives to sanitary authorities increased powers as to making bye-laws affecting new streets and buildings. Under this section a bye-law may be made with reference to the height of bedrooms and other rooms used for human habitation. It seems almost incredible that, until the passing of the 1890 Act, sanitary authorities had no control over the height of such rooms, although many authorities possessed a bye-law fixing their minimum height. This was one of many bye-laws inconsistent with the provisions of the Public Health Act, 1875, and therefore *ultra vires*, but it has been carried out as though it possessed full legal force.

In many of the larger towns bye-laws made under the Public Health Act, 1848, the Local Government Act, 1858, and other Acts repealed by the Public Health Act, 1875, have not been amended, though repugnant to the laws of the country, and the authorities possessing them prefer to retain these, trusting to their legality not being questioned, rather than adopt the more modern bye-laws as sanctioned by the Local Government Board. This position on the part of local authorities should scarcely be possible; in any case it should not be a necessary position to take up in order to secure bye-laws adapted for the health and convenience of a district, for it must not be overlooked that many of these ancient bye-laws, as in the case of the one referred to, are eminently desirable, whatever may be said of their validity from a legal point of view.

Bye-laws made under Acts previous to the Public Health Act, 1875, are, as a rule, so conveniently elastic that this is another reason given for their retention in preference to the rigid bye-laws of the present day. The following are specimens of the bye-laws in force in a town with a population of upwards of 130,000:—

"The walls of every new building shall be constructed of such thickness as shall be approved by the said Council."

"The owner or occupier of every house shall provide proper ventilation in the drainage thereof by means of the rain-water pipe from the roof of the house, or by such other method as the said Council shall direct."

These are a striking contrast to the detailed

bye-laws referring to the thickness of walls and the ventilation of drains in the "Model" series, and yet they are only examples of similar bye-laws in force in numerous large towns.

Another convenient old bye-law is one giving the authority discretionary power with respect to the enforcement of air space at the rear of buildings. The Local Government Board will not now sanction a new bye-law which provides for this discretionary power. But most sanitary authorities, nevertheless, do not hesitate to exercise their discretion when an occasion arises, such for instance as in the pulling down and re-erection of a building where the provision of the bye-law cannot be adhered to without considerable sacrifice of property. It may of course be contended that the air space is necessary for the health of the occupants of a dwelling wherever the building is situated, and more especially in a populous district where property as a rule is the most valuable. But an authority has often either to allow a building to be re-erected (and possibly improved from a sanitary point of view) without the requisite air space, or submit to it being altered in such a way that it will not come within the scope of the bye-laws as a new building. Discretion in a case of this description seems desirable, but it must be admitted that any general admission of discretionary power in the bye-laws would probably result in frequent acts of indiscretion on the part of some authorities.

Bye-laws of the "Model" series relating to the thickness of walls are seldom carried out in their entirety, especially where they have been adopted in the smaller towns and rural districts, where there is often a feeling that their enforcement may prejudicially affect the desirable growth of the district. So far as bye-laws can be prepared to meet the varying conditions affecting the thickness of the walls of a building, the "Model" bye-laws do not appear to leave much to be desired. Possibly the thickness prescribed for the walls of small houses up to three storeys might be somewhat modified to meet the objections usually raised against them in the smaller districts; but there will always be a difference of opinion as to what should be regarded as the reasonable and necessary strength of a building, and much will, of course, depend upon the quality of the material and workmanship.

As the powers and privileges to make (and necessarily to enforce) bye-laws under the Sanitary Acts have not been so fully appreciated as the framers of the Acts must have anticipated, it is a question as to the proper course to be adopted to bring about a better state of things. That it is desirable for all sanitary authorities to have proper bye-laws affecting new streets and buildings there can be no doubt. However seldom it may be necessary to bring such bye-laws into operation, they will be of service at some time or other, even in the most sparsely populated districts. If then suitable bye-laws are essential in rural districts, how much more important that populous towns should possess bye-laws framed with the highest possible considerations for health and convenience. This in the author's opinion will only be brought about by the adoption of bye-laws being made compulsory, and a greater latitude being given to sanitary authorities to frame bye-laws adapted to their own particular districts.

But the possession and value of bye-laws will be of little effect if the necessary means are not adopted for enforcing them. Even in districts where there is an apparent desire to see the bye-laws strictly carried out, the surveyor's staff is generally so inadequate that the necessary amount of supervision cannot be given. In the author's opinion no new house should be occupied without a certificate from the surveyor that it has been erected in accordance with the bye-laws, and is fit for human habitation. But it would be manifestly unfair to expect a surveyor to give such certificate unless he had satisfied himself by systematic and regular supervision on the part of a competent staff during building operations that such certificate was justified. Then again, such a certificate could not be given

where the bye-laws were not enforced. In some of the older bye-laws this certificate is required to be given, but it is not probable that a bye-law would now be sanctioned to this effect. Indeed, it would scarcely be desirable until the necessity for a better supervision of new buildings is recognised by sanitary authorities.

It appears to the author that many provisions contained in bye-laws might with advantage be incorporated in the Sanitary Acts, making them statutory enactments rather than measures to be adopted at the option of local authorities. It also seems desirable that bye-laws should be made less comprehensive, many matters of detail now included being made the subject of regulations varying according to the requirements of each particular district. Under these conditions a general series of bye-laws more acceptable than the present "Model" series could probably be framed, and sanitary authorities would be able to include in their regulations many important matters which would make bye-laws cumbersome and unnecessarily lengthy. In the case of new streets, for instance, the bye-laws might very properly lay down the requirements as to widths under various conditions, but the actual method of construction would be better dealt with in detailed regulations, forming a practical specification of the requirements. Then again, matters connected with the drainage of a building could be more conveniently and in greater detail be referred to in regulations. It would add to the value of such regulations to accompany them with a complete set of descriptive drawings.

Many authorities supplement their bye-laws with regulations as to drainage and other matters, but as these are not confirmed by the Local Government Board, and very frequently contain conditions which could not be legally enforced, they cannot be said to be wholly satisfactory.

In any revision of the "Model" bye-laws and the Acts under which they are framed, the author is of opinion that the Incorporated Association of Municipal and County Engineers might afford most valuable assistance. Throughout the Sanitary Acts and the "Model" series of bye-laws there are many technical defects which the municipal surveyor could very readily rectify, and thus put an end to much unnecessary litigation. The Local Government Board in 1877 acknowledged the assistance rendered by the Royal Institute of British Architects in framing the bye-laws dealing with new streets and buildings, and they would, no doubt, equally value the help of a professional body whose members must by their every-day experience possess a most intimate knowledge of the subject.

It is to be hoped that the time is not far distant when every sanitary authority in the country will be in possession of bye-laws which it will be deemed a duty to carry out in the interests of the health of the community.

THE Board of Trade has authorised the construction of a light railway from Porthywaen, in the county of Salop, to Llangynog, in the county of Montgomery.

New boilers and mains have recently been put down at the York Street Gasworks, Leeds. The two new boilers, which are of the Lancashire type, are 25ft. long and 7ft. in diameter, and work at a pressure of 100lb. to the square inch. The new mains are of 24in. as compared with 18in., the size of the old ones. An iron tank has been erected over the boiler house. It is about 35ft. long, 20ft. broad, and 6ft. deep.

A BILL to authorise the construction of railways in the counties of Cardigan, Montgomery, and Radnor, has been deposited for next Session, under the title of the East and West Wales Railway. By this scheme, it is proposed to incorporate a new company for the purpose of constructing a railway nearly 48 miles in length, commencing in the parish of Llanilar by a junction with the Manchester and Milford Railway, and terminating at New Radnor by a junction with the New Radnor extension of the Kington and Eardisley Railway.

MEASURING STANDING TIMBER.

AS most persons are aware, it is decidedly difficult to the unpractised eye to correctly estimate the contents of trees when standing. By careful practice, however, the eye can be trained to estimate distance and size with considerable accuracy, and many men after proper study and training are able to arrive at the dimensions of standing timber with great facility and correctness. The height of a tree can be measured in a variety of ways, but simplicity and ease are the great desiderata.

In employing an optical instrument of any kind for measuring, the operator must place himself on a level with the base of the object to be measured. In using the apomecometer or hypsometer this is not always easily done, as the observer has to be at a distance from the object equal to the height to be measured, but with a sextant the case is different, and the attainment of a proper position is less difficult. If the index of the sextant is set at 45deg., then it is used in the same way as the apomecometer or hypsometer (with which it is presumed most readers are familiar) at a distance from the object equal to the observer's height, but with the index set at 36deg. 30min. the distance of the operator from the base would be just half the height of the object, and a position on a level with the object would be more easily obtained.

To practise with this instrument, begin by measuring a tree; put a mark on the tree at the height of your eye above ground. A knife, nail, or bradawl stuck in the bark through a piece of white paper is a good mark. Then if the ground be pretty level, set the index of the sextant at 45 deg., and walk backwards in the plane of the tree until the part of the tree, the height of which you wish to ascertain, is shown in the glasses of the instrument as level with the mark stuck in the tree; the product is the height required. Should the surface of the ground be very irregular, or brushwood or other obstacles obstruct a sight at 45 deg., set the index to 63 deg. 30 min., perform the operation as already described, but double your distance from the tree, and add thereto the height of the eye or mark for the required height of the object. To use the sextant for this purpose, set the index to the necessary angle, take the bottom of the instrument in the right hand, hold it in a vertical position, with the index facing to the left, look through the eyehole and unsilvered part of the object glass at the mark on the tree, and move backward or forward until the point, of which the height is to be ascertained, is reflected from the index glass to the silvered part of the object glass, and appears exactly on a level with the mark on the tree; then, according to the angle at which the instrument has been set, calculate the height.

After a little of this practice, the eye becomes trained to estimate the quarter girth of a standing tree with considerable accuracy. A good method of practice is to watch the felling of trees. Estimate by the eye the dimensions of a tree while standing, and then measure for proof when the tree is on the ground, comparing the actual dimensions with those of the estimate. It is also advisable to practise comparisons of girth by girthing the tree as high as you can reach conveniently, say 5ft. from the ground, and accustoming the eye to estimate the difference between that girth and the size of the tree at any other part of its height. This method of comparison is very useful for confirming previous guess estimates, but for nothing else.

When estimating the contents of standing trees, the quantity of measurable timber in the tops should also always be taken into account. Oak tops are sometimes of considerable value, and when the calculation includes their measurable contents, the probable yield of bark can be pretty accurately foretold. Hedgerow trees having heads large in proportion to the size of bole will not yield so much bark per cubic foot of timber as trees grown in clumps; and the difference may vary from 1½lb. to 2lb. per cubic foot. W. N. B.

Surveying and Sanitary Notes.

THE Guildford Corporation has been fined £5 for polluting the River Wey by the discharge of sewage. The Thames Conservancy Board were the prosecutors.

THE Tramway Committee of the Glasgow Corporation have approved of an agreement between the Corporation and the Renfrew County authorities for the erection of a new bridge over the Cart at the village of Cathcart. The bridge is to be 50ft. wide, and to cost £8000.

SIR REDVERS BULLER has given orders for the quartermasters of regiments at Aldershot to attend a course of lectures on sanitation and the prevention of disease in barracks during the present and next month at the Training School of the Royal Army Medical Corps.

THE Corporation of Blackpool have applied to the Local Government Board for permission to borrow £6132 for works of street improvement. The proposed improvements consist in paving the two main thoroughfares of the town—Church Street and Talbot Road—with hard wood.

THE Upper Stour Valley Drainage Board have on hand a scheme for extending the main sewers and making increased provision for sewage disposal. Application has been made to the Local Government Board for permission to borrow the £16,785 which the proposed improvements will cost.

At a special meeting of the Warrington Town Council a resolution was passed approving the promotion of a Bill in the next session of Parliament for the construction of additional waterworks and the improvement of the Borough of Warrington in various ways. To carry out all the proposed improvements will involve an expenditure of £418,000.

MR. SANG, civil engineer, Kirkcaldy, has completed his plans and drawings for the proposed new road and viaduct to be made to connect Kirkcaldy and Pathhead. There is a difference of opinion in the Town Council as to the cost of the undertaking, some averring that £20,000 would be expended; but the Council sanctioned the scheme on the understanding that it was not to exceed £14,000.

A MEMORIAL has been deposited in Parliament against the London County Council's Water Bill. It bears the signatures of over 100 persons who are interested in the property which is proposed to be taken for the Yrfou and Wye Valley reservoirs. It is anticipated that the contest before the examiners will last at least a fortnight, and will necessitate the bringing up of a considerable number of witnesses from Wales.

A REPORT by Mr. Young, general manager, has been submitted to the Tramways Committee of the Glasgow Corporation with reference to the operating of the electric cars on the Springburn route. The report says that the overhead system has been in operation for a period of ten weeks. It is still rather soon to give a definite figure as to the amount of the working expenses under electric traction, as the condensing plant has not yet been in operation; but, after including a fair sum for maintenance and renewals, it may be taken that the total working expenses will not exceed 6½d. per car per mile. The average working expenses under horse traction may be taken at 8½d. per car per mile, although during the last financial year the amount worked out at slightly under that figure.

THE Paisley Water Commissioners, who have been investigating the alleged pollution of streams at Stanely, have come to the conclusion that while it did not appear that any pollution was yet taking place, such might

occur, and the conduit at Nethercraigs should be safeguarded from such a possibility. A 7ft. wall is about to be erected at the part of the conduit where it was feared pollution might take place, and this is expected to effectually prevent any such occurrence. The Commissioners have also decided to submit samples of the water to chemical analysis.

AN alarming accident occurred last week at the Nutclough Fustian Society's works, Hebden Bridge. In order to meet the wishes of the West Riding County Council, the firm had constructed two huge brick tanks for the purpose of filtering the dye-water before it is turned into the river. One of them, measuring 28ft. by 19ft., had been filled with dye-water to the depth of 10ft., and a strong current of steam turned into it, when the outer wall, running alongside the river, was bodily forced out, and carried almost across the river bed. Happily no one was injured. The damage is estimated at £120.

At a dinner to the members of the Elland District Council, the Chairman, Mr. J. F. Crossland, referred to the various improvement schemes which were on hand. The sewage works, he said, were far from being the "white elephant" which they were described. The estimate of the cost was 6½d. in the pound, and the actual cost had been 6¾d. Active steps would be taken to erect the baths during the present year. He believed progress would be made in the direction of introducing electric light. The question whether or no the Halifax Corporation should be asked to extend their tramways to Elland would be shortly decided.

At a meeting of the Rawdon District Council on Tuesday evening, Mr. A. J. Pratt presiding, a letter was read from Mr. A. N. Briggs, a property owner, asking if anything was being done by the Council in opposing the bringing of Bradford sewage to Esholt.—The Chairman said he had informed Mr. Briggs that a town's meeting would probably be called to discuss this matter. Personally, he was against the Bradford Corporation's proposals, but before any expense was incurred by the Council in opposing the scheme the ratepayers should be consulted.—The Council decided that a ratepayer's meeting should be summoned to consider the matter.

WE understand that the Bingley District Council has approved the scheme prepared by Mr. R. Armistead, civil engineer, for the completion of the sewage disposal works at Dowley Gap and the making of the necessary main sewers from the outlying portions of the district, at a total cost of some £23,000. The disposal works are to be laid out for treatment on the biological system, upon which Mr. Armistead reported favourably some months ago when he prepared his draft scheme for the Council, and of which the Leeds and Manchester Corporations have recently expressed strong approval. At the works the sewage will first flow through a grit chamber, 44yds. long by 5ft. wide, where the solid matter will be arrested, provision being made for this to be washed out and discharged upon the low-lying land. From the end of this chamber the sewage will pass into the inlet carrier, and thence into the covered tanks by means of inverted pipes, discharging 3ft. below the water level. Four tanks are to be provided of a capacity equal to 70 per cent. of an estimated daily flow of 1,000,000 gallons. Storm overflows will be conducted on to the low-level land. The sewage is to be discharged from the tanks at a depth of 1ft. 6in. below the water level on to the first or rough set of filters, of which four are provided, covering an area of one acre. After remaining in these for the requisite period, it is passed on to the second and finer sets of filters, of the same number and area as the others, after which it is discharged by a glazed brick carrier into the effluent sewer. In addition to the tanks and filters, there will be ten acres of land filtration, and the scheme is so arranged as to utilise either of the methods of filtration or a combination of both.

Builders' Notes.

So great has been the expansion of the trade of Barrow since the acquisition of the naval construction works by Vickers, Sons, and Maxim, that 1000 additional houses are required for the workmen already employed, and for those who will be employed as soon as the extensions to the shipyard and engineering shops now in progress are completed. Builders in the town cannot keep pace with the demand for houses, and some bolder enterprise will be required soon to keep abreast of the demands of the position.

WE are informed that somewhat serious trouble has arisen in the building trade at Norwich in relation to the use of Broseley tiles, which the bricklayers considered should be laid by them. They have now struck, with the concurrence of the local branch of the Bricklayers' Union, against Mr. T. H. Yelf, contractor, who is building the new Jenny Lind Infirmary in Unthank's Road, and who engaged a firm of builders' merchants to tile the roofs. He has resisted the demands of the bricklayers, and if they do not accept arbitration the Master Builders' Association threaten a lock-out.

THE Nottingham Board of Guardians have accepted the tender of Mr. Frederick Evans, Old Basford, in £158,000, for the erection of a new workhouse at Bagthorpe, subject to the contract being completed in three years. The lowest of the tenders originally sent in was £274,500, which exceeded both the estimates of the Board's advisers, and the expenditure sanctioned by the Local Government Board. Accordingly, the Guardians called in their consulting architect, who suggested modifications of the scheme, whereby, without reducing the accommodation or sacrificing any material feature of the plans, a saving of at least £100,000 would be effected, and it is on this revised basis that the new tender has been accepted.

AN important step has been taken by the operatives in the engineering trade in Birmingham and district, who have adopted new rules embodying a rearrangement of the basis of overtime rates. The workmen claim that, in view of the rates prevailing in other large engineering centres, they are entitled to time and a quarter for the first two hours, and time and a half afterwards, and that, instead of excess being reckoned on a fifty-three hours week, it should be calculated from five each evening. Double time is demanded for Sunday. The Employers' Association has conferred upon the subject, but states that there is no neces-

sity for such alterations. The reply will be submitted to the men, and district members may elect to fight the employers if negotiations fail.

A SUSPENSION cableway, called a "Blondin" railway, has been fixed across the Thames at an altitude of some 70ft. for use in rebuilding the Vauxhall Bridge. Messrs. Pethick, of Plymouth, are the contractors, who are using it in the construction of the bridge, and the method of construction has been to fix a mast some 77ft. high on each side of the river, carrying the cable across with a span of about 930ft. The cable is 6½in. in circumference, with a breaking strain of 150 tons, and a truck suspended from it is capable of bearing a load of four tons. The car can travel at a rate of 400ft. per minute, and can be lowered to any level below the cable line. This cable does away with the extensive staging that would otherwise have had to be erected. Its cost has been £1,750.

THE federated building trades of Newport have notified the masters of their requirements on and after the 1st May next. In October last the Newport Master Builders' Association gave the workmen six months' notice as to certain alterations in the agreement subsisting between them; and now the men, having federated all workers engaged in the building trades, ask for an increased wage as follows:—Carpenters, plasterers, masons, and plumbers 9d. per hour; mason fixers, 9½d.; bricklayers, 8½d.; painters, 8d.; general labourers, 6d.; and scaffolders, drainers, and engine tenders, 6½d. per hour. The federation also demur to working with non-Unionists; hitherto society men and non-society men have worked amicably side by side. The masters require several alterations, some of which are the outcome of the prolonged strike of last spring and summer. The masters demur to the federation being able to call out their members by giving two hours' notice, and wish to obtain an extension of the conciliation idea, by which there shall be no suspension of labour pending the decision of the Conciliation Committee, which is composed jointly of masters and men. They also wish to enforce a schedule that the wages of the average skilled workman shall be 8d. per hour.

THE authorities of the Congo State are pushing forward the various railway schemes that are on foot. A large quantity of railway material for the Mayumbe Railway is now being sent and will be landed at Boma, whence the railway starts in the direction of the Chiloango River. The work is sufficiently advanced to permit of laying the rails immediately they arrive.

Trade and Craft.

MOSES EADON AND SONS.

We are informed that the London office of Messrs. Moses Eadon and Sons, of President Steel Works, Sheffield, formerly located at Bishopsgate House, E.C., has now been removed to 5 and 6, Bishopsgate Street Without, E.C. Messrs. Eadon and Sons are manufacturers of saws; plane, moulding, and tongueing irons; buckles, tillers, cotters, and gibs; cast and rolled steel for all purposes, and various tools.

ABBOTT BROTHERS.

Messrs. Abbott Brothers, Southall, Middlesex, have sixty different embossed wood mouldings regularly in stock. These artistic mouldings for internal decoration are made in walnut, oak, and American white wood, but those in oak only are stocked, the demand being almost exclusively for these; samples can be obtained free from the makers, or a set of samples will be sent for five shillings. Messrs. Abbott Brothers are also inventors and manufacturers of designs in various white wood goods, "Vulcan" pyrographic machines, poker work on glass and wood, &c.

J. DUCKETT AND SONS, LIMITED.

We have received from Messrs. J. Duckett and Sons, Ltd., Burnley, Lancashire, their illustrated catalogue of sanitary specialities. It provides a useful description of this firm's improved forms of slop-water closets, urinals, street gulleys, grease traps, disconnecting traps, &c. Their slop-water closets, which are flushed automatically by slop-water, are deservedly becoming very popular, especially after their sanction by the Local Government Board for outside use, as reported in our issue of September 21st, 1898. The advantages claimed for this closet, as compared with the clean-water closet, are:—That in the severest winter it is not liable to get out of order by freezing up; that there is a great saving of town's water, amounting often to at least three gallons of water per head per day, or probably 15 per cent. of water consumed, which to public bodies is of great importance; that where the slop water from a dwelling is collected and passed through the closet, the flushing of the closet will be on an average about four times per head per day; the house drain is regularly flushed; the cost of maintenance is reduced to a minimum, plumbers' bills being done away with absolutely; the prime cost is less; there is less liability to get out of order through rough usage; and the volume of sewage to be treated is less.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Jan. 20	Cwmaman, Aberdare, Wales—Thirty-five Cottages	Cwmneol Building Club	T. Roderick, Architect, Clifton-street, Aberdare.
" 21	Delph, Oldham—Erection of Premises	Industrial Co-operative Society Ltd.	Society's Office, Delph, Oldham.
" 21	Greasborough, near Rotherham—Villa Residence	J. Rawlin	J. Platts, Architect, Old Bank-buildings, Rotherham.
" 21	Leeds—Erection of Shoe Factory		S. E. Smith and J. Tweedale, 12, South-parade, Leeds.
" 21	Whitby—Alterations to Hotel		J. J. Milligan, 77, Baxter-gate, Whitby.
" 21	Dunoon, Scotland—Erection of Police Station		W. Fraser, Architect, Burgh Buildings, Dunoon.
" 23	Kingstown, Ireland—Laying-out Open Space	Commissioners	J. Donnelly, Town Clerk, Town Hall, Kingstown.
" 23	Bury, Lancs.—Supply of Retorts, Firebricks, &c.	Corporation	H. Simmonds, Gas Engineer, Gasworks, Bury.
" 23	Cheltenham—Reservoir Retaining Wall	Corporation	Borough Surveyor, Municipal Offices, Cheltenham.
" 23	Guide Bridge, Lancs.—Refreshment Rooms	Great Central Railway Co.	Engineer, London-road Station, Manchester.
" 23	Hengoed, Wales—Erection of School, &c.	Gelligaer County School Governors	James and Morgan, Charles-street-chambers, Cardiff.
" 23	Newtowncunningham, co. Donegal—Residence	Presbyterian Church Committee	M. A. Robinson, Architect, Richmond-street, Londonderry.
" 23	Rawtenstall, Lancs.—Five Cottages	R. Parker	F. J. Hobson, Architect, King-street, Rawtenstall.
" 24	Leeds—Repairs to Schools (Yearly Contract)	Leeds School Board	W. Packer, Clerk, School Board Offices, Leeds.
" 24	Leeds—Supply of Retorts, &c.	Gas Committee	R. H. Townsley, General Manager, Gasworks, Leeds.
" 24	Croydon—Additions to Laundry, &c.	Union Guardians	F. West, 23, Coombe-road, Croydon.
" 25	Blackpool—Alterations to Station Buildings	Laucs. & Yorks. & L.N.W. Joint Rlys.	Engineer, Hunt's Bank, Manchester.
" 25	Porth, Wales—Hotel Alterations, &c.	T. Davies	A. O. Evans, Architect, Pontypridd.
" 25	Stalybridge—Post Office	Commissioners H.M. Works	Offices, Storey's-gate, Westminster.
" 25	Cranbrook—Boiler House, &c.	Union Guardians	The Master, Workhouse, Cranbrook, Kent.
" 25	London, N.—Pulling-down Buildings, &c.	Islington Vestry	J. P. Barber, Vestry Hall, Upper-street, N.
" 25	Isle-of-Thames—Cottage Home Buildings	Union	L. Grant, High-street, Sittingbourne.
" 25	Little Ilford—School Buildings, &c.	School Board	S. Jackson, 65, Fenchurch-street, E.C.

Property and Land Sales.

PERIODICAL SALES.

ESTABLISHED 1843.

MESSRS. H. E. FOSTER & CRANFIELD (successors to Marsh, Miller, and Co.) conduct PERIODICAL SALES of

REVERSIONS (Absolute and Contingent), LIFE INTERESTS AND ANNUITIES, LIFE POLICIES, Shares and Debentures, Mortgage Debts and Bonds, and Kindred Interests,

on the FIRST and THIRD THURSDAYS in each month throughout the year, at the MART, Tokenhouse-yard, E.C. Remaining date for 1898:— December 15th.

The following are the appointments fixed for 1899:—

January 19th	May 18th	September 21st
February 2nd	June 1st	October 5th
February 16th	June 15th	October 19th
March 2nd	July 6th	November 2nd
March 16th	July 20th	November 16th
April 6th	August 3rd	December 7th
April 20th	August 17th	December 21st
May 4th	September 7th	

Offices, 6, Poultry, London, E.C. Telephone No. 999 Bank.

SURREY.—Choice BUILDING ESTATE. —In a charming district, two miles from Horley station (L.B. and S.C. Rly.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church.

FOR SALE, a compact and valuable FREEHOLD PROPERTY of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Prettily timbered. Gas and water mains along the frontage. Would be divided.

Plans and full particulars of the owner's agents, Messrs. GREEN and SIMES, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W.; or Mr. W. M. LEACH, Auctioneer and Estate Agent, Crawley, Sussex.

FAIRMILE PARK, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

MESSRS. DRIVER and CO. have received instructions to offer to AUCTION at the MART, Tokenhouse-yard, Lothbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of CHARLES JUPP, Esq., Solicitor, 48, Lime-street, E.C.; and of Messrs. DRIVER and Co., 23, Pall Mall, S.W.

By order of Trustees.—Preliminary Advertisement.—Freehold Building Estate, Streatham, near West Norwood Railway Station.

MESSRS. FIELD and SONS, and Messrs. WOLFORD and WILSHIN, who are jointly concerned, will SELL by AUCTION, at the MART, at an early date, a valuable FREEHOLD BUILDING ESTATE, known as High View Park, comprising 16a. 1r. 10p., lying immediately at the rear of and with approach from Leigham Court-road; also a contiguous Freehold Building Site of 2a. and 5p. in a new road intended to connect Canterbury-grove with Thurlby-road.

Particulars and plan, in due course, of Messrs. KINGSFORD, DORMAN, and Co., Solicitors, 23, Essex-street, Strand; of Messrs. WOLFORD and WILSHIN, Auctioneers, Anerley, S.E.; and of Messrs. FIELD and SONS, as above.

LEA VALLEY, PONDERS END, and BROXBORNE.—Freehold Wharf and Building Land, the latter with possession, some of which has been included in the schedule of the land required by the East London Waterworks Company.

MESSRS. NORTON, TRIST, and GILBERT will SELL by AUCTION, at the MART, Tokenhouse-yard, London, E.C., on TUESDAY, FEBRUARY, 28th, 1899.

LOT 1.—8 acres 0 roods 11 perches of Land, with a frontage of 500ft. to the Lea and Stort Navigation Canal, also bounded on the north and east sides by the stream. This land is situate immediately opposite the Corticine Floor Covering Works, Ponders End, and is a fine site for the erection of a factory requiring waterside accommodation. It is in the occupation of Mr. Ives. This land has been scheduled to be acquired for the New Reservoir for which the East London Waterworks Company are applying for Parliamentary powers.

LOT 2.—14½ Acres of Freehold Building Land, with a frontage of 1080ft. to the road, close to Dobbs Weir, and within one and a half miles of Broxbourne Town and Station, now ripe for building purposes, possession of which can be given on completion of the purchase.

Particulars and conditions of Sale may be obtained from the Senior Official Receiver in Bankruptcy; of Messrs. CLARKE, RAWLINS, and Co., 66, Gresham House, London, E.C.; at the MART; and of the AUCTIONEERS, 70, Queen-street, Cheapside, London, E.C.

To Land Syndicates, Building Societies, Capitalists, and others.

PINNER.—Important Freehold Building Estate of over 47 acres, with residence, known as Barrow Point, occupying a beautiful position close to the quaint old village of Pinner, within five minutes from the railway station on the Metropolitan line, and extending to within about ¾ of a mile of Pinner Station on the London and North-Western Railway, having easy access from the West-end and City. The whole ripe for immediate building operations, and admirably adapted for villa residences of a superior class.

MESSRS. FAREBROTHER, ELLIS, MEGERTON, BREACH, GALSWORTHY, and CO. beg to announce that the above valuable PROPERTY, which they recently offered for Sale by Auction, may now be treated for privately.

No. 29, Fleet Street, Temple Bar, and 18, Old Broad Street, E.C.

LEYTON.—Valuable FREEHOLD BUILDING LAND, in well-developed and improving neighbourhood, 120ft. frontage to Tyndall-road; depth, 90ft. Choice site for eight medium-sized houses; ready for building operations. Roads sewered and made by Urban District Council. Solicitor, C. G. Hobbs, Esq., Portland-chambers, 93, Great Titchfield-street, W.

By order of Mortgagees.—At a low reserve. HASTINGS, Sussex.—Nos. 36, 38, and 40, Braybrooke-road. In three lots. Conveniently planned RESIDENCES in a capital position, held for seventy-two years at low ground-rents, and producing £35 per annum each. Solicitors, Charles Balcombe, Esq., Ticehurst, Sussex; and C. G. Hobbs, Esq., as above. Local Auctioneer, W. N. Oldham, Esq., 6, Havelock-road, Hastings.

HENRY CHAPMAN and CO. will SELL the above by AUCTION at the MART, Tokenhouse-yard, E.C., on WEDNESDAY, FEBRUARY 1st, 1899, at TWO o'clock.—Auction Offices, De Vere House, 2, Southampton-street, Strand.

R. I.B.A. EXAMS. MR. W. CHURCH HOWGATE hereby announces that he has taken MR. ALEXANDER G. BOND, B.A. Oxon., A.R.I.B.A., into PARTNERSHIP, and that in future all applications should be made to MESSRS. HOWGATE and BOND.

R. I.B.A. EXAMS. PREPARATION, personally or by correspondence, in three, six, nine, or twelve months' courses. Architectural Lending Library. Special three months' finishing courses.—For full particulars apply to Messrs. HOWGATE and BOND, Associates R.I.B.A., Perchard House, 70, Gower-street, W.C. (close to the British Museum

R. I.B.A., SOCIETY OF ARCHITECTS, and R. CIVIL SERVICE TECHNICAL EXAMINATIONS. Preparation by correspondence, in residence, or personally.—MIDDLETON and GARDEN, 19, Craven-street, Strand, W.C.

PREPARATION for R.I.B.A. by correspondence.—Papers personally corrected; special terms for June and November Exams.—"Architect," 7, London-road, St. Albans.

PERSPECTIVES. E. BECKITT LAMB, 31, Craven-street, Charing Cross, W.C.

WANTED, GALVANISED IRON SHED, must be in good condition; strong gauge sheets; area 2000 to 3000 square feet; must be well lighted, and fitted with suitable doors; height about 2ft. 6in. to eaves.—State price on rails Horwich, also amount extra for erecting, A. HASON and Sons, Horwich.

HANDRAILS, STAIRCASES, and general joinery by experienced hands.—Apply C. B. DAWE, 85, Hatherly-road, Walthamstow.

APPOINTMENTS VACANT.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

ORDER and Correspondent CLERK WANTED.—One with a knowledge of book-keeping and Building or Engineering Trades preferred.—Apply, stating salary required, experience, age, &c., "Box 941," BUILDERS' JOURNAL Office.

APPOINTMENTS WANTED.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two.

YOUNG ARCHITECT, A.R.I.B.A., ASSISTS in the PREPARATION of DRAWINGS, TRACINGS, &c., at his own Office. G. SCORER, 28, Newman-street, W.

ADVERTISER, having spare time, prepares plans, designs, details, specifications, surveys, &c., for all building purposes at moderate charges.—J., care of Mr. Burr, 65, Chancery-lane, W.C.

TO Builders, Decorators, Sanitary Engineers, &c. Evening assistance by contractor's assistant. Accounts, estimates. Expert sanitary reports and details. Good general draughtsman. Terms moderate.—Apply Box 932, BUILDERS' JOURNAL Office.

BRICKLAYER (jobbing, good in plastering drains, slating, tiling, &c.) wants CONSTANT JOB.—Address, HARMER, 18, Bracklyn-street, New North-road, N.

CLERK of WORKS.—Thoroughly reliable Man seeks POSITION as above on stone job or estate. Excellent testimonials. Fourteen years' reference.—E. G. THORNTON, Milton, Chipping Norton, Oxon.

An Architectural Causerie.

The Architecture of Our Railway Stations.

A DAILY contemporary, in referring to the Marylebone Terminus of the Great Central Railway, now approaching completion, speaks of the buildings as being "pretty," and goes on to say that prettiness is not so much the quality to be looked for in a great terminus as dignity and impressiveness. For a daily paper this is indeed wonderful insight as to matters architectural. We are not used to criticism of so enlightened a kind proceeding from the non-technical Press, and are correspondingly surprised and gratified. When it spoke for "dignity and impressiveness," our contemporary was doubtless referring to Euston and its Doric propylæum, designed and built by Hardwicke for the London and Birmingham Railway (as the London and North-Western was then named), over sixty years ago, at a cost of £50,000. That sombre portal certainly fills both conditions, although, for our own part, we must needs confess that, apart from its architectural merits, it has a depressing influence which it does not seem to be good business on the part of a railway company to encourage. It bears—despite its dignity—too much of the gloom of the mausoleum, to which bourn a railway should not be presumed to lead. Apart, however, from the forbidding character of this grand entrance to Euston Station, it is interesting to note that in the beginnings of railways it was so deeply thought that they should be embellished with Architecture that the huge sum of £50,000 was spent for no directly useful purpose at this one particular spot. The idea was as short-lived as this instance of its working was extravagant, and since that day our railway stations have been built with a single eye to business and the welfare of the shareholders, and have almost without exception, been neither pretty nor dignified. The sole exceptions we can instance are the great Midland terminus at St. Pancras, the impressive interior of York station, and the handsome bays of the Great Western's terminus at Paddington. St. Pancras, with its grand pointed arch of iron and glass, enclosing with one comprehensive sweep the whole of the station, and with its noble Gothic façade by Sir Gilbert Scott fronting the otherwise architecturally sterile neighbourhood of King's Cross, is, of course, the most prominent of these examples, and one which we could well urge the other companies to live up to. Only it is to be feared that St. Pancras was a heroic enterprise which no other railway is either courageous enough or public-spirited enough to emulate. As for stations that are not termini, their case is beyond cure, and to the end of the railway era we shall doubtless have to endure such entirely hideous and uncomfortable stations as those common enough (and more than common enough) in London. Some years ago the enterprising conductor of one of the "snippets" papers started a competition to determine which was the ugliest and most disgraceful station in London. Every Londoner has his pet aversion, but the prime favourite and ulti-

mate prize-winner in this race was Wormwood Scrubbs. You may look vainly for that name now, for the Company concerned with that dismal station has re-christened it "St. Quentin Park." Under that flamboyant title, however, it is still the same old structure, coopered together out of ancient and derelict packing-cases and egg-chests. This is but the foremost example of a numerous type. They manage things better on the Continent, where such stations as the Nord, at Paris, and the fine elevation of that at Frankfort, are but examples of

The Influence of Material on Architecture.*

It is with a certain nervousness that one ventures to discuss this essay. It has received the approval of the Royal Institute of British Architects, both as to its subject matter and its literary style. But as the author has chosen to appeal to a wider circle, this wider circle will doubtless judge him by its own standard. The influence of material on Architecture is a fascinating

THE VOTIVE CHURCH, VIENNA.

numerous instances to set against such crimes as our Charing Cross, Cannon Street, Waterloo, or London Bridge. Some day, perhaps, when we obtain that long-dreamt-of central interchange station for London, which it was proposed by an enthusiastic member of the Institute of Civil Engineers thirty years ago to build somewhere in the neighbourhood of Farringdon Street station, we shall wipe away the reproach, but when that scheme shall emerge from the realms of dreamland none can tell. C. G. H.

theme; to write an essay on it, within given limits, is no light task: there is ample scope for the display of literary ability in selection and compression. The author takes up the position that "Architecture is an affair of material." Quite so! but it is also an affair of climate, and other determining influences. Life, says the philosopher, is the outcome of power and circumstance. So is Architecture.

* "The Influence of Material on Architecture." By Banister F. Fletcher. London: B. T. Batsford.

To form any just estimate, to draw any definite conclusions, we must take into account the whole of the circumstances, and give each one its relative value. The material is but one of the many circumstances that influence the form in which the power embodies itself. Its importance must not be over-rated. Although it is evident that the various styles of Architecture could not have taken the forms they did unless suitable material had been to hand—material capable of being used in the way the artist wished to use it; yet it must not be forgotten that the arrangements were suggested by the physical and mental needs and the spiritual aspirations of the people, and only modified by climate, conditions of labour, and the limits imposed by the nature of available material. In any branch of human endeavour, the human spirit is, after all, the dominating factor. Man may be the creature of circumstance, but he is none the less master of his fate. In circumstances where but one material is to be had with which to build, that he must use, or none at all; but in circumstances where there is a choice—and these are the usual circumstances—he is free to choose, and he has chosen. And again, when he has chosen the material, it is still capable of being used in various ways, dictated by the characteristic genius of the people. It is not to be supposed that the Greeks developed their style, and built as they did, under compulsion of the material. There were other materials in Greece than the marbles of Pentelicos; and, having chosen as they did, they would have treated the material differently had their national genius been other than it was. In the same way the builders of the twelfth century in England did not use small stones because they could not get large ones; they used them because the effects obtainable by their use were in accord with their ideas, and for reasons connected with labour and mechanical appliances. Throughout all the genius of the people was the ruling factor. In treating of the work of the Romans the author seems to recognise this, and points out how the official Architecture of the empire was imposed on the subject races precisely as was the Roman law, and other adjuncts of their civilisation. He shows, also, how the Romans, in adopting the use of concrete, broke up for this purpose stones of all description and of varying characteristic qualities; but he omits to draw the inference that the local materials had little or no influence on the Architecture; and he hardly emphasises sufficiently the fact that the official regulations rode roughshod over the peculiarities and properties of the local materials, and made no more concession to them than the Roman law made to those of the people. Imperial Roman Architecture was not an affair of material, it was an affair of State. In dealing with the Architecture of the Renaissance, the author admits that material had little to do with the matter, and suggests the reflection that it was all the worse for the Architecture. The fact is that in taking up the position that Architecture is an affair of material, it seems that he attempts, as it were, to prove too much, to defend an untenable position; and, as if he unconsciously felt the weakness of this position, he appears to involuntarily shift his ground somewhat into proving that the merit of Architecture varies as the logical treatment of material, which is not exactly the question he set out to discuss. Would not a truer conception of the influence of material have been obtained by considering it more in the light of a limiting influence to man's aspirations? as an influence which keeps the artist's feet firmly planted on solid earth, although his head may be in the clouds and his imagination storming at the gates of heaven? The author's thesis is a half-truth; true enough for an epigram, but not for an essay.

A. R. J.

On Reflection.

The R.I.A. of Ireland.

Council of the Royal Institute of Architects in Ireland, whereby a popular feeling that an infusion of the enterprise and energy of the younger members of the Profession would benefit the general usefulness and welfare of the Institute, has effected the election of four gentlemen from the ranks of the junior practitioners. It has for a long time past been the custom of the Council to nominate its own members who, as a matter of course, have been re-elected year after year somewhat to the detriment of the usefulness of the Institute. The personnel of the Council has thus remained materially unchanged for the last twenty-five years but for the vacancies caused by death among its members. This has induced a somewhat lethargic attitude towards that "Advancement of Architecture" which was the avowed object of its constitution. The Institute meets but once a year, and has done little or nothing to supply the great need that has existed in Dublin for assisting or directing the studies of young architects; and it has been left to the Architectural Association of Ireland to supply the Architectural classes, and provide opportunities for the professional education of would-be architects in the city. Dublin is distinguished by much fine Architecture, dating particularly from the end of the eighteenth century, and has examples of some of Sir William Chambers' best work; and it is a pity that this high standard of taste, which the city exemplifies, should be permitted to decay for lack of proper opportunities for the education of its coming architects. Among the members newly elected to the council of the Institute are the President and two members of the Architectural Association, and we hope that they will be able to arouse in the elder body some such enthusiasm and enterprise as characterises the younger Association.

The Bradford Competition.

THE competition for the Cartwright Memorial Hall and Art Gallery at Bradford promises to be one of the most important and satisfactory of the year. The presidents of the R.A. and the R.I.B.A. who were asked to name an assessor to "assist the Corporation in their selection," nominated Mr. Alfred Waterhouse, R.A. The building is to cost no more than £40,000, and, as is usual, the requirement seems to be on a more magnificent scale than the funds. The "conditions" on the whole, however, are satisfactory. It is stated, with emphasis, that the authors of all designs submitted otherwise than in accordance with the regulations are to be disqualified, and the Corporation reserves the right to withdraw the premium if the tenders for executing the selected designs should amount to a greater sum than £38,000. We notice what we believe to be an innovation in the framing of the clause dealing with the rules by which anonymity is to be preserved. No motto or distinguishing mark is to be attached to the several designs by their authors, but each set is to be forwarded in a case which is also to contain a blank sealed envelope giving the usual particulars of authorship. The drawings and envelopes will be privately marked by the officials when the cases are opened. We do not see what particular end is served by this exceptional precaution to secure anonymity. It will not prevent any possible favouritism on the part of the Corporation, for the character of each design affords a sufficiently distinctive mark for identification; and the mottoes are a great convenience to the competitors, their friends and the

members of the Profession generally, who take a lively interest in the exhibition of the designs, and in the reports thereon.

Tavistock Road (Plymouth) Competition.

WE had occasion some weeks ago to refer to this competition. Though the drawings were sent in on September 24th, the terms of the conditions were of such a nature that the Plymouth Corporation has up to this been unable to secure the services of a reputable architect to act as assessor. Although, as we understand, the post has already been declined by one fellow of the R.I.B.A., we learn that another, Mr. Sidney R. J. Smith, has now stepped into the breach. We have no doubt he will do his best to bring the matter to a satisfactory issue, but it is stated that in Plymouth the dissatisfaction at the conduct of the Corporation has been so strong that the competition has been put under a taboo by local architects. This action indicates a spirit of independence which we are accustomed to look for in vain among architects where a competition is concerned. We hope that Mr. Smith will not be induced to lend himself to any procedure which may discredit the reasonable objections of his brother architects.

Ballintubber Abbey.

SOME few weeks ago we referred to Clonfert Cathedral which is in course of restoration, and an article which lately appeared in the Morning Post has called our attention to another interesting mediæval ecclesiastic relic in Ireland, which deserves the solicitude of those who are concerned for the protection of ancient buildings. Ballintubber Abbey has a cruciform plan with four side chapels opening from the transepts. Its extreme dimensions north and south are 75ft., and east and west 132ft. The original building dates from 1216, and is in the characteristic Hiberno-Romanesque style which the late Edmund Street sought to reproduce in his restoration of Christ Church Cathedral, Dublin. A fire in 1263 destroyed most of the earlier building, and the entire church has long been a complete ruin. The Morning Post writer tells us that for over 300 years, week after week, the neighbouring Roman Catholics have religiously gone through the celebration of Mass in all weathers, protected only by the four ruined walls of the Abbey church. There have been several attempts at restoration during the present century, and a roof was, ten years ago, built over the chancel and transepts, chiefly designed for the utilitarian purpose of protecting the interior from further decay and the congregations from the stress of weather. An attempt is now being made to secure further and complete restoration by re-roofing the entire church, repairing and glazing the windows, groining the spaces between the great arches of the crossing in stone, and excavating and clearing the ground round the building to its original level. Subscriptions to this end will be received by Miss Fitzgerald Kenny, of Clogher House, Ballyglass, County Mayo.

THE entrance to the lower chamber in the Central Lobby of the Houses of Parliament is at present occupied with scaffolding, a number of workmen being engaged in placing an elaborate mosaic, representing St. David, in the niche over the doorway. The mosaic is to be a companion work to that depicting St. George, over the entrance to the House of Lords, and it is intended to place mosaics representing the patron Saints of Scotland and Ireland in the corresponding spaces over the doorways leading to St. Stephen's Hall and to the Commons' dining-room and committee-rooms. The David mosaic will be in place before the opening of Parliament. The work is in the hands of a foreign firm.

DOORWAY IN GREAT TITCHFIELD STREET.

LONDON DOORWAYS.

BY RUPERT C. AUSTIN, A.R.I.B.A.

I HAVE often thought that while much is written about old work and its beauties, our modern work is either wholly neglected or else done scant justice to by perspective draughtsmen, whose drawings are completed before the work is built, and so must necessarily be lacking in local charm. It has been my aim to reproduce some of our London doorways which, either in general treatment or detail, call for special remark.

No. 8, Great George Street, S.W., illustrates a typical London residential house, with the usual flight of steps from the street; but there similarity ceases. It is true there is a plain, semicircular, 9in. arch, but within the arch how cleverly the detail is schemed! The door is a stout ten-panelled one, very simply treated. On the right is a small octagonal attached column with base, and cape enriched with echinus which supports a stone lintel decorated with a most delicate ornament evidently based upon the Assyrian wave. The door does not occupy the whole width of the archway, but leaves room between the column and the jamb for a small window protected by a gilded iron grille, which, owing to the effect of the London atmosphere, has toned down to a pleasant colour.

The tympanum is glazed, and subdivided near the top by a wood moulded cornice supported on balusters of the same material, which divide it equally into three parts. The middle one contains an octagonal glazed lantern. The whole of the glass in the tympanum is protected by an iron grille of a

most original pattern, and also gilt. The great charm of this entrance lies in its simplicity, but it should be seen to be thoroughly appreciated. I believe the house was designed by Mr. Leonard Stokes.

The entrance to All Souls Church Home, Great Titchfield Street, is, I believe, an addition. Certainly the doorway differs in a marked degree from the surrounding work, which is plain in the extreme. Here is exactly the opposite of 8, Great George Street, although both doors have fanlights over them. Saturday afternoon presents a lively scene in Great Titchfield Street, with its rows of costers' barrows, the owners of which loudly proclaim the merits of their respective wares; while above the Guardian Angels look down upon the hurrying throng of humanity. It was a stroke of inspiration which conceived such an entrance as this in such a street.

In conclusion, I have only to draw attention to the charming detail in the architrave. Drill holes are used here with great effect to emphasise the shadows in the carving; the remainder of the doorway speaks for itself. Stone is used throughout; the surroundings only are of stock brick. I do not know who designed this work; no doubt some reader can furnish the information.

THE VOTIVE CHURCH IN VIENNA.

BY A. DE BURGH.

AMONG the many great monuments erected during this century to the memory of sovereigns, princes, church-dignitaries, statesmen, soldiers, poets and authors, painters and composers, philanthropists or other great and renowned men and women, or to commemorate important events, there is little doubt the finest and most costly is that perfection of a Gothic building in Vienna, the Votive Church, built by popular subscription as a token of gratitude for the escape of the Emperor Francis Joseph of Austria from the assassin's knife on the 18th of February, 1853.

A short history of the attempt upon the life of the sovereign will be the more interesting in view of the tragic fate of the Empress and the fact that the venerable monarch himself has lately celebrated his jubilee. This was the sole attempt during his long reign. Accompanied only by one of his equeuries (a gentleman of Irish descent, Count O'Donnell), the young Emperor, wearing a General's uniform, was taking one morning a promenade on the esplanade, formed by the flat top of the then existing city walls, which have since been razed to the ground. He was suddenly attacked by a man, who, raising a knife, thrust it into the Emperor's neck from behind, while he was looking down over the wall. The buillion lace of the uniform collar broke the force of the stab, and Count O'Donnell and a private citizen, who happened to pass by, overpowered the fanatical would-be regicide, the Count sucking the wound to prevent any possible poison on the dagger from taking effect. The Monarch returned to the Imperial Castle in a carriage which was at once procured. The wound, though deep and painful, did not prove fatal, and indescribable was the joy and thankfulness of the Austrians over the escape (which was indeed a narrow one) of their beloved youthful sovereign.

The Archduke Ferdinand Max, afterwards Emperor of Mexico, a younger brother of Francis Joseph, took the initiative for

the erection of some suitable memorial which should for ever commemorate the gratitude of the people; and after many consultations with prominent men in all stations of life it was decided to build a church. Nearly £120,000 were collected upon the first issue of an appeal for funds, and architects throughout the world were invited to send plans. The task of selection was left to King Ludwig I. of Bavaria, a man of great taste and a lover of everything beautiful. His choice fell upon the plan of Henry Ferstel, and on April 24th, 1856, the first stone was laid. Twenty-three years afterwards, on the twenty-fifth anniversary of the marriage of the Emperor and Empress, the church was solemnly consecrated and used for the first time for public worship.

The cost of the whole building has been very great, but there was never any difficulty in raising the necessary funds, either for the successful completion of the exterior or for the ornamentation of the interior, which is in every detail in keeping with the pure Gothic style of the entire structure. It is perhaps no exaggeration if we say that the Votiv-Kirche is the most perfect example of modern Gothic architecture, not even excepting such works as the Duomo of Milan, or La Chapelle in Paris.

The ground plan of the church consists of a long nave, divided longitudinally by high columns into three aisles with seven side-chancels, ending in a raised chancel. A transept runs at right angles through the edifice, giving the ground plan the shape of a cross. The principal façade, with the great ornamental door, is flanked by two towers, with spires of most graceful and delicate marble fretwork, and there is a third and lower spire situated upon the roof at the central juncture of the nave and transept.

The space covered by the building is 3380 square metres, the nave is 95 metres long by 28.5 wide, of which 11.3 are occupied by the centre aisle, whereas the other two running parallel, and divided from it by columns, have the exact width of the towers. The transept has a width of 48 metres. The front façade is 36 metres wide; the towers, with spires, have a height of 95 metres, the same as the whole length of the church. It will be seen by these figures that the proportions are well preserved.

The nave supports its roof by five pairs of

DOORWAY AT 8, GREAT GEORGE STREET.

WROUGHT IRON BALUSTRADE, ROTHENBURG. FROM WALTER CRANE'S
"BASES OF DESIGN."

columns up to where it meets the transept, after this two more pairs of columns support the roof as far as the chancel. The chancel itself, which contains the high altar and various smaller chapels, is part of a regular twelve-sided figure, of which seven sides are actually existing and five are absent, forming the opening of the nave into the chancel.

The stonemasons' work is perfect in every detail, in true Gothic style, and speaks well for this particular handicraft.

The grand façade is adorned with a great number of figures in marble representing prophets and holy fathers of the Church. The illustrations accompanying this article will demonstrate better than words the beauty and magnificence of the edifice.

The interior is in perfect keeping with the exterior. The whole of the church owes its existence to the beneficence and liberality of the subjects of Francis Joseph, and it is especially significant that persons in every condition of life, of every nationality, and every creed, have equally contributed towards this truly noble memorial. Amongst the most exquisite and noticeable objects in the church are the painted and stained windows. The two gigantic windows (north and south) especially are master-works of the art; one is the gift of the Emperor and the other was presented by the Vienna Town Council. All the glass paintings on the windows have been executed by the late well-known painter, Geyling, after sketches by renowned artists. The rose windows cause remarkable light effects. The walls are embellished by frescoes (by the late Karl Schönbrenner) and the coat of arms of all the various provinces over which the Austrian monarch reigns occupy prominent positions among them.

Among the innumerable interesting works of art the church contains is the ancient tombstone of Count Niklas Salm, who died the death of a hero in the defence of Vienna against the Turks in 1529. This memorial was erected in 1580 by the Emperor Charles V. in the Church of St. Dorothy; but the building was converted into a public office and the tombstone was handed to the now princely family of Salm. It is now re-erected in the Votive Church. It is of light grey marble, and in the shape of a sarcophagus on which the gallant general is represented in full armour kneeling before a crucifix. The tomb is also ornamented with bas-reliefs of twelve battles in which the venerable military leader had participated, and with twelve medallions con-

taining portraits of contemporary men of renown, amongst them Emperors Frederick IV., Max I., Karl V., Ferdinand I., &c.

The position the Votiv-Kirche occupies near the Ring-Strasse is a very favourable one, and allows it to be well seen from all sides, and although it is surrounded by large palaces and other buildings, there is nothing which obscures any part of it. Our illustrations, on p. 385 and in the centre plate, give some idea of the beauty of this fine edifice.

THE BASES OF DESIGN.

A LECTURER may aim at two objects; one, to instruct, the other to impress his hearers, though, of course, the two may be combined. In hearing these lectures of Mr. Crane's the audience must have been enormously impressed with the encyclopædic knowledge of the lecturer, probably gained a good deal of information, and certainly must have enjoyed and admired the many beautiful examples of applied art, exhibited by means of photographs and very effective diagrams; but it may be doubted whether he was well advised to publish them with so little revision. The language is frequently slipshod and jerky, and badly punctuated sentences disfigure and veil the author's meaning. These defects which would not be observable in a lecture, when the mind is intent upon following the sentences as they drop from the speaker's lips, and there is no opportunity to look back a little way and see whether, for instance, the sentence really terminated with that full stop, or whether the sense went on past two or three others, to all appearance scattered haphazard over the page. The book is copiously illustrated with the most delightful examples of many styles and forms of design, selected with good taste, and well reproduced for the most part, and for that reason, if for no other, it should be a desirable possession. Of these designs a few may be mentioned as being particularly striking: the beautiful Persian carpets on pp. 107 and 171; Mr. Crane's own wall paper designs and drawings for pages of books, and the lovely carved stone lattice from the Mosque of the Palace at Ahmedabad. Also the French Gothic sculptures on pp. 262-5, and the woodcuts of plants a little further on, together with the Italian Renaissance pictures and sculpture.

The planning of the book is good and pretty complete. Commencing rightly with the Architectural basis, it proceeds to the influence

* "The Bases of Design," by Walter Crane. Price 19s. London: G. Bell and Sons.

PORCH OF CATHEDRAL OF S. JACOPO, PISTOIA. DRAWN BY WALTER CRANE.

of conditions of utility, material, and method before treating of less vital influences, such as those of climates, race, symbolism, naturalism, and individuality, and terminates with a chapter on the collective influence in design, which treats of complex forms of Art workmanship in which many crafts combine to produce the final result. This concludes with a paragraph which deserves to be written up in letters of gold in every workshop in the kingdom: "Strive, each in his sphere, whatever our main work may be, to do it worthily and well, remembering that it is better to do a small thing well than a big thing badly, and that it is the spirit in which our work is done, not the place it may accidentally occupy, or the class to which it may belong, or the reward it may receive in the ordinary estimation, that makes it great or little." And in the same chapter occur these sentences: "Art, however, is only concerned with quality—to make everything as good of its kind as possible, to seek variety, beauty, appropriateness." "Mechanical perfection is one thing, and artistic feeling quite another, and the more as an end a people seeks after the first the less it is likely to care for or understand the other," which show the point of view from which Mr. Crane approaches the question of design for manufactures.

Throughout the book he speaks as the decorator, and may be thought to rather overmagnify his art. The strongest instance of this is in the first chapter, where on page 26 he ascribes the "birth of the pointed arch" to the interlacing of circular arches in a decorative arcading. This is much on a level with the opinion of one's childhood which ascribed the vaulted Gothic Cathedrals to an imitation of the branching lines of avenues of trees, the real fact being, of course, that it was born from the necessities of construction. When the architects of the 12th century desired to vault a cruciform building, the vault being semi-circular, the diagonal section of the crossing showed a flatter curve which they found not stable, therefore the diagonal section was made circular. But this entailed raising the crown of the narrower arches to the same height if the vaulting surfaces were to be kept simple, and the easiest way of doing it was to make them pointed, the diagonal section of one form of pointed vault being semi-circular; and when it was found that this form was also stronger it became generally adopted, the principle of equilibrium by the balance of opposing forces supplanting the ancient Roman principle of the individual stability of each unit of construction. In speaking of the decoration of construction, in Chapter I. Mr. Crane calls attention to the early habit of decorating the spaces between the skeleton. Either decorate construction, or leave it bare, applying decoration to the spaces which might be removed without endangering its stability, is a good rule to follow. If it is applied to both indiscriminately the effect is generally bad—confused and overloaded. In every form of design the proportioning of the voids and the solids, the spacing and contrast of massiveness and delicacy is the greatest difficulty the designer has to overcome, and some training in architecture would be of the greatest value to designers in every branch of the art, on account of the realisation of the great importance of consideration of utility and the necessities of construction forced upon them by that study. It is a curious fact that the proportion which satisfies the eye is always stable, though stability may frequently be secured with an unsatisfactory proportion.

The subjects of pottery, metal work, textile fabrics, stained glass, and printed material, both textile and paper, are treated of from various points of view, following the suggestion of the chapter headings, but throughout, the individuality of the author is apparent, the special, personal point of view, which is that of the craftsman as much as the designer. "Directly," he says, "from a false idea of refinement, or with the object of displaying mechanical skill, the craftsman is induced to try and conceal the fundamental conditions of his craft, and tries to make it ape the qualities of some totally different sort of work, he ceases to be an artist, at all events. The true

artist in any material is he who, in acknowledging its conditions and limitations, finds in them sources and opportunities of new beauty, and, in being faithful to those conditions, makes them subserve his invention." And in another place he says, "The production of things of beauty for ordinary use has declined with the gradual separation of artist and craftsman. Decoration, or ornament, we have been too much accustomed to consider as an accidental and unrelated addition to an object, not as an essential expression and organic part of it. The more we are able to keep before our minds the place and purpose of any design we have to make, the more we realise the conditions of use and service of which it must be a part, as well as the capacities of the material of which it is to be made; and the more we understand its constructive necessities, the more successful our design is likely to be, and the nearer

public requires books for purposes of amusement and instruction. It is hard to say to a whole class of art workers "the power of representing natural objects which you have cultivated with so much care is entirely beside the mark—quite misdirected energy." Is there no merit in Bewick's birds—or in Mr. Timothy Cole's woodcuts from the old masters, or in Mr. Lodge's charming natural history transcripts? Yet these must all be condemned if Mr. Crane's canon be accepted. The truth is that for certain purposes certain processes are best, and, as his own example shows in this book, and, as he acknowledges in his preface, there are other purposes which are better served in other ways than that he considers ideal. The chapter on the Graphic Influence includes in its early sentences an admirable dictum on the difference between naturalistic and decorative drawing. "The main difference seems to be that in purely graphic or natural-

CORBEL (FOURTEENTH CENTURY), DENNINGTON CHURCH, SUFFOLK.
FROM WALTER CRANE'S "BASES OF DESIGN."

we shall approach to bridging the unfortunate gulf which too often exists between the designer and the craftsman." Such sentences as these show how keenly Mr. Crane realises the importance of there being the closest union between the designer and craftsman—an ideal which seems far from realisation at present, though in a few crafts in which the trades unions are not quite all powerful it may not be past praying for.

The personal bias also shows very strongly in the sections on book illustration and black and white drawing. Mr. Crane's opinions are well known, and his own work and that of those who hold the same creed is before the public. There is no doubt that much of it is excellent, and has appealed to the taste of a large portion of that public most successfully. But surely this art is not so much less elastic than others that there is but one mode in it which is admirable? The principal object of a book is not always to look consistent and harmonious—some sometimes wants to read it; in fact, the number of sumptuous books produced for the bibliophile must always be small, while the mass of the

istic drawing individual characteristics or differences are sought for, while in ornamental or decorative drawing typical forms or correspondences are sought for," which, if kept in mind, would prevent the writing of a great deal of the nonsense which is poured out as criticism on pictures, the aim of which is decorative. Commencing with the cavemen's incised outlines, this chapter carries us down to the most modern black and white work, mentioning on the way Japanese woodcuts, Greek, Egyptian, and Gothic sculpture, the Grimani breviary, Dürer's woodcuts and copperplates, and monumental brasses. This will serve as an example of the wide range traversed by each chapter. In the next, on the Individual Influence in design, some of the more prominent and influential of the Italian painters and sculptors, Mediæval and Renaissance, are treated of—Giotto, Orcagna, Niccolò Pisano, Benozzo Gozzoli, Botticelli, Mantegna, Leonardo and Michael Angelo—Raphael being scarcely mentioned. In the account of Mantegna a curious omission may be noticed. Although the chapel in the Eremitani at Padua is mentioned, it is only to

speak of the four figures painted on the vault; the six fine frescoes of the history of St. James on one wall, and the two representing the Martyrdom of St. Christopher on the other, not being referred to, though they are the most striking decorations of the chapel and are among the best early works of the painter.

But it is an ungrateful task to point out a few omissions from among so copious a list of examples which cover so great a field, and bring before the eye and the mind so much of the history of art, which, as Mr. Crane says, "becomes, finally, the *only* history of races—the only record left of people to tell us of their intimate life, their hopes and fears, their struggles and their aspirations." "Eloquent books of the life of peoples and powers long ago covered by the drifting sands of time." The book is on the whole a good one, and should prove very useful both to students and to those of a greater age, who retain a studious attitude of mind. A. W.

HOUSE-PLANNING FROM THE ÆSTHETIC POINT OF VIEW.*

By H. HEATHCOTE STATHAM.

(Continued from page 376.)

BEFORE long, however, the quadrangle plan was destined to give way almost entirely before the favourite scheme of the later Renaissance, that of the centre block and wings, and as a system of house planning on a great scale nothing so grandiose has ever been devised. Vanbrugh, though he did not actually invent it, was the great high priest of this movement, the leading motive of which was, instead of

HIDING THE OFFICES AWAY.

as Bacon suggests, to make them contribute to the show. If we have to cover so much land with building, the architects seemed to think, let us make the most of it in the architectural result; let our stable wing on the one hand and our kitchen or laundry wing on the other serve to extend the effect and act as architectural supports to the central mass. Mr. Blomfield, in his admirable book on the English Renaissance, quotes the words of Reynolds in admiration of this treatment as used by Vanbrugh:—

"To support his principal object he produced his second or third groups or masses; he perfectly understood in his art what is the most difficult in ours, the conduct of the background . . . and no architect took greater care than he did that his work should not appear crude and hard, that is, it should not abruptly start out of the ground without preparation."

In fact, Vanbrugh had a great deal of the feeling of those who have been called sculptor-architects. In the case of Castle Howard, the lines of the balustrade fence on each side of the courtyard are as it were, modelled in and out in breaks and curves, to escape what Reynolds calls the "hardness" of straight lines. This same modelling of wall lines is a point also with Wren, as is shown, *inter alia*, in the admirably designed plan of the boundary walls between the street and the courtyard of the old Trinity almshouses, which we have lately just managed to save, and of which Mr. Thackeray Turner remarked with truth that those walls alone were enough to indicate

THE HAND OF WREN.

Vanbrugh's great work is, of course, Blenheim, a plan of the grandest type, with its great terraced and cloistered forecourt 350ft. long by 300ft. wide, and the kitchen and stable courts, each (with their surrounding buildings) about 250ft. by 200ft., opening from it to left and right. The plan is absolutely axial in both directions, two great longitudinal corridors running in parallel lines from wing to wing. Among other points it may be

observed that the use of internal courts to light the corridors, which is sometimes regarded as a very modern expedient, is used here for the principal corridor at all events.

THE QUADRANT TREATMENT

connecting the wings with the centre is another example of Vanbrugh's modelling. The use of quadrant corridors to connect the house with the separate outbuildings became a constant feature of the later Renaissance plans; in this case it is not a corridor, but a portion of the main building treated in this shape. It looks very fine in effect, but there is always this objection, that it involves the existence of odd-shaped triangular rooms in its rear. In this case these irregular spaces are utilised as dressing rooms in connection with rectangular bedrooms. It is one defect in the plan that the extreme right wing is one great gallery (180ft. long), and the corresponding left wing is divided up into rooms, though the exterior architectural treatment is identical in both cases.

THE GREAT GALLERY

should certainly have been a special feature; that is one of the pitfalls of absolute symmetry. Vanbrugh has been laughed at, too, for having made the chapel and the kitchen balance each in the angles of the outlying blocks, but this is not so illogical as it is said to be. Man was philosophically regarded in those days as a being composed of two elements, body and soul, neither of which could in this world exist apart from the other. The needs of the soul were provided for in the chapel on one side, and those of the body in the kitchen on the other side; both were equally necessary to a complete mundane existence, and Vanbrugh treated them accordingly.* The principal defect of Blenheim, in an architectural sense, is the want of a grand staircase, appropriate to the general grandeur of the plan. The main staircases, in two side halls on each side of the great hall, are convenient enough, but these halls are only 11ft. wide, leaving only about 5ft. for the width of each flight of stairs—a miserable proportion for so great a house.

AT CASTLE HOWARD

the staircases are planned in just the same way and of the same size. The staircase, alone in these plans, seems to be treated in a purely utilitarian manner; regarded as a means of ascent only. The architectural glory of a great staircase does not seem to have dawned on the mind of Vanbrugh. We may compare with Blenheim the magnificent plan of Charleval given by Du Cerceau, which, with its series of colonnaded courts—the great one in the centre and smaller ones on each side—the great square central block flanked by gardens, and the surrounding canals, is really sublime, and seems more like a castle in the air or a chateau on paper than a design seriously intended for execution. Across the canal at the back is a great, formal garden as large as the whole of the rest of the plan. Turning to the less magnificent but most interesting and varied English Renaissance plans collected in the "Vitruvius Britannicus," we find all kinds of variations played on the idea of outstanding wings connected with the centre by colonnaded quadrants. At Rowhampton House, by Archer, the quadrants are convex, and it will be noticed that the front walls of the forecourt show that same kind of modelling in curves which seems to come naturally from Wren's pupil. In the plan of Eaton Hall, the general square lines of Seaton Delaval predominate, the stables and other offices flanking the courtyard without even being masked by arcades; but the great semicircular sweep of the wall of the outer court is fine. At Beaconsfield (Millner), where the concave quadrant is again employed,

THE STABLE OPENINGS

are round on the outer side, not towards the courtyard. In that remarkably stately modern plan, Mentmore, in like manner the

kitchen wing fronts away from the house, and the back walls of kitchen and conservatory blocks, facing each other at each side of the forecourt, are made use of as decorative screens with niches for sculpture, so that they form part of the architectural pomp of the entrance. The quadrant connection at Beaconsfield is badly managed, as it does not butt against the house block, but returns on itself, leaving an open end. At Hopeton House, Scotland (Sir William Bruce—"justly esteemed the best architect of his time in that kingdom"), the convex quadrant is again employed, this time better managed in its connections; the staircase occupies a fine position in an octagon hall in the centre of the house.

AT LOWTHER HOUSE, WESTMORELAND.

(no architect's name) we have an entirely original arrangement. The advanced wings ending each in an elliptical hall (the chapel on one side, the library on the other), the forecourt slightly raised and protected by a balustrade, and reached by a semicircular range of steps projecting outward at a 40ft. radius; the whole embraced, as it were, by a range of arcaded cloisters on each flank, projecting beyond the forecourt. Braman Hall, one of Colin Campbell's own designs, shows a square block with two small wings connected on each side to the house by a lofty colonnade of three bays, with very bold effect; here, as at Blenheim, the outer blocks are the chapel and kitchen, treated identically. Castle Ashby,

A COURTYARD PLAN BY INIGO JONES.

takes us back a generation and illustrates one point in Bacon's plan, the staircases being placed in projecting turrets at the re-entering angles of the courtyard. Eastbury, by Vanbrugh, is very much on the same lines as Seaton Delaval, with the square forecourt with arcades down each side to mask the stable and kitchen wings, and the same vast rusticated order to the house. Here Vanbrugh again uses his favourite arrangement of the two staircases one on each side of the central hall, but in this case he is more liberal to the stairs; the central hall or vestibule, about 12ft. wide, is here only a connection between the great hall in front and the "Salon" at the back, while the stairs have an ample space 20ft. wide on each side, but shut off from the vestibule. At Seaton Delaval, the

STAIRS ARE PROVIDED IN A PROJECTING TOWER

at each end of the main longitudinal corridor (which crosses the end of the great hall), the towers being square externally, but the stairs elliptical on plan. At Grimsthorpe, Vanbrugh goes back to the quadrangle plan, and for once aims at a fine effect with his staircases, which are 8ft. 6in. wide in the lower flights and 7ft. in the upper, and placed within a double screen of columns at each end of a hall 125ft. long; the staircases visible through the columns and not shut away out of sight. At Burlington House the stable and kitchen wings occupied the middle portion of each flank of the courtyard, where the buildings of the learned societies now are, and the court was closed by the two quadrant colonnades at the end opposite the house—that colonnade which was so stupidly removed and allowed to go to pieces. At Houghton (Colin Campbell) the kitchen and laundry wings, connected by the habitual quadrant, are set back into the rear instead of being brought to the front, and the same is the case with the stable and offices wings at Duncombe Park (W. Wakefield) in which the quadrant is dispensed with, and the outlying blocks are more conveniently connected with the house than usual. In "Mereworth" Campbell contrives a square house with a portico on each face and a centre domed hall, which might be capable of charming treatment; unfortunately he has found nothing better to do with his staircases than to make them corkscrews in the piers of the dome; a very mean treatment for a house of this class. The plan of Kedleston (as shown on paper) with its outlying pavilions connected by quadrants, is well known, it has been in so many books; it is a kind of plan which looks more effective on paper than it

* A paper read before the Architectural Association on Friday, January 6th, 1899.

* The symmetrical treatment of chapel and kitchen occurs in other plans in the "Vitruvius Britannicus"; it is not confined to Vanbrugh.

ever can look in reality, as you can never see it all at once; moreover the

QUADRANTS ARE BADLY MANAGED;

instead of butting into the wings, they terminate in a blank end, and you have to make a right-angled turn to get any further. The treatment of the centre block of the house, with its great columned hall leading into the square salon, and thence to the garden steps, is really fine. On the other hand, the staircase is ignominiously packed out of sight in a side recess. The quadrants at Kedlestone, it may be observed, are closed, and with windows, not colonnaded. At Nostel (by Paine) the same idea is better carried out, though the interior plan of the house is very commonplace compared with Kedlestone. At Nostel we find a recognition of one of the drawbacks to the use of

THE COLONNADED QUADRANT.

The colonnade looked very pretty in itself, but the servants passed visibly to and fro along it, which must have looked out of place sometimes. So at Nostel the quadrant consists of a walled passage for the traffic, with the colonnade in front and concentric with it for effect, thus making the best of both worlds. The same contrivance was carried out at Fonthill, and in some others of the houses of this type. At Holkham Hall (by Kent) the pavilions at the angles are rectangular, and more closely connected with the house, but the main idea is the same as at Kedlestone. The treatment of the staircase at the end of the hall, with its wide lower flight of steps, is more dignified and stately than in most of these examples. A remarkable plan, standing quite alone in character, is that of Buckland, by Wood, of Bath. It has, indeed, more of the character of

A KIND OF STATE VILLA

than a mansion, but it is a very fine plan for internal effect. In this case the two end octagons are the chapel and the library, representing architecturally, shall we say, the soul and the intellect; the body is cared for in the basements under them, which are respectively wine and beer cellars, like Mr. Sherrick's vaults under Lady Whittlesea's chapel, in "The Newcomes." Stanlinch, which is also by Wood, shows somewhat the same general idea, but the arrangement of the doors in the central portion of the house is such as to lose the vista from end to end; this was probably intentional, as the right hand wing is a very spaciouly planned State bedroom suite, and privacy of approach to it would probably be consulted. In

THE LEFT HAND WING

is the principal room—the dining room; in this less religious plan the chapel is wanting. The staircase, unfortunately, is very poorly treated. Lastly, Moor Park (Thornhill) is a remarkable example of a stately approach, in which the quadrant colonnades, instead of being merely connections with the wings, are extended so as to form a mask to them entirely, leaving the planning behind them rather inconvenient; but the fine effect in front may be said to atone for this. The idea was probably suggested by Bernini's colonnades at St. Peter's. There are few things, to my mind, more fascinating than the study of this collection of plans, so full of fine suggestions of effect, so uniformly stately and dignified in their variety; one cannot help thinking, again and again, what one could do with them in actual architectural treatment. It is true that our enthusiasm, in a sense, is damped on turning to the elevations, except those of Vanbrugh and one or two others. The mechanical manner of the engraving and shading does not assist them; but, apart from that, one cannot help wondering that men who had such fine ideas of the basis of architectural design in plan, should have had such lame and formal ideas of their decorative treatment. But what of that? That only shows that there is something left for us to do. Now that we have shaken off the deadening influence of architectural scholasticism and red-tape, what splendid things we could do (could we not?) if we could only get the chance of treating some such mansion plans as these with the freedom and the richness of detail which we

could impart to their treatment in the present. Surely we could make something finer of this type of plan than of the irregular and so-called "picturesque" plan? But then there is

THE QUESTION OF CONVENIENCE—

a question which will not be skirted. Mr. Blomfield remarks on this head:—"It is, of course, necessary to isolate the kitchen and servants' quarters from the big rooms of a house, but such a total disregard of convenience and economy as is shown in these eighteenth-century plans would not be tolerated for an instant in modern house planning. The point of view has shifted." True enough; but has it not shifted a little too far? Let us continue Mr. Blomfield's sentence:—"Vanbrugh and his successors were permitted to subordinate the comfort of the house to its external Architecture. They began from without and worked inwards; the entire design was handled with a view to the realisation of

A CERTAIN COMPOSITION,

without regard to convenience of arrangement; and the consequence is that there is always a distinct architectonic conception running through the whole of any one of their designs, which is necessarily absent in the heterogeneous assemblage of buildings which compose most modern country houses." I think the latter half of Mr. Blomfield's paragraph rather gives away the first half. "A distinct architectonic conception!" Is not that worth sacrificing something for, unless we are to return to the "two sticks and a mat," in principle at all events? Let us consider that for a moment. What does the inconvenience really amount to? It lies mainly in one point—the position of the kitchen. That is what you will find again and again in architectural criticisms—the kitchen was 100ft., 150ft., 200ft., from the dining room, &c. Even in

THE MODERN EXAMPLE, MENTMORE,

before referred to, the distance from the kitchen door to the dining room door, taking the line along the passages, is 147ft. (I measured it on the plan). One could hardly in such case say with Milton (referring to the meal in Paradise), "no fear lest dinner cool." That is a real inconvenience; but there is no occasion to revive that. In these days of lifts the kitchen might be in the basement, or it may even be in the attic—perhaps with greater advantage to the avoidance of possible smells. All the provisions can soar up there in the lift with the greatest ease, and when prepared, by the same means descend to the serving-room. Apart from that kitchen question, the wing system of plan may retain all its architectural attractions not only without any sacrifice of convenience, but even with a certain convenience and suitability. In most

HOUSES OF THE LARGEST CLASS

there is now a bachelors' stair and a bachelors' suite of rooms, for visitors who are of that persuasion. Why not a bachelors' wing as a separate block, with a smoking room on the ground floor and bedrooms above? And then, one might match that at the opposite angle by a young ladies' wing, with a charming drawing room or boudoir on the ground floor. Then what opportunities for a delicate and appropriate contrast in the design of detail and ornament in the two wings, suggesting their opposite characters—sturdy strength symbolised in the one, beauty and grace in the other, at the same time keeping the general mass and outline of both sufficiently alike for architectural symmetry; a kind of symmetry far more interesting and eloquent than that frigid mechanical symmetry of the Renaissance, each pilaster and each urn on one side answering to a precisely similar one on the other side. I declare one's imagination is quite stimulated by the thought of the artistic opportunities that such an arrangement would afford. Nor is there any inconvenience in the arrangement of a laundry wing, and some other offices perhaps, connected with the main house by corridors, and yet separate, and turning their backs on it; the back walls being treated, as at Mentmore, in a decorative manner. The stable wing, it

is to be feared, will hardly be accepted now, unless where, as at Blenheim, the scale is so great that it is really a long way from the house. There is no occasion, however, that we should imitate the favourite form of plan of the Renaissance architects. I would only urge that it is not necessarily inconvenient and that its architectural capabilities have not been exhausted. But let us summarise the problem from

THE PRESENT POINT OF VIEW.

In a mansion of the largest class we have to provide for two distinct departments, very different in their architectural requirements, and yet which must be in tolerably close relation with each other. We have the owners and their family and visitors on the one hand, with the rooms in which their life is to be lived; and on the other hand, the servants and the rooms in which the work and supply of the house have to be carried on. Granting the principle that the mansion should be treated architecturally in a symmetrical manner (because no other treatment is so dignified), how are we to treat these two departments? The Georgian system was to have

ONE GREAT PARALLELOGRAM

of building, and divide it up as convenient, without any reference to the exterior design, which can hardly be called an architectural method. But if you wish for one great block, it is possible to divide the two departments vertically, and not horizontally; to have a lofty two-storied basement, with a very wide sunken area for the lower windows, and place the state rooms and living rooms on the first floor, with a great staircase up to their level. That is the old system of the Italian Renaissance palaces. It has been little, if at all, tried in England, but it naturally suggests an architectural treatment which would be very fine and effective indeed, and is worth thinking of. On the same principle of vertical division

THE SERVANTS' BEDROOMS

could all be collected in the highest story, occupying what in a classical building would be called the attic; and, as before observed, in these days of lifts, there is no difficulty in such vertical division. Another method is the favourite one of the Renaissance architects, of the wings connected to the house by corridor buildings, which has the merit of making the subsidiary department subserve the general architectural effect, and the inconvenience of which, as I have ventured to suggest, is, if it is properly managed, more imaginary than real. Then we may have, what is the more favourite scheme now, the servants' quarter and offices rather more closely attached to one angle of the main building, forming a second parallelogram placed *en echelon*, or a long wing stretching away to the rear. But in this case it is difficult to make it in any way part of the

MAIN ARCHITECTURAL DESIGN,

it must be retired and planted off out of sight. A central connection of the offices with the back of the main building may sometimes be possible—it depends on the plan of the house and the direction in which the garden is laid out; but in the most stately type of house, as a general rule, it is desirable to have the garden entrance on the central axis line and opposite to the main entrance, as it is in nearly all the great Renaissance plans. In regard to the house itself, there are three main points to consider: the approach and entrance, the hall and staircase, and the entertaining rooms. A forecourt of some kind, if possible flanked by something in the way of a colonnade or cloister on each side, always adds to the dignity of the house; the conventional sweep drive up to the door or a wretched landscape-gardener's substitute. And for the access to the house there is nothing so fine as a flight of steps—still more a double flight, in two curves, provided the basement is high enough to afford opportunity for it. We have had no greater loss than that of these beautiful flights of steps up to the doors of the old mansions; for which, in our modern anxiety for comfort, we have substituted that odious excrescence called the *porte-cochère*. Certainly, were I a millionaire

and could build a mansion to suit my own tastes, I would revive the flight of steps; but people coddle themselves so now that they are quite afraid of walking up an out-door flight of steps; they must forsooth be set down under cover, and for the sake of their vile bodies they sacrifice architectural dignity.

IF YOU MUST HAVE A PORTE-COCHÉRE,

better to have a central projecting tower or pavilion and make the ground story an open arcade or colonnade; then you may have a fine effect; then it appears as part of the architectural design; while the mere *porte-cochère* never looks like anything but an excrescence. Inside the house, you must have a large central hall, lighted from above, unless it goes right through the house with a great window at each end; and you must have above all things a spacious and noble staircase, not hidden away out of sight. A flight of stairs, well designed, is one of the finest objects in Architecture; and on a reception night with a crowd of guests, it is a fine part of the show; like Jacob's ladder, angels ascend and descend upon it. Where there is a very large hall,

THE STATELIEST STAIRCASE

will probably be one which is in the hall and forms as it were part of it; one may even commence it with a flight of half a dozen steps extending right across the hall. The difficulty in such a case is to plan it so that it will not interfere, above, with the integrity of the gallery or loggia which you will certainly have round the hall on the upper level. In the case of Bridgewater House, Barry, as Professor Kerr mentions in his book, intended at first to have the stair in the midst of the cortile, where the dotted lines are shown; on second thoughts he took it out of the cortile and made it a separate staircase at the end; the cortile may have gained, but the stair lost in dignity. Delicately modelled curves of the edges of the steps, in the wide lower flights especially, add much to the beauty of a staircase; on a small scale this is very well done in the charming staircase designed by the late Mr. Cockerell for the Society of Water-Colourists' rooms, which I recommend students to look at.

THE WEAK POINT IN A STAIRCASE,

to my mind, is the raking soffit, and it is well where it can be designed so that this is hidden and only the steps themselves are visible. This is very well done in the grand staircase of the Paris *Hôtel de Ville*, where two broad flights, between marble-lined retaining walls, start right and left from the lower hall; and this kind of staircase may be also applicable to a private mansion on a large scale, where the upper plan is such as to admit of landing the staircases at two widely removed points. At the same time it may be said that the double staircase has more affinity with the idea of a public hall than of a private house. Where the general plan allows of it, a flight of stairs on a long curve is nearly always fine; not a circular stair—that

LOOKS TOO UTILITARIAN,

as if it were done to save space—and the curve is too quick; but an elliptical hall, for instance, with a stair following its curves up on each side, is a noble scheme. But there is no end to the beautiful things that may be done with stairs, where there is space enough; they are the poetry of internal Architecture. As for the entertaining rooms, the great desideratum for them is that which applies also to the whole ground-plan of the house, viz.: that they should represent an architectonic conception, in the configuration of each room and in their relation to each other. Systems and ideas in planning are endless; the great thing is that there should be an idea, and not merely a space divided into rooms by walls. Another point that will almost always be right (though there may be exceptions in special cases) is that the principal dining room should be on the opposite side of the hall from the drawing rooms. Another is that the principal rooms should be planned on an axis, and should be capable when desired of opening out a vista through the greatest length of this portion of the house; remembering, as before suggested,

that mystery is not the attribute of a great house so much as grandeur. Then as to the question of inter-communication, a corridor, of the ordinary proportion of width, is not the best suited to such a house; it is a feature more characteristic of a public building; if there is a long apartment of communication, it should be rather of such proportionate width as may remove it from the category of corridors to what is more properly called a "Gallery;"

NOT A MERE PASSAGE,

but a long room which is also a passage. And in a state suite of rooms it is a question whether some of the rooms of ordinary proportions may not quite fitly be planned to open one out of another, and one be used as the passage to another. Upstairs, of course, we must have corridors—we cannot in the present day walk through each other's bedrooms in the nonchalant manner in which the inhabitants of many Elizabethan and Stuart mansions must have done; but in a suite of entertaining rooms on a great scale there is no objection to walking out of one into another, and there is even a certain added dignity in the arrangement, as if the house were on too grand a scheme to stoop to the mere utilitarianism of corridors. In conclusion, I would encourage those who have the chance of building large houses to

ENDEAVOUR TO REVIVE

in them some of the old stately character which, as it seems to me, has been sadly lost during the present century, through a mistaken craving after what is called the picturesque; and not to be afraid of trying new and original dispositions of plan merely because they are new and original. Why is a form of plan which promises a fine effect to be shirked merely because it is unlike what people are used to? As an example of

A MODERN PLAN

of great originality and beauty we may take that of "Chesters," by Mr. Norman Shaw; also a plan with an idea, and a fine example, moreover, of the novelty and effectiveness in house-planning which is within our reach if we will give our minds to it. There is far more to be done in the way of invention and fine effect in the planning of the higher class of mansions than has yet been done; while we can emulate, in new forms, the stateliness combined with variety of the Renaissance plans, we can clothe them with detail much more free and expressive than the dead scholasticism of the Orders with which our able Renaissance predecessors were fettered. But we must begin with the plan.

A discussion followed, in which Professor Aitchison, Messrs. Halsey Ricardo, Beresford Pite, Francis Hooper, and the Chairman (Mr. G. H. Fellowes Pryne) took part.

The Largest Bell in England.

To the Editor of THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

DEAR SIR,—In the issue dated January 11th of your valuable paper, under the heading of "Bricks and Mortar," there is an interesting article on bell hanging and tuning, but the following paragraph is very inaccurate: "Big Ben is, of course, the largest bell in England, weighing over 13½ tons." The largest bell in the United Kingdom is the Great Bell of St. Paul's, London, which weighs 17½ tons, and was cast by Messrs. John Taylor and Sons (the world-renowned bell founders), of Loughborough, Leicestershire, in 1881.

There will be hundreds of people in the district in which it was cast, who will remember the event, as it was on public view in the foundry for some time, swung over the mould in which it was cast. It also caused considerable interest at the time, owing to the founders having to construct a special trolley for its transit to London by road, propelled by a traction engine from the foundry to its destination; it being too large to go under the railway arches.—I am, dear sir, Yours truly,
S. NEEDHAM (Arch't.).

ENLARGEMENT

OF THE

Builders' Journal

AND

Architectural Record.

For the past four years one of the most attractive features of

THE BUILDERS' JOURNAL

has been the Art Supplement which has been issued weekly as an inset sheet. From time to time this Supplement has been increased by the addition of a second Double-Page Inset Sheet.

We have now pleasure in announcing that the management have decided to make this a permanent feature. From the beginning of the next volume each issue of THE BUILDERS' JOURNAL will contain

Two Double-Page Plates as Inset Sheets.

In addition to this permanent enlargement, we shall introduce with the first number of the new volume, dated February 8th, a number of improvements and new features, which will, we think, substantially increase the value and attractiveness of THE BUILDERS' JOURNAL & ARCHITECTURAL RECORD, and cannot fail to extend its already wide popularity.

Full details of these improvements will be announced in due course; but generally we may say that our aim will be, without lessening in the slightest degree the artistic character of the Journal which has made it so popular amongst Architects, to meet the needs, even more than we have done hitherto, of Builders, Contractors, and all Craftsmen engaged in the Building Trades.

The first number of the new volume will be No. CCIX., dated February 8th

R. I. B. A.

SOANE MEDALLION AWARD.

A WIDE disapproval has been manifested at the late award by the Institute of the Soane Medallion. The subject, "Design for a Concert Hall, to seat 2500 persons," is the same that was set last year, but owing to the inferior quality of the work submitted on that occasion the Prizes Committee decided that no award should be made, and that the same subject should be set for this year also. The group of designs submitted in the present competition are, perhaps, of greater merit than those which were exhibited last January, and the question whether the award has been made to the author of the best design has not been raised, but it is felt very strongly that the motive which prompted the Prizes Committee to withhold the medallion last year should operate also in the present instance, and that no name should be added to the list of Soane medallists this year. It is supposed that the Committee, having twice imposed the same subject upon competitors, felt under a certain obligation to allot the prize on this second occasion, or were at least anxious to do so, for there seems no doubt that the design they have distinguished with first place, is unworthy to be ranked with those that have won the medallion in the past; and as it has been always the custom to withhold the prize, except when the design shows distinguished merit, the decision of the committee this year is justly held to depreciate the distinction which has been conferred upon previous recipients of the medallion, and to be unfair to those who in the past have submitted designs of greater merits than that now in question, and yet have not been considered worthy the high honour of being Soane Medallists. This prize is highly esteemed and much coveted, and we can well appreciate the jealous distrust with which any depreciation of the high status it has always maintained is regarded by the rising generation of architects. That this distrust is warranted in the instance of the present design there can be no question. The elevations show a heavy lugubrious classic building devoid of distinction or character although scholarly. The plan is simple and has breadth, and is well designed for interior effect, but these merits entirely vanish when it is observed that this has been achieved only by a wholesale neglect of the practical essentials of a concert hall, and by entire disregard of the terms of the competition, which explicitly stated that the regulations of the London County Council should be observed. In the first case, we may mention such glaring faults as that the stone columns and pilasters on the elevations, with entablature and balustrade and part of the roof, are carried on the lead flat over corridor on street floor; there are no pay boxes; the Royal party is provided with no private staircase, and with but one w.c. and no cloak room; and the artists, chorus, and orchestra, to the number of 310, have to enter and return by a staircase 2ft. 9in. wide in the clear. Some of the most notorious instances of variation from the Regulations of the London County Council are as follows: The ground floor corridor is only 4ft. 6in. wide, instead of 9ft. as it should be. Gallery stairs have only 7in. treads and less, instead of the 11in. or more required. There are nineteen closets on ground floor, six on first floor, and three in gallery all without windows, and twelve of these are not against external walls. Artistes have no independent exits, their dressing rooms are not cut off from "the place of public resort" by party wall as is required, and w.c.'s provided for them do not ventilate to the open air. None of the stone stairs used by the public are supported on both sides or enclosed by walls according as the regulations require. Some of the doors opening into landings and promenade, and from stalls, obstruct the passage ways. There are other irregularities, but these will suffice to show that the protests being made against the award of the Soane Medallion this year are of just and fair foundation. We

understand that an appeal has been formally addressed to the Committee of the Institute asking it to reconsider the award of the Prizes Committee, chiefly on the ground that the design which has won the medallion does not comply with the Regulations of the London County Council. We shall complete our notice of the various prize designs and drawings in our next issue.

THE PRESIDENT'S ADDRESS.

THE chief business at the Institute meeting on Monday evening was the delivery of an address to the students by the President, Professor Aitchison, R.A., and the presentation by him of the awards gained in the recent competitions. The meeting did not pass off without indications of the feeling that has been aroused in the matter of the Soane medallion award. During the presentation of the prizes, it was deemed expedient to interrupt the even tenor of that agreeable function with an official announcement to the effect that the Soane medallion was awarded to Mr. Mellon's design as being the best sent in, notwithstanding that it contravenes certain provisions of the London Building Acts. At the close of the meeting a student rose, and, amidst sympathetic applause, asked the President whether the conditions for future competitions for the Soane medallion were to be considered by the Institute, or should the students design as they pleased? "I have no doubt," said Professor Aitchison in reply, "you will find in the printed programme for the next year everything that you require," a diplomatic reply that was received with ironical cheers.

The following are the salient points of the President's address:—

I have remarked that all the sciences and arts seem to go in cycles. It is not very easy to trace the cause of these epochs, but we can safely say that, at the present moment, the epoch is that of the application of science, which is on the top of the wheel of fortune, while architecture is very low down. When these epochs occur, the whole atmosphere, as it were, is full of the desire for excellence in the particular art or science then coming into vogue, as a knowledge of Roman architecture was at the time of the Italian Renaissance; and at such times men of the most transcendent abilities have an ambition to succeed in the new fashion, even though it promise but little wealth, and very often nothing but the escape from starvation, even if it offer that. A great incentive to any kind of study or achievement is that of being thought well of by your contemporaries, though there is a higher stimulus in the hope of that sort of immortality which mortals can attain.

One of these inducements at the present time is impossible to be looked for—I mean the admiration of your fellow-men; for who knows or cares whether your work is good, bad, or indifferent, except perhaps a brother architect? It is questionable whether there is enough stimulant in these days to attract men who possess the intellectual faculties necessary for producing fine architecture—I mean such architecture as will be admired for two or three thousand years. I hope that my observation has been wrong as to the chances of immortality for those whose works are disregarded by their contemporaries, for, if the architect is really before his time, he should be recognised by those that come afterwards. I think I understate the case if I say that one considerable architectural genius is to be found among 100,000 of the inhabitants of any highly civilised country. To be a great architect involves a capacity for acquiring the higher branches of mathematics and being able to use them; to comprehend at least that branch of natural philosophy that is called statics, and even to advance beyond the point at which it has then arrived; to so arrange a building as not only to fit it for its purpose, but to put it in a shape that will command the admiration of skilled and cultivated beholders, and to invest the finished structure with a capability of exciting emotions that are proper to its use. Architec-

turally this is brought about by simplicity, perfection of proportion, by outline, by the proper disposition of light and shade, and by size and mass. To the former qualifications of the architect must be added the capacity of knowing what additional interest can be given to important parts by sculpture, and how colour can be properly applied to the whole structure.

Since the application to building of cast-iron, wrought-iron, and steel, the engineers have surpassed even the wildest imagination of sixty years ago. The Britannia Tubular Bridge is, as far as I recollect, 500ft. span, but Sir Benjamin Baker has made a span of the Forth Bridge over 1700ft. It is very unlikely that any architectural work would require a span of more than a tenth of that bearing, and that supposes an extension of more than double the span of the largest groined vault of the Romans, which was only about 80ft. Still we must to a certain extent look for the advancement of Architecture in a nicer adjustment of the mass to its height and to the weight to be carried, and to the form to be given to the supports for the weights and strains that come on each particular piece. In the use of iron and steel architects are very much handicapped, first on account of the slenderness of proportion which, as a rule, renders them unfit to compose with the weaker material, but mainly on account of the little resistance these materials offer to the action of fire, unless they are protected by fireclay and terra-cotta; and when they are so protected they very nearly approximate in size to the supports of old-world structures. Still, as I have so often said before, I think if the mediæval architects had possessed these materials and been able to work them as we can, they certainly would not have abstained from using them, as architects of the present day have mostly done. What visions does the use of cast-iron raise in our minds as to the possible size and height of buildings! What new forms and shapes does not cast-iron suggest when we know that it will take any form we please and any ornament that can be cast! What visions of colour does it not evoke when it may be made resplendent with enamel!

No one can say that convenience in planning is not greatly studied in the present day, but this convenience has mostly been of the purest utilitarian sort: it has been a question of how the accommodation wanted can be packed anyhow, which should not be the aim of architectural planning. The other thing to be aimed at is to give expression to the thoughts, cultivation, and aspirations of the present day, a subject that requires the deepest study and a perspicacity that is rare; for, though we are quite certain that many buildings have not got the proper expression, it is not so easy to say how the proper expression should be got. We have ransacked all the civilised Architecture of the past and made collections of it for use, but we have certainly not applied the examples with discretion. The delicate ornaments and suggestive sculpture that were applied to the embellishment of the boudoirs and pleasure-houses of Renaissance beauties are now lavished on oyster-shops, public-houses, and clothiers' warehouses, on which fluttering cupids are out of place; and the magnificence and stateliness of the palaces of great nobles now deck stores or hotels. We can at once pronounce these to be absurd, but we can hardly lay down a rule for the right expression which should be applied to the immense variety of buildings that are erected.

You know that Architecture is the most difficult of the visual fine arts, yet there is much more labour spent on learning painting and sculpture than there is on learning Architecture, and the votaries of these fine arts commonly have more natural aptitude to start with. We know the painful years students of painting and sculpture devote to getting the groundwork of their art, while from three to five years spent in an office, mostly in tracing, is thought enough for an architect.

There are two points to which I beg to draw your particular attention—first, that Architecture is a structural art, and that all an architect can do, as an architect, is to build: in

his structures he has to show his knowledge, taste, and skill, his learning, morals, cultivation, and aspirations. The Mediæval architects in their ecclesiastical buildings showed their hopes and adoration by lanterns, towers, and spires, by lofty naves, daring construction, and intricate patterns. When we have arrived at their pitch of knowledge and skill we must show our parts, inventions, and aspirations in similar ways, not as they did with almost pure geometrical figures, but in more graceful, refined, and daring work. Secondly, to point out the comparative scarcity of the use of coloured and glazed materials for external facings where the greatest beauty of colour and form may be used. It is refreshing even to think of London and other manufacturing towns presenting to us beautifully coloured fronts, that do not want painting every year, and would render such towns cheerful, if not delightful, to look on, in the place of the dingy, sooty, and depressing houses faced with stone, brick, or plaster; and this would not only raise our spirits under our leaden skies and perpetual drizzling rain, but be more healthful, for glazed pottery absorbs but little moisture, and is easily cleansed from dust and soot.

At the close of the President's address Mr. H. Beresford Pite delivered an address criticising in detail the works submitted for competition. Mr. H. H. Statham made some remarks on the designing of concert rooms, with special reference to the Soane medallion designs. The President then presented the awards, a full list of which appears in our last week's issue.

THE ARCHITECTURAL ASSOCIATION.

ANCIENT AND MODERN BUILDINGS IN PALESTINE.

By A. BERESFORD PITE, F.R.I.B.A.

A MEETING of the Architectural Association (Mr. G. H. Fellowes Prynne, President, in the chair) was held at 9, Conduit Street, Regent Street, W., on Friday evening, January 20th, at 7.30 p.m. The minutes of the previous meeting were read and confirmed, and the following gentlemen were elected members of the Association: Messrs. B. E. Crockett, L. W. Grace, E. B. S. Shepherd, E. E. Shrewsbury, Montagu White, R. E. Peach, A. Potter, and C. C. Thompson. It was then announced that the spring visit of the Association would take place on February 4th, to inspect the Carlton Hotel.

The president then called upon Mr. A. Beresford Pite, F.R.I.B.A., to give his lecture upon "Ancient and Modern Buildings in Palestine." Mr. Pite stated that he proposed to deal more especially with modern building in Palestine than with the ancient buildings, for he found it impossible to adequately go into the whole subject covered by the title of his lecture, as it covered too large a ground. The ancient objects of architectural interest in Palestine were caves, rock tombs, cisterns, oil and wine presses, and sarcophagi. In Palestine architecture, the first period appears to begin with Egyptian influence, then proceeding to Assyrian, Phœnician, Græco-Roman, and Arabian, then the Crusading period, and the Turkish, and lastly the Modern period. He was sorry to see, when on a visit to the hospital he had lately erected at Jerusalem, that the Gothic Revival had had existence even in Palestine. The best remains of antiquity appeared to exist on the east of the Jordan, where, from the time of Mahomet, the natives have not used buildings but live in tents.

Building in Palestine is influenced by the material, which is hard, coarse-grained limestone, rendering fine sculpture impossible. In modern building, the most important consideration to be observed is that of aspect. It is advisable to avoid an eastern aspect, but in Jerusalem it is always desirable to turn the buildings away from the road to avoid the penetrating dust.

Water is another important consideration.

In Jerusalem there are only two wells, and the town is therefore without efficient water supply and wholly dependent on rainfall. Rock-cut cisterns, either underground or covered over in the courtyards, are therefore provided to store the rain water. In the absence of much water mortar has to be carefully considered in building. The time to commence operations is in the early spring, just after the rainy season is over.

There is an absence of drainage which has to be considered, and no system of proper cesspit can be adopted on account of the rock, which lies everywhere near the surface. And, further, there is no depth of earth to allow of earth closets being adopted, the earth only lying in shallow pockets. For warming purposes fireplaces are not generally used, but if it is cold enough to require a fire, small closed stoves are brought inside, flues for this purpose being built into the walls. Fireplaces are generally only found in the Russian houses in Jerusalem. The carriage of materials in the country is difficult, for the transport to Jerusalem is by camels, thus only admitting of small girders and light weighted articles being used. The railway from Jaffa to Jerusalem is at present of no use for this purpose, being only a light tramway, and has all it can do to ascend the steep inclines.

The local authorities in Jerusalem are well organised, and an excellent system of land registration is adopted. Small buildings can be erected without special sanction, but for buildings of considerable size permission must be obtained. When it was proposed to erect the hospital designed by Mr. Pite, permission to build was at first refused, the Turkish officials holding that it was a beer-shop, from the use of spirits in the dispensary, and so could not be built near the tomb of a saint opposite; but, after considerable expense, it was settled that the building could be erected within 250ft. of the tomb, the saint's sanctity not being infringed at that distance.

One of the difficulties that had to be met in building this hospital at Jerusalem was that there was no contractor, but the plans were accurately carried out by Mr. Theodor Schick Sandel, a German, who had acted as a sort of clerk of works for several architects in Jerusalem, and who provided very accurate estimates. Mr. Pite wished to make his acknowledgment of the great service rendered by Mr. Sandel. Mr. Sandel had had the paying away of the money, as it was absolutely necessary that the man who gave orders to the workmen should be the one to pay, or they would not have obeyed him.

At Jerusalem there is an absence of sand, but against this there is a magnificent supply of lime. Dirt is used instead of the sand, being mixed with lime in the proportion of about half and half. Masonry walls are there built about 2ft. thick, thicker than in Europe, and stand as well as those built in this country with the ordinary kind of mortar.

In careful jointing, where some sandy material was wanted, pottery dust was used, broken pottery being obtained and ground between stones by hand labour. This dust was used for pointing, to stone roofs especially. For carefully jointing external walling putty and white lead was used. The native plaster for cisterns is usually about 2in. thick.

As the stone walls are porous, owing to the necessary use of a large quantity of the mud mortar, some kind of weather-proofing is necessary, and Mr. Pite found a brick lining satisfactory. The best method of walling is to adopt two thicknesses of stone, filled in with rubble. This method is called "Kallin." Another method is to adopt a face of wrought stones, with smaller ones behind to make up the thickness. This is called "Midmak" or "Laktah." "Misseh" is the hard facing. The bricks are obtained from Marseilles. There are, of course, native bricks but these are sun-dried and very inferior.

The natives are well accustomed to vaulting, which they do cheaply. Roof tiles are used much in modern building, but stone roofing is cheaper.

Mr. Pite then gave the following particulars and prices in Jerusalem, which he thought

might be useful. The prices were supplied by Mr. Sandel:

Lime, about one-twelfth the cost of whole building.

Lime, one-fifth the cost of the walls, including plastering.

The lime in a plain girl's school at Jerusalem, one-seventh to one-eighth cost of walls.

In a square metre of walling each side of the wall contains 11 stones, the method of measuring being to count the stones.

Inner side of a stone wall costs about 1 piastre per square metre.

Outer side, hewn, of a stone wall costs about 2 piastres per square metre.

For both sides together, 30 piastres per square metre. Add for lime 5 to 6 piastres, and for wages and hauling, 10 piastres per square metre. Wall in all costing about 50 piastres, or 12½ francs, per square metre.

For foundation walls, 10 to 11 francs per square metre.

For walls above ground, with one wrought face, 14 to 16 francs per square metre.

For partition walls, 6 metres thick, 10 francs per square metre.

For Dolma walls, i.e., wooden framework filled in with masonry, 6 francs per square metre.

For vaultings, 8 francs per square metre, including supply of all necessary centering, &c.

For façade stones, add 1½ to 1¾ francs per square metre, 100 pieces being obtained for 10 to 14 francs.

For external pointing, ½ franc per square metre.

For corner stones or quoins, 2 francs per square metre.

For lintels or cornices, 3 francs per metre run.

For door or window opening, 40 francs; size immaterial.

For plastering, 1½ to 2 francs per square metre. Cementing new cisterns, 3½ to 4 francs per square metre. Ceiling plasterings, 2½ francs per square metre.

For tile roofs, including labour, wood rafters, nails, &c., wired to battens, 12 francs per square metre. They require rewiring about every ten years. The tiles come from Marseilles and cost about 25 francs per 1000. About 30 go to a square metre super. With heavier woodwork, 14 francs per square metre.

For windows, glazed, painted, and fixed, 50 francs.

For internal doors, complete and fixed, 50 francs.

For shutters, per pair, complete and fixed, 40 francs.

For iron bars, ½ franc a kilo, fixed.

Reckon 12 francs per cubic metre for a roughly built and unplastered building, i.e., 4d. per cubic foot.

For bricks, 7 to 12 francs per 100, or £4 to £5 per 1000.

For paving tiles, 6 to 8 francs per square metre, or £1 per square.

For timber, 18 to 20 feet in length, 20 francs per cubic metre.

For building in Jerusalem the price is generally 12 francs per cubic metre, 10 francs for foundations, and 10 francs for cisterns.

Mr. Pite next went on to describe the hospitals of Jerusalem. In the Rothschild Hospital the whole of the basement of the wards is taken up by tanks. The Greek Hospital is on one floor, and has flat stone roofs. These two and the Russian Hospital are all badly planned. In the English hospital he had built at Jerusalem he had set it above the ground on a vaulted floor, thus allowing access of air underneath. He had built according to the native methods of construction. The lecturer then proceeded to show many entertaining lantern slides of modern and ancient buildings in Palestine.

Before the meeting closed the following resolution was adopted:—"That this committee, recognising and appreciating the efforts made by the London County Council for the embellishment of London, views with the utmost concern the manner in which it is proposed to rebuild Vauxhall Bridge, and desires to express its sense of the unfitness of the design for a work of such architectural importance."

Our report of the discussion which followed Mr. Pite's lecture is held over till next week.

The Architectural Association and "Specification."

THE MODEL CLAUSES.

THE recent discussion of the Architectural Association on works dealing with specifications—reported in these columns last week—has been particularly useful in two ways, for not only have architects been led to state their opinion upon the value of these works, but they have also suggested some improvements which might be made in them.

Many of these ideas had already been considered in regard to "Specification," but the necessity of employing only reliable contributors to put them into form must account for the delay in their appearance, for good men have few opportunities for taking up such work, however much their sympathies may be with us.

Confining myself, however, for the sake of brevity, to the question of the model clauses, I may state that the need of revising and extending those in "Specification" has never been overlooked. But when, some time back, the actual work was begun, it was found that revision only meant making confusion worse confounded. This is owing not to any particular fault in the clauses themselves, for they are very fair specimens of their class, but to the whole system of architectural specification writing, which, speaking generally, is lamentably defective. Briefly, the three great faults in architectural specifications are:

1. Congestion.
 2. Useless Repetition.
 3. Want of method and proper arrangement.
- The great object of the architectural specification writer seems to be the cramming into one paragraph, and, if possible, into one sentence, of everything that he wishes to say concerning the particular portion of the work he is specifying. Then follows a confused jumble of methods of execution, qualities of materials and their sizes, and the result is horribly confusing, and not infrequently entirely without meaning. In writing specifications, the architect might well take a hint from the engineer, who long ago solved the problem by dividing his specification into three parts, under the headings of "General Conditions," "Materials," and "Workmanship." This reduces the matter to one of the utmost simplicity.

Under the first heading come the general conditions governing the whole work. Under the second heading, the engineer enumerates the materials to be used in the work, their nature, quality, and (as far as possible) size. Under "Workmanship" are specified the exact methods of using the materials.

Now this system is perfectly applicable to Architectural specifications. The engineer, it is true, does not use trade headings; but this difference is by no means a fatal one, as "Materials" and "Workmanship" can be used as minor headings under each trade heading. I have also seen this arrangement reversed, and the various trade names used as minor headings under the two heads of "Materials" and "Workmanship," but on the whole, the first method is preferable.

I have detailed this system at some length, because it is the method which has been adopted in regard to the clauses in "Specification," and the rearrangement is being pushed on as rapidly as possible for the fourth number, due next July. I am sorry that space does not permit me to give examples of the system, but in the forthcoming Third Number the clauses under "Roadmaker" will be found in this order, and a complete specification for sewerage work on the same principle will be found under "Drainlayer."

Commencing with the Third Number, Specification will appear as a half-yearly publication, a change which is due to the difficulty of getting such an immense work through the press. At least, the extension of time will give us a better opportunity of giving effect to the many kind suggestions and appreciative criticisms which the Association meeting produced.

THE EDITOR, "SPECIFICATION."

KEYSTONES.

It is proposed to erect new Board Schools at Colne.

A new wing to the Aberdeen Church of Scotland Normal School has been opened.

The new School for Blind Children, in Church Road, Wavertree, has been opened.

It is intended to erect a monument to the late Sir George Grey in St. Paul's Cathedral.

A new Technical Institute is being erected at Selly Oak, the estimated cost of which is about £3300.

IMPROVEMENTS have been recently carried out in the exterior and interior of the Catholic Church of Carriganima.

A STAINED glass window has been placed in the chapel in Lathom Park in memory of the late Countess of Lathom.

PLANS have been passed for the erection of a new Roman Catholic Church at Motherwell. The building is to accommodate 1200 people.

The window placed in St. Mary Stoke Church as a memorial to the former rector, the late Canon Bulstrode, was unveiled last week.

It is proposed to add a new wing to the Corporation Hospital for infectious diseases, in Moss Lane, Southport, at a cost of about £800.

The new infirmary at Ripon was opened on Friday. The cost of the building has been about £2750. The architect is Mr. F. H. Hargrave, of Ripon.

ANOTHER memorial of the Queen's Diamond Jubilee has been completed. This is the cottage hospital at Chippenham, which was opened on January 13th.

The erection of a new high level railway bridge over the Tyne at Newcastle is contemplated by the North-Eastern Railway Company, at a cost of about £500,000.

MESSRS. CHARLES A. NICHOLSON AND HUBERT C. CORLETTE, architects, have changed their address from 28, Theobald's Road, to 2, New Square, Lincoln's Inn, W.C.

The building operations at Hertford House are fast approaching completion, and it is hoped that most of the collection bequeathed to the nation will be on view this summer.

A COLLECTION of drawings by the late Sir Edward Burne-Jones is now on view in the gallery of the Burlington Fine Arts Club. The exhibition will remain open until March 12th.

CONSIDERABLE architectural improvements have lately been made in Belfast by the widening of Upper North Street and the erection of a number of substantial buildings in that thoroughfare.

At the last meeting of the Council of the Royal Society of Painter-Etchers and Engravers, Messrs. Meyer, Milner, Newbolt, Tomkins, and Wright were elected members of the Society.

COLONEL JOHN MORGAN, the Mayor of Brecon, has signified his intention of laying down, at his own cost, plant for the electric lighting of the town. It is estimated that this will practically mean a gift of £6000.

THE work of erecting the new Technical School at Oldbury has commenced. The total estimated cost of the building (including furnishing and equipment) is £6000, towards which £4000 has been subscribed or promised.

THE members of the Leeds Association of Engineers, to the number of about sixty, at the invitation of the Leeds Steelworks Limited, paid a visit last week to that establishment, and inspected the various processes of manufacture.

A CARVED oak pulpit is being made by Messrs. Sharp and Emery, of 17, Great Brunswick Street, Dublin, for Clonfert Cathedral. It will cost £190, and is the gift of Mr. Thomas Roderick O'Connor, in memory of his mother.

A new infirmary and laundry for the Wakefield Union was opened last week. The buildings, which stand near the workhouse, have cost about £40,000. The infirmary will have accommodation for 150 patients, with residence for medical officer, lady superintendent, nursing staff, and servants. The laundry buildings comprise an extensive block, situate near the eastern boundary of the site. The architect was Mr. W. Watson.

THE Lighting Committee of the Grays Urban District Council have adopted a scheme prepared by their engineer, Mr. A. H. Preece, for the electric lighting of the town. The cost of the electric light to begin with was estimated at 6½d. per unit.

THE residents in Torquay have decided that a pavilion would be a desirable addition to the town, and would be likely to prove attractive to visitors. A committee has been appointed to consider how the proposal can best be carried out.

THE Brandon Free Methodist Church, Jacob's Wells Road, Bristol, has just been opened, and accommodates about 200 persons. It is in the early Gothic style, the front being of pennant stone with freestone dressings. The cost has been about £1950.

MR. ELLIS ROBERTS's portrait of the late Sir Henry Doulton, the "Great Potter," has just been completed, and, in a short time, it will be presented to the Wedgwood Institute at Burslem. The painting is said to be a splendid likeness of the late Sir Henry.

THE new temporary Church of the Holy Name at Upper Beachwood Avenue, Ranelagh, has been formally opened for Divine worship. The present building is an unpretentious structure, and it may be expected that before long a permanent church will take its place.

CREDITON CHURCH governors have granted permission for the completion of the restoration of the church by placing oak stalls in the chancel. The Vestry Committee has selected Mr. Tate, of Exeter, as architect, and his plans will be presented to the governors and to the parishioners.

SIR BENJAMIN BAKER, engineer, and Mr. John Aird, M.P., contractor, have left London for Egypt for the purpose of inspecting the enormous works which are now in course of construction at Assouan and Assiout for the new Nile reservoirs. Over 5000 men are employed on these works.

WORK has been begun at Verona during the past week for renovating the tomb reputed to be that of Shakespeare's Juliet. It is intended to restore the entire edifice, which will be made twice its present size. The small arches which are now seen in front will be continued at the sides, and the tomb will be set in the centre of the structure.

THE Jubilee statue of the Queen for erection in Dundee has been completed, and is ready for delivery. The site of the fountain at the Albert Institute has been proposed as the proper one for the statue; the fountain, it is suggested, should be removed a little to the north. The artist who has been entrusted with the work is Mr. Harry Bates, A.R.A.

MESSRS. J. YOUNG AND CO., builders' merchants, Kenton Works, Kennington Cross, London, S.E., inform us that owing to the rapid increase in their business they have opened new premises at 321, Kennington Road. The new building is to be devoted to the Paper-Hangings Department. They have also added extensive showrooms to the main building.

ACCORDING to an Italian newspaper a wealthy Englishman has offered Signor Baccelli, the Minister of Public Instruction, to undertake at his own expense the excavations in the Forum and the partial reconstruction of the ancient monuments. The work of reconstruction is to be made under the direction of a commission of archaeologists of different countries.

At the monthly meeting of the Bristol Society of Architects, held at the Fine Arts Academy, Bristol, on the 16th inst., the award was made in the Students Competition for measured drawings. The first prize of six guineas went to Mr. C. F. W. Denning, the second and third prizes being equally divided by Mr. H. F. Smith, and Mr. E. G. Rodway. The subjects drawn were of local and historic interest, and included Kewstoke Church and Cleve Abbey, Somerset, the Cupola of All Saints Church, City, the Mede Tomb in St. Mary's, Redcliffe, and the interesting little Georgian Church on Redland Green. After the general business of the Society had been transacted a paper of much literary and artistic interest on "Rhythm in Design" was read by Mr. F. Bligh Bond.

THE Local Government Board have held an inquiry at St. Annes for the purpose of obtaining particulars of applications for power to borrow £4000 for the erection of a fire station, slaughter-house, mortuary, and town's depot, £3500 for the erection of a refuse destructor, £1583 for a sewer in Clifton Drive South, and £350 for the purchase of a fire engine, or, in all, just over £9400.

MR. AITCHISON, President R.I.B.A., is the assessor for the plans for the rebuilding of the old Sessions House in the Old Bailey. The City Lands Committee have asked the council of the association to nominate six architects, who will be asked to compete in the preparation of plans. Each unsuccessful competitor submitting a complete set of drawings, with estimates, will receive an honorarium of 200 guineas.

Owing to the indisposition of Dr. Rentoul, Q.C., M.P., the reading of his paper upon "The Law Relating to Commission," which was to have been given before the Auctioneers' Institute on the 24th inst., has been postponed. On that date Mr. Harold Griffin will read a paper before the institute on "Some of the Acts of Parliament Specially Affecting Property in London which have to be Considered by Estate Agents."

THE preliminary arrangements for the holding of the forthcoming art loan exhibition in the Art Gallery at the Guildhall are in full progress. The exhibition, which will probably be opened about April 10th, promises to be an attractive one, as an effort will be made to represent the great painter Turner by an adequate collection of his works in oils and in water-colours, and also by a collection of plates from the Liber Studarum.

At the business meeting of the R.I.B.A. on January 16th, the following elections were made:—As Fellows, Messrs George Hornblower and Henry Hoyne Fox; as Associate, Mr. John Alfred Jones. In our report last week of the ordinary general meeting of the Association, which followed the business meeting, a mistake was made in stating that the chair was taken by Mr. W. J. Locke. The chairman was the Vice-President, Mr. E. A. Gruning.

THE ancient Church of St. Andrew, situated in the little valley of Dalton-le-Dale, near Seaham Harbour, is gradually falling into decay. The walls are crumbling, the ceiling shows signs of breaking away in places, and the bell-cote is no longer safe. Recently the building was surveyed by the Diocesan architect, who expressed opinion that repairs which will entail an expenditure of something like £700 are absolutely essential if the church is to be saved.

UNDERNEATH the fine metal screen of the Battenberg Memorial Chapel, in Whippingham Church, has been placed a brass tablet, bearing, in facsimile of the Queen's own handwriting, the following words:—"This screen is erected to the dear memory of her beloved son-in-law, Prince Henry of Battenberg, by Victoria, R.I., 1897." A beautifully worked sword has been fixed on the tomb of the late Prince Henry. These recent additions are both the work of Mr. Gilbert, R.A.

THE London County Council have given permission for a memorial tablet, which a committee of eminent engineers are desirous of erecting to the late Sir J. Bazalgette, to be placed on the wall of the Victoria Embankment at a point facing the end of Northumberland Avenue, and near the Charing Cross pier. Sir J. Bazalgette was for many years chief engineer of the late Metropolitan Board of Works, and the Thames embankments were constructed under his supervision.

THE civil engineer of San Francisco reports that the city is sinking at the average rate of 2in. a year. In a hundred years the waters of the bay would be ebbing through the first stories of buildings, and the second floors would be awash. But energetic steps are being taken to cope with this curious state of affairs, for the gaps are being filled up as they occur. The cause of this peculiar condition is ascribed to the nature of the soil, which is a mixture of alluvium washed down from the hillsides, ooze from the bay, and decayed vegetable matter, the formation of ages, upon the original bed rock.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
January 25th, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slabs; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

At a recent meeting of the Whitby District Council, a letter was read from the Board of Trade with respect to the suggested extension of the line of the Whitby Electric Lighting Order, 1891. The letter stated that the Board would defer consideration of the question of making the Order for twelve months, but if at the expiration of that time no steps had been taken by the undertakers to give effect to their powers, the Board would not feel justified in allowing the Order to remain in force any longer.—The Chairman said they ought to take some steps, otherwise they would lose the Order, which cost them between £400 and £500 to obtain. There were two ways of avoiding this; one was to instal the light themselves, and the other to sell their Order to a company with the object of purchasing from them in years to come.—After a brief discussion it was decided to refer the matter to a committee.

It is proposed to establish at Oxford an institution to be known as Ruskin Hall, where working men may obtain the advantages of a university education. The chief promoters of the scheme are two American gentlemen, Mr. Charles Beard and Mr. W. Vrooman, non-collegiate members of the university, and they are being assisted by various friends. At a meeting of the Oxford Labour Council Mr. Beard explained the objects of the Hall; courses of lectures had been definitely arranged, and the intention was that they should be wholly for labouring men. They wanted to give an opportunity to men who had not money to take the regular university course.—A resolution approving of the objects and aims of the promoters was carried unanimously.

In excavating a sewer at Paris some few days ago on the south side of the Seine, the workmen came upon the fragments of an old wall about 36in. thick, built of solid blocks of stone, and evidently extending on either side under the houses of this densely-populated quarter. Archaeologists, after examining the structure, came to the conclusion that it might be part of the foundations of the Romano-Merovingian fortifications enclosing the ancient "Cité," and dating from the third or fourth century of our era. Remains of a precisely similar nature have also been found on the Eastern side. In the garden of Notre Dame, too, masonry has been laid bare, but it does not quite correspond in character to the previous discoveries.

THE next General Assembly at Burlington House, the first for this year, is fixed for Tuesday, January 31st. There are two notable items in the agenda—the filling up of the vacancies in the list of the Associates, and the election of an Honorary Foreign Academician. The latter is probably the more difficult problem of the two. The honour is great, and the number from amongst whom selection may be made very large. Of the five existing members three are French and two are German. But M. Gérôme and M. Menzel alone have a wide popularity, as distinguished from appre-

ciation, amongst their brethren. Originally all six members were French, the German element was a more recent innovation. It is "in the air" that there may be yet a more surprising innovation, and that amongst the names that will be submitted for choice will be that of an eminent American sculptor. The election of an Associate is for the general body of English artists a more interesting event, and on the 31st there are three to be chosen. One will probably be a sculptor—a sculptor is wanted for the schools.

AN interesting old Scottish church has just been reopened after undergoing restoration. This is the parish church of Bothwell, which was built in 1398, and used as a church from that time till 1830, when it was closed and the present new church was built. The movement for the restoration was begun about two years ago. The first work was to clear away from 2ft. to 3ft. of earth which, from the interments of centuries, had accumulated round the walls. The floor had also, to nearly the same depth, been filled up to make it correspond with the exterior. It was lowered to its original level. When this work was completed, it was found that the foundations and walls had a solidity that had not been known for several generations. The stone mullions of the windows, which had disappeared, were renewed. The carvings above the doorway, the sedilia, and the piscina were restored. The stone roof has been carefully preserved, and put into good order. Hitherto, the main entrance to the church has been by a narrow unattractive lane. This has been closed, and a new entrance formed direct from the street. Three blocks of houses have been removed, and the ground so cleared away has been laid down for trees, shrubs, and flowers, with intersecting walks. A house has been built for the church officer, and a conservatory erected for providing flowers for the grounds. The entire operations have been carried out under the direction of Dr. Rowand Anderson.

A MONUMENT has just been erected in the grounds of Bothwell Church to the memory of Joanna Baillie, the poetess, who was born in the manse of Bothwell. The monument is 16ft. in height. It rests on polished red granite. The material of the body of it is terra-cotta, with chastely ornamented figures. The distinctive feature of the monument is the filling of the four panels with mosaics. On the side fronting the street there is a portrait of Joanna Baillie. On another side is a reproduction of Horatio McCulloch's painting of Bothwell Castle. On the third there is a representation of the children of Bothwell in the early days of the poetess; and on the fourth are depicted the apple and plum trees of the valley of the Clyde. Below each of these descriptive letterpress is given in mosaics, including a reference to Joanna Baillie from Sir Walter Scott's "Marmion," and extracts from her writings recalling her early days in Bothwell.

SPEAKING of the elections to the Royal Academy that are to be made at the end of this month, the Globe remarks that one of the chief needs of the Academy is to increase the number of sculptors among the associates, and certainly there would be no excuse for deferring any longer the recognition of the claims of the younger school of sculpture. There are several men of very real capacity available now for election; and the difficulty will, rather be to make the most appropriate choice than to find a man worthy of selection. However, from the Acad my point of view, this will, perhaps, simplify matters, for with such an array of good candidates there is a certainty that a capable artist and a useful visitor for the schools will be secured, and there will be no need to go far afield in search of someone of the right type.

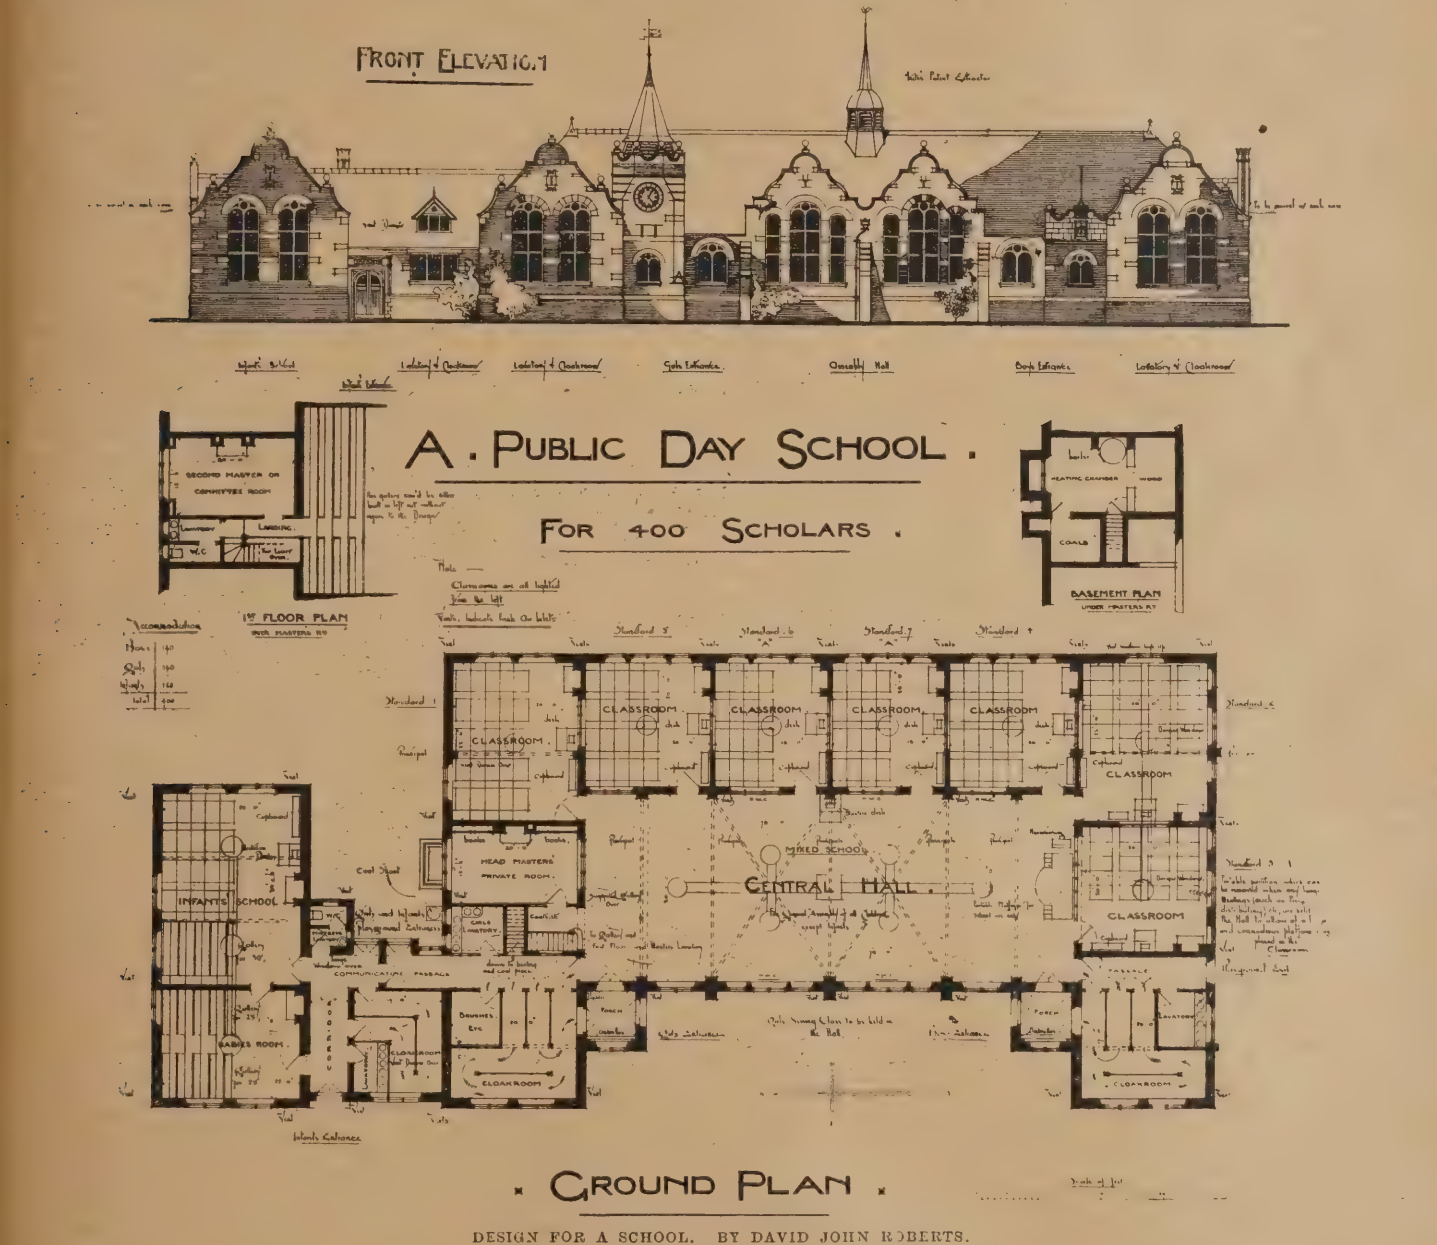

CANNOT something be done to prevent the complete disappearance of the picturesque buildings of old London? The improvement of the city inevitably demands the destruction or removal of many of these; we cannot ex-

pect that a house which has become an obstacle to the public health or convenience shall be spared simply because it presents curious architectural features or because it was the abode of a king or a highwayman. A suggestion, which has much to commend it, was recently made by a popular weekly contemporary to the effect that an old London street, formed from the actual buildings displaced by improvements, should be re-erected at the South Kensington museum or elsewhere. Another plan which would do something to preserve our ancient houses to memory if not to sight would be to adopt a similar scheme to that recently proposed to and accepted by the French Minister of Fine Arts. In future all ancient houses of note and architecturally interesting buildings in Paris, before being

limited to Architectural students under twenty-five years of age. The author proposed to use for the external walls. Ruabon best wire cut bricks, with Helsby stone dressings; and green slates 16 by 8 for roofs; bell turret to be covered with oak shingles, the windows generally to have 5in. by 3in. casement frames. The author is Mr. David John Roberts, Bangor, North Wales.

ON the subject of the smoke nuisance Dr. George Wyld makes the suggestion that the London County Council should buy up the gas companies. It would be possible for the Council, he thinks, to supply gas at about half its present price, and people could then cook their food by gas at half the cost of coals, and heat their houses, all things considered, at

artist, M. Verestchagin, illustrates Napoleon's disastrous Russian campaign. There is a grim realism about these pictures, which distinguishes them from the ordinary run of war pictures. Here there is nothing of the pomp and glory of war; you do not see the actual fighting, only the pathetic and pitiful scenes that belong to the retreat of a defeated army. The interest of these pictures is, perhaps, not chiefly artistic. Technically, they are no doubt open to serious criticisms, but they have a value that is all their own. One can well understand why Mr. W. T. Stead, who is just now devoting his energies to the crusade against war, should have chosen the Russian painter for the subject of his Character Sketch in the current number of the Review of Reviews. M. Verestchagin is one of the most

pulled down are to be carefully drawn, and ground plans taken, together with photos of the interior and exterior. We have no minister of Fine Arts, but we ought to have some public authority—the County Council perhaps—who would be willing to undertake so useful a duty.

THE design reproduced on this page was submitted in Competition at the Royal Welsh National Eisteddfod of Wales, held at Llan-dudno, North Wales, in the year 1896, and was awarded first prize by the assessor, Walter Higgingbottom, Esq., F.R.I.B.A., Manchester. The conditions were, to provide a Public Day School for 400 scholars (mixed), a proportionate number of infants included, cost not to exceed £12 per head, Competition

somewhat less than by the cost of the present wasteful use of coal. "If so," he adds, "the London County Council could enforce the use of smokeless fuel only." This seems a little inconsequent, but it is no doubt perfectly true that if this desirable result were achieved, "the value of house property would begin to rise, our health and comfort to increase, and the beauty and grandeur of our great city to be revealed. Those who have seen London from our bridges on a summer morning before the fires are lighted know what that revelation really is."

A REMARKABLE collection of pictures is now being exhibited at the Grafton Gallery. This is the series of paintings in which the Russian

powerful preachers in the cause of peace "Pictures like these," said the German Emperor on one occasion, "are our best guarantee against war."

A DEPUTATION from the Hanley School of Art Committee has waited upon the Corporation with respect to the present position and future prospects of the School of Art. The committee wished to obtain from the Council further financial assistance in carrying on the work of the School. They pointed out that the fittings in the School of Art buildings were out of date, and asked for a special grant of £100 to replace them. They also wished the annual grant from the Corporation to the School to be

largely increased. Further, the school buildings were at present too small for the work that had to be done in them, and though the committee has not decided on any scheme for providing increased accommodation, yet at no distant date they would have to ask the Council to make a further grant to enable them to extend the premises.—The Mayor promised that the matter should be brought before the proper committee.

THE Birmingham Municipal Art Gallery is to receive another gift of the late Sir Edward Burne-Jones' pictures. Mr. C. Fairfax Murray has offered four cartoons for the Lyndhurst windows—(1) Joshua, (2) Elijah's Sacrifice, (3) Peter Led from Prison, (4) The Stoning of Stephen; also (5) St. Edith Abbess and Queen, (6) Saints Cicely and Dorothy. This last is a cartoon for silk embroidery, and all six were executed by the firm of Morris and Co. And the two cartoons by William Morris, "Adoring Angels," which have been for some time in the gallery on loan.

As a tribute to the memory of Mr. C. N. Kennedy, an exhibition of his works has been organized at the Carlton Gallery in Pall Mall, where the lower room is now filled with subject pictures and the upper room with portraits. A great number of the pictures are studies of sea nymphs and other nude figures, often set against a background of blue sea; and in these the artist shows himself to be an accomplished draughtsman and gifted with a pleasant sense of form in composition as well as of colour.

PRINCESS LOUISE, Marchioness of Lorne, at Mercers' Hall made the annual distribution of prizes to the students of the Royal Female School of Art on the 17th inst. During the past year one hundred and sixteen students have received instruction in Art at the school, and in April last five hundred and seventy works were sent to South Kensington for examination and competition for awards. Two students of the school had been awarded National silver medals, while three had received National bronze medals. The Queen's Scholarship had been obtained, as also the Mercer's Scholarship and Queen's gold medal, the Clothworkers' Scholarship, the William Atkinson Scholarship, and the National Gilchrist Scholarship. The report on the Chromo-lithographic Art Studio was favourable as to work and progress.

THERE is great agitation among Italian artists owing to the formation at Venice of a corporation of Italian painters and sculptors, consisting of only fifty members, whose object is to obtain important privileges at national and international exhibitions in Italy and abroad. The chief of these claims is a demand for separate space to show collectively the works of the members of the corporation, while excluding those of other artists. By way of protest, an association of Italian painters and sculptors has been constituted for the purpose of helping young men showing a bent for Art, protecting the moral and material interests of the artists, and obtaining from the committees of the exhibitions in Italy and abroad the same privileges as are accorded to other Italian societies. The request of the Corporation for separate space in the Venice Art Exhibition of 1899 has been granted by the municipality, which, however, has reserved its decision respecting the application of the rival association. These curious claims and counter claims are causing much discussion in the artistic world.

A LARGE three-light painted memorial window has been added to St. George's Church, Perry Hill, London. It is the first of a series, each to represent three great Churchmen from different centuries. The figures represented in this first window are Archbishop Benson, of Canterbury; Bishop Patteson, the martyr Bishop of Melanesia; and Archbishop Alexander, Primate of All Ireland. The window was designed and executed by Messrs. Bacon Bros., of 11, Newman Street, London, W.

Professional Items.

CARDIFF.—A new chapel for the Bible Christian Connexion has been opened at Cardiff. The building is 60ft. by 38ft., and gives accommodation on the ground floor for 356 and in the galleries for 238 worshippers, exclusive of the choir, which will number about 30. There is a vestry and small library attached to the chapel, and behind is a schoolroom about 46ft. by 25ft. on the ground floor. There is another schoolroom of equal dimensions on the first floor. The internal arrangements are comfortable and attractive, and the chapel is well lighted with two handsome sun burners and wrought iron brackets. The contractors were Messrs. Knox and Wells, of Cardiff, who have carried out their work admirably, and in a most substantial manner, under the personal supervision of the architects, Messrs. Veall and Sant, who designed the buildings in the Early English style of Gothic architecture. The contract price for the whole was about £4100.

DERBY.—THE new Municipal Technical College was opened last Thursday. The building is a large extension of the School of Art. The work of extension was commenced two or three years ago. The building is of Gothic design, and covers an area of about 17,000 square feet. It is rectangular in plan, and has four elevations. The heating and ventilating is on the Plenum system, and has been carried out by Messrs. Ashwell and Nesbit, of Leicester. The floors are all fireproof, on the Dennett and Ingle system of concrete arches. The college will accommodate 1500. The cost of the whole building has been about £30,000. The architects are Messrs. Waller and Son, of Gloucester, and the contractor is Mr. Henry Vernon, of Derby.

DUBLIN.—The Central Hotel, Dublin, has been extended by the addition of special rooms for the exhibition of commercial travellers' stock. The structure forms a large block with a frontage of 117ft. along Dame Court, and is substantially constructed throughout. Both fronts are faced with Portmarnock red brick, having cut stone dressings. The contractors for the building work are Messrs. M. Meade and Son, of Great Brunswick Street. The building was designed and its erection superintended by the Hotel Company's architect, Mr. W. M. Mitchell, R.H.A., of 5 Leinster Street.

INVERNESS.—A new infant school is to be erected on the grounds of the High School, Inverness. The building, which presents a plain but artistic appearance, is to be one-storied. Two doors are to be provided—one for the boys and another for the girls—and these will lead into a large corridor. There will also be a corridor running up to the centre of the building, an infants' room for seating 150 children, six classrooms, a room for the headmistress, and a room for the other teachers. Every attention is to be paid to the ventilation, sanitation, and lighting of the new school. In short, the building will be erected on the most up-to-date principles. Mr. William Mackintosh, Academy Street, Inverness, is the architect, and the various contractors are: Masons, Messrs. William Alexander and Co.; carpenter, Alexander Anderson; slaters, Adam Taylor and Co.; plumber, Arthur Russell; plasterer, William McAndie; painter, Kenneth Chisholm; ironwork, Rose Street Foundry—all of Inverness.

A MONUMENT to Lafayette, the cost of which is to be defrayed by subscriptions raised among the school children of the United States, will be unveiled—if completed—at the Paris Exhibition on July 4th next year. The commission has been given to Herr Karl Bitter, an Austrian, and Mr. Paul Bartlett, for twenty-five years a resident in France; whereat American sculptors are, not unnaturally, somewhat annoyed.

Under Discussion.

JOHN RUSKIN AND HIS WORK.

The sixth of the fortnightly lectures on Art subjects in the Glasgow Art Galleries was delivered by Mr. James G. Borland, President of the Ruskin Society, who took for his subject "John Ruskin: His Personality and Influence." Dealing with the early life of Ruskin, the lecturer showed the influences hereditary and educational, which established those habits of close observation and accurate description which, when put into words, gave us the eloquent and poetic writings now so much admired. The startling evolution of the quiet student of nature into the revolutionary Art critic and passionate defender of the genius of Turner, through which he had given a fresh impulse to Art, was referred to; as also his later development from the Art critic into the social reformer and political economist, the result of a realised consciousness that no true Art was possible in a period and among a people governed by the materialistic ideals and evinced by the social conditions then prevailing. As showing the powerful influence of Ruskin upon the thought and life of this age, Mr. Borland pointed out that the economic and educational principles laid down in "Unto this Last" and other of his books, scouted and condemned at their first publication, were now shaping and dominating all that was best among the ideals of to-day. Among the practical pieces of social reform, either initiated or inspired by Ruskin, the lecturer referred to such movements as the better housing of the people, the establishment of public Art galleries and museums, the revival of village industries, the redemption of waste lands and such social missions as that of Toynbee Hall, as carrying out Ruskin's ideas of the responsibility of the well-to-do and cultured classes towards the masses of the people. The lecture was illustrated by a fine series of lantern slides of drawings by Mr. Ruskin and of the mosaics in St. Mark's, Venice.

AN INTERESTING ARCHÆOLOGICAL DISCOVERY.

Mr. W. A. Donnelly read a paper last week before the Glasgow Archæological Society on the Dumbuck Crannog or pile dwelling which was discovered by him on 31st July, 1898. The crannog, Mr. Donnelly said, was situated about 1800 yards from Dumbarton Castle, and was 50 yards from low water mark, and 250 yards from high water mark. The circle of it was 60ft. in diameter, and was bounded by 27 oaken piles, each nine to ten inches in diameter, and fixed into a blue clay bed. Among the articles found in it were a prehistoric ladder, a splendid specimen of a great war canoe, the work of stone implement, and resting in a finely constructed dock, a quern among the charred remains of what appeared to be roasted acorns, and the remains of probably the Caledonian ox and Caledonian wild boar. The structure had been pronounced a crannog by the most eminent authorities. The environment and accessories of the crannog pointed to a pre-Roman period.—In the discussion which followed Mr. Neilson expressed the opinion that this crannog was one of the most important archæological discoveries of recent years.—The Chairman, Dr. David Murray, in closing the discussion, said that there was no doubt Mr. Donnelly had discovered an ancient structure of great interest. The shale article were to him a proof of the genuineness of the discovery. As to age, he would be inclined to say that the discovery belonged to the period of the Roman occupation, or even later.

THE BACTERIAL TREATMENT OF SEWAGE

A lecture on this subject was delivered before the Society of Arts on January 16th by Dr. Samuel Rideal. After an interesting historical review of the methods adopted at various times for the disposal of sewage, Dr. Rideal explained that recent experience has shown that the chief agent in the purification of these fou

liquors is the action brought about by the minute organisms which are always present in such solutions, and which under suitable conditions thrive and multiply, and, when the filtration is not too rapid, are capable of producing an effluent which can be run direct into rivers without detriment to health. These changes are both anaerobic and aerobic. In the sewers themselves the anaerobic changes go on in the dark, the sewage being acted upon by germs which work there in the absence of oxygen, and whose life work consists in the conversion of organic nitrogen and carbon into ammonia and carbonic acid. The aerobic germs then take up the running in the presence of air, and effect the conversion of the ammonia into nitric and nitrous acids, both of these acids in combination with inorganic bases, such as lime, being absolutely harmless in water. The filtration is usually carried out in concrete-lined tanks filled with clinker or coke breeze to the depth of about three feet, the effluent after standing being then run through a second finer filter. The sewage is brought into contact with the bacteria in these beds or filters, and it is found practically that within limits the more the beds are worked the more efficient they become, when they have once got into a proper working condition.

THE PROGRESS OF ELECTRICITY.

At the monthly dinner of the London Chamber of Commerce held at the Trocadero Restaurant last evening, when the subject of discussion was "The Progress of Electricity," Mr. T. F. Blackwell, chairman of the council of the chamber, presided.—The Chairman, in introducing the subject, referred to the proposal for an all-British cable. The idea, he said, was worth serious consideration. It was evident that, in certain circumstances, it would be of the utmost importance that we should have full and entire control of our cables. It was very desirable, he thought, that the telephone should be under the control and management of the State rather than of a private company. Legislation, he thought, had very much hindered progress in the matter of electric lighting. He was glad to see that electric traction was coming rapidly to the front. Its general adoption would be an immense convenience to Londoners.—Mr. S. Morse, chairman of the Electrical Trades Section of the chamber, referred to the fact that there were now some £11,000,000 invested in supply companies or in local authorities undertaking the supply of electric lighting throughout the country. This he said, was an indication of the great progress that had been made in spite of all difficulties, and of the enormous proportions to which the enterprise had grown.—Major-General Webber argued against the idea that State control of the telephone system was a desirable thing. In all those countries, he said, where nationalisation had taken place, the progress had not been so great as in the countries where the telephone industry had been carried on and managed locally.—Mr. E. Garcke said it was no use lulling themselves into the belief that they had cause to be satisfied with the progress of electricity in this country. If they compared the history and progress of the science here with its history and progress in other countries, they had to deplore the fact that they were, even to-day, many years behind almost every civilised nation of the world. He believed the primary cause of this was the tendency towards municipalisation which had been characteristic of recent years. It was impossible for private enterprise, under these conditions, to make that headway which was absolutely necessary for the development of the industry. Almost every department of electricity had suffered from the same cause. He differed from many authorities in thinking that the telephone service in this country was quite as satisfactory as the service in America or on the Continent. As to electric traction, he believed that if they made the mistake of encouraging the municipalisation of tramways they would retard the progress of the electrical industry.

Enquiry Department.

In reply to H. F. B. (Kennington Park Road), for particulars of the examinations of the Society of Architects, application should be made to the Secretary of the Society, St. James' Hall, Piccadilly.

BOOK ON SURVEYING, AND SURVEYING INSTRUMENTS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I shall be much obliged if you will inform me which you consider the most satisfactory and complete work on Surveying and Surveying Instruments.—Yours, &c.,
"ALPHA."

New Brompton.

We assume that your question refers to a book on surveying works connected with Architecture. In that case, either Ainslie's "Comprehensive Treatise on Land Surveying," or Castle's "Treatise on Land Surveying and Levelling," should give you what you want. A standard work on the whole subject is Johnson's "Theory and Practice of Surveying." You should not buy these books without satisfying yourself that they meet your want.

POSTS FOR PROTECTING A FOUNTAIN.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Could you kindly inform me through your Enquiry Column about the cost and method of fixing large posts to protect a fountain?—Yours truly,
E. O.

You do not say of what material the posts are to be made. If of iron or stone, any ironmonger or stonemason, as the case may be, would give an estimate. If of gun-metal, apply to Baker and Co., Westgate, Newport, Mon. Fix with a pick and shovel.

FIXING GLASS IN STONE MULLIONED WINDOWS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—On page clxx in your issue of Jan. 4th, reference is made to the "fixing of glass in stone mullioned windows by screwing oak fillets to lead plugs let into the stone."

I shall be much obliged if you will give me further details with regard to the following points:—

(1) Would ordinary lead run into the stone to form plugs, allow a screw to be driven home easily?

(2) Should not the glass be bedded in something to exclude the weather between the stone and glass; if so, what would be best?

(3) Supposing now the inside of the mullions and transoms are to be cased with wood, and the glass inserted into wood frames, what would be the best method to "secure the frames to the stonework," also the linings to same?—Yours truly,
A. L. R.

Loughborough.

In reply to A. L. R.'s first question, a lead plug will certainly allow of a screw being driven into it; this is the usual method of fixing casements to stonework. My answer to the second question is to bed the glass in white lead where it rests against the stone. As to the third query, I have never seen stone mullions cased with wood linings, and should be sorry to have to do such a thing. But if double hung sash windows with stone mullions are required, the mullions should stand in front of the cased frame with a straight joint between the two, and this might be pointed up with a mixture of cement and mortar. Such a window would have 9in. reveals, and the mullions and transoms should be not less than 9in. by 6in., and of a square or slightly bevelled section. Deep meeting rails should be arranged behind the stone transoms.

J. E. NEWBERRY.

PUBLICATIONS FOR WOOD CARVERS.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Would you kindly advise me, through your Enquiry Department, of the name and price of a paper, weekly or monthly, which treats of wood-carving? Also what

books on the subject you can recommend, to one not exactly a beginner?—Yours truly,
"A CARVER."

Glasgow.

"Work," published by Cassell and Co. at a penny weekly, frequently contains wood-carving designs. The editor of that journal would tell you the numbers in which designs appear. We do not know any periodical devoted wholly or chiefly to wood-carving. A book that would probably meet your requirements is "A Manual of Wood-Carving," by W. Bemrose, price 5s., published by Bemrose and Sons, 23, Old Bailey, E.C. "Wood-Carving for Amateurs," published by Gill, 170, Strand, London, W.C., is a shilling handbook of a more elementary character.

Correspondence.

SOME TENDENCIES IN ART AND ARCHITECTURE.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Some thoughts suggested to me by the brilliant address delivered not long ago by Mr. H. Wilson, and reported at length in your paper, may possibly seem to deserve the little space they require, and are therefore committed to paper and posted. What one speaker said was repeated by others with only some slight variations:—"They could not," said they, "put up a great building and allow every craftsman to do as he pleased with it. The result of such a way of proceeding would be the Architecture would be left out, and the building made up of a number of pieces of craftsmanship which, although of themselves interesting, would be entirely separate, bearing no relation to each other." There was more to the same effect, but we have enough here for the purpose, and it will, I think, be agreed that all such speeches as these are indicative of an entire misunderstanding, for no man in his senses could desire to see art workers and architects standing further apart than at present. It is certain that Mr. Wilson does not, and to me it appears that there was hope for the future of art in almost every word of the speaker's address.

"The architect has," said one speaker, "a commercially-minded people to deal with; if an economic building is wanted the architect has to produce it; if he refuses or fails then he is left in the lurch with his ideals in his head, and naught else." The quotation is as nearly correct as need be, and under such conditions it would indeed seem that for the body to thrive the art must be starved. But the speaker referred to things as they are at the moment, without so much as a word with regard to what may be.

The tendency of all education, unless, indeed, we are wasting our millions, is to create a demand for genuine work which in the fullness of time must effect a change in all trades whatsoever. The generations to come will owe to their forbears an instructive perception of quality whereby they will be enabled to form an opinion as to an architect's worth with as little hesitation as is shown nowadays in the selection or rejection of foods.

There was a reference in one of the speeches to William of Wyckham: the speaker could not believe that he, the said William, was ever a workman himself. Still harder would it be to believe that, being a bishop and a great many things besides, he was anything even remotely resembling the modern professional architect. If there has been anyone comparable with him in our generation, allowing for every difference, it surely was William Morris with "his splendid capacity for planning and seeing what was right in other men's work." That the like of such men as the two above-mentioned will never be seen again may be regarded perhaps as certain; but the age will be evil indeed that cannot produce a master mind, one whom it may acknowledge as a superior. The architect's place is of course in the ranks with designers and craftsmen in general, the master's mind being over all.—Yours truly,
E. RADFORD.

Views and Reviews.

THE ROMANCE OF GLASS-MAKING.

A review of a book which is in itself but a resume of as much as is known of the subject can hardly be anything more than a simple appreciation, and nothing more in this case will be offered. "This little book," says the author, "has been designed to supply such information as is likely to be useful to the general reader," and it admirably serves its purpose. The author's style, and the evident breadth of his views, make the volume most agreeable reading. The points of contact are many between the history of any one art and of the others, consequently a treatise on glass can hardly fail to interest many besides those engaged in the business. What the general reader should know of the subject will be found all ready to hand in the earlier chapters which tell of Persian, Phœnician, Egyptian, Grecian, Roman, Byzantine, and Saracenic glass and glass makers. "Venetian taste," says the writer, "seems to have run towards the bizarre; the very facility of the ware, or rather the dexterity of the artist, to have prompted an indulgence in the extravagant and grotesque, which is not always justified by the artistic result."

The necessity of using coal instead of wood for fuel led to the introduction of melting pots closed at the top, and this in turn may have led "to the large proportion of oxide of lead that came to be used as a constituent of the glass; flint-glass or crystal being the name given to this description." The invention heralded a new epoch fraught with fresh possibilities of achievement and mischief; for, as the author rather curiously expresses it, "at the commencement of this century cut-glass was rampant." Now nothing is easier to mould, we are told, than a lumpy and expensive example of cut-glass, and the manufacturer said to himself: "The great public wants to have cut-glass; it is costly and difficult to make, takes long to do, and none but a skilled hand can do it, so let a model be made of a piece with plenty of cutting upon it. Mould this; press out hundreds of pieces like it, and there you are—cut-glass, cheap and nasty!"

Particularly interesting, in view of what is now being done in England is the account of mosaic, and the distinction to which attention is drawn between the popular and the true method of conducting the work. One knows very well that the æsthetic value of the performance surpasses by far whatever value it has when regarded as a realistic representation of the particular scene depicted. The appearance of reality so easily gained by the painter would spoil the effect of the work. "Let the tessaræ be set in roughly as regards levels, so that the light sparkles from the varying facets." The old way to which Sir W. B. Richmond returns is thought to be better by far than that introduced by Dr. Salvitti of working the mosaic upside down upon paper, so that what meets the eye is hardly less smooth than a mahogany table, and comparable with nothing but painting.

"Romance of Glass Making" By Walter Gandy. London: T. W. Partridge and Co.

THE CATHEDRAL CHURCH OF SOUTHWELL.

We have reviewed from time to time several volumes of Bell's Cathedral Series, and now there comes to us yet another—Southwell. Since noticing the previous volume, the world of art has had the great misfortune to lose one of the editors of this series, the late Mr. Gleeson White. The fact that he could find time to act as co-editor of these books is yet another proof of his many-sided activity.

The chief interest of this particular volume centres, perhaps, in the pages that deal with the famous Chapter House, with its dainty sculpture. This is well illustrated by some charming photographs, although exception might be taken to the view of the entrance doorway, which shows a most unhappy effect of distorted perspective. This same effect is felt, though in a less degree, in the view of the north arcade of nave.

Another charming feature of this building is the north porch, which shows us a delightful effect obtained by the simplest means.

The hand of the restorer has been laid somewhat heavily on this church, and the author is at some pains to justify his doings. This, however, is a controversial matter, into

which we need not enter. It is preferable to turn to much that is of peculiar interest in the history of the building, and in that of the See, which is clearly and pleasantly related.

As to the general scope of this book, and the care and intelligence with which it has been prepared, we need only say that it well maintains the general standard of the series.

"The Cathedral Church of Southwell," by the Rev. Arthur Dimock, M.A. London: George Bell and Sons, 1898.

KEYSTONES.

A NEW patent watercooler has been fitted up by Messrs. Malcom, Ogilvie and Company at the millpond Constable Works, Dundee. The apparatus has been erected by Clie's Patent Engineering Company, Manchester. The main object of the invention is to enclose the vapour until it returns to water, and then discharge the water at such a temperature as to prevent it giving off further steam. The cooler at Constable Works has more than realised expectations. Under the most adverse conditions, only a few vapoury rings hover round the top of the cooler.

THE ruins of Inverugie Castle, near Peterhead, the ancient seat of the Earls Marischal, have been demolished by dynamite. A part of the ruins fell last Sunday week during the storm of wind and rain, and, as the remains of the castle stood in close proximity to a much frequented public road, it was thought advisable to demolish the remaining portion in case of accident to passers-by. Considering that the castle is nearly 600 years old, and that it is considerably more than a century since it was occupied, it was until recently in a fairly good state of preservation, and with a little expenditure could have been maintained, for many years to come, the prominent landmark which it was.

THE London County Council cannot find an architect to fill the place of Mr. T. Blashill, their superintending architect, who was to have retired at the end of last year. Advertisements were issued in November inviting applications for the appointment, which carries with it a salary of £1500 a year. In response twenty-seven applications were received, but the General Purposes Committee, before whom the applications came, reported that in their opinion none of the candidates possessed the qualifications necessary for so important a post. Accordingly they have persuaded Mr. Blashill to postpone his retirement until such a time as a suitable successor could be appointed.

TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

BECKENHAM.—For making-up Border-crescent, for the Urban District Council. Mr. J. A. Angell, surveyor, District Council Offices, Beckenham:—

T. Adams	£1,612 5 6	E. Iles	£1,271 8 0
G. Wilson	1,363 0 0	Mowlem and Co.	1,250 0 0
BRIDLINGTON. —For the erection of four houses, Horsforth-avenue, for Mr. Stager. Mr. J. Barnshaw, architect, Wellington-road, Bridlington Quay:—

Norwich,
January 16th, 1899.

HORNSEY URBAN DISTRICT COUNCIL.

TO ROAD AND SEWER CONTRACTORS.

The Hornsey Urban District Council are prepared to receive TENDERS for the following WORKS, namely:—

1. (A) The Construction of about 2100ft. run of 9in. Stoneware Pipe Sewer and Surface Water Sewer in Great North-road, Highgate, with manholes, &c.

(B) About 950ft. run of 9in. Stoneware Pipe Surface Water Sewer, with manholes, &c. in Muswell Hill-road, Highgate.

(C) Works of Widening, Kerbing, Channelling, Paving, and improvement in Church-road, Highgate.

2. The Sewering, Levelling, Paving, Metalling, Channelling, and Making Good of Prince's-avenue, Muswell Hill, situate within the District of Hornsey.

Plans and specifications may be seen, and forms of Tender and all information obtained, on application to Mr. E. J. LOVEGROVE, Engineer to the Council, at the Offices mentioned below, on any morning between the hours of TEN and TWELVE o'clock, on a sum of Two Pounds being deposited with the Clerk to the

Council for each separate Tender, which sum will be retained by the Council and deemed to be forfeited if a bona-fide Tender is not made by the depositor.

If a Tender is made which is not accepted, the sum deposited will be returned, and if a Tender is accepted such sum will be retained by the Council until the contract has been executed by the depositor, and will be forfeited in the event of his or his sureties failing or neglecting to execute such contract, or the bond accompanying same, within seven days after he or they respectively shall have been requested to execute the same.

No Tender will be considered except on the prescribed form.

Sealed and endorsed Tenders are to be deposited in the Tender box in my department not later than FOUR o'clock p.m. on Monday, JANUARY 30th.

The Council reserve to themselves the right to decline all, or any, or any portion, of the Tenders sent in.

By order,

F. D. ASKEY,

Clerk to the District Council.

Offices: Southwood-lane,
Highgate, N.
January 4th, 1899.

BOROUGH of BOOTLE.

TO BUILDERS AND CONTRACTORS.

The Corporation of Bootle are prepared to receive TENDERS for the ERECTION of a TECHNICAL SCHOOL on land in Balliol-road, according to plans and specifications prepared by Messrs. BEST and CALLON, Victoria-street, Westminster.

The plans and specifications may be seen at the Office of the Quantity Surveyor, Mr. EDWARD REID, 7, Westminster-chambers, Crosshall-street, Liverpool, and copies of the quantities may be obtained at my office on payment of Two Guineas, which will be returned on receipt of a bona-fide Tender.

The person whose Tender may be accepted will be required to enter into a contract, with sufficient security, containing clauses as to the payment of the standard rate of wages and the observance of the recog-

nised hours of labour in the trades engaged in carrying out the contract.

Tenders, sealed and endorsed "Tender for Technical School," to be addressed to the Free Library and Museum Committee, and delivered at the Town Hall not later than FIVE p.m. on WEDNESDAY, FEBRUARY 1st next.

The lowest or any Tender will not necessarily be accepted.

J. H. FARMER, Town Clerk.

Town Clerk's Office, Bootle,

January 11th, 1899.

VESTRY of ST. MARY, NEWINGTON.

TO CONTRACTORS AND OTHERS.

The Vestry of the above Parish invite TENDERS from persons willing to Contract for the SUPPLY of ROAD MATERIALS and ARTICLES hereinafter enumerated for one year, ending March 25th, 1900.

1. York Paving, Granite Pitchings, Kerbing, &c.
2. Broken Guernsey Granite.
3. Thames Ballast and Sand.
4. Lime and Cement.
5. Ironwork.
6. Ironmongery.
7. Drainpipes.
8. Timber.
9. Scavengers' Brooms.
10. Oils, &c.

Contractors will be required to sign the following declaration:—"We hereby declare that we pay to the

INTRODUCTION OF NON-FLAMMABLE WOOD
INTO EUROPE.

The British Non-Flammable Wood Co. Ltd.

Beg to announce that their Works in London, the first erected in Europe, are now completed, and they are prepared to
Take Orders for the supply of "NON-FLAMMABLE WOOD" in large quantities.

"NON-FLAMMABLE WOOD," as produced by the Company's process, is now in use on the following
UNITED STATES WAR VESSELS:—
BATTLESHIPS.—"IOWA" and "OREGON." MONITOR.—"MIANOT." CRUISERS.—"BROOKLYN," "CHICAGO."
GUNBOATS.—"HELENA," "WILMINGTON," "NASHVILLE," "ANNAPOLIS," "WHEELING," "MARIETTA," "NEWPORT," "VICKSBURG."
And is being used for the Battleships "KEARSAGE," "KENTUCKY," "ALABAMA," "WISCONSIN," and "ILLINOIS," now being built.
"NON-FLAMMABLE WOOD" has also been used for all the Carpentry and Joinery Work in the following well-known
colossal Buildings in New York:—
THE COMMERCIAL CABLE BUILDING, THE QUEEN'S INSURANCE BUILDING, and THE R.G. DUN BUILDING,
(each of which is over eighteen stories high).
"NON-FLAMMABLE WOOD" has been tested by H.M. Admiralty, and Large Orders have been given to the Company
by the Government.

Quotations will be furnished on receipt of Specifications.
Address all applications to the General Manager,
BRITISH NON-FLAMMABLE WOOD CO. Limited,
2, Army and Navy Mansions, Victoria Street, London, S.W.

PARIS ABATTOIRS. FIG. 36.

PARIS ABATTOIRS.

By R. STEPHEN AYLING, A.R.I.B.A.

(Concluded from page clvi.)

ABATTOIR FOR PIGS.

THIS is the only portion at present in use, although the abattoirs for sheep and oxen are practically completed. Owing to the inequalities of the site, the portions both for pigs and horses are placed on a terrace about 16 or 17 feet above the general level, and are approached by sloping roads at S.S. The entrance is in the Rue Dantzic at T, and consists of two carriage and two side gates. To the right and left of this entrance are pavilions, V U, the former for the caretaker and the latter for the octroi. Between the large gates is a covered weighing-house. Adjoining the above pavilions are ranges of retiring and cloak rooms, W W, with sanitary conveniences. At X X X are two long ranges of porcheries (stables for pigs), Fig. 36, divided into twenty-seven pens, and capable of holding 1200 animals. The buildings are in brick and stone with tile roofs. Between the two ranges of porcheries is a large open courtyard, Y, with two sloping platforms for the animals to dismount from the carts bringing them to the stables. Connected to the above by a short passage is the bruloir, Z, the killing and burning house. This is divided into eight parts by dwarf brick walls, as at La Villette. The animals are driven into one of the divisions to the number of six or eight, are then killed, and the hair burnt off them. This building has four large ventilators in the roof for carrying off the smoke occasioned by this work. The planning of this portion is certainly not so good as that for the sheep and oxen, where each animal is killed out of sight of the others. A short covered passage, a, with "boyandiers," b (workrooms), on either side, connect the bruloir to the "pendoir," c, and the "degressoirs," d. The former is a large building used for scraping and preparing the carcasses of the pigs. The "degressoirs" (rooms for preparing intestines) are ranged on one side of the "pendoir," and are fitted with troughs and work tables. On either side of the "bruloir" are large open courts with conveniences for men and women, e and f, and a range of "boyandiers" at g. A long building for the storage of fodder and litter is placed parallel to the railway at h. An additional entrance, i, with offices for the octroi is provided at the extremity of the site, from the Rue de Dantzic, for animals coming on foot or in carts. On the lower level is a large courtyard, k, for manure, and at l an open arcade supporting reservoirs over.

Adjoining the railway at n is the disembarking stage for animals brought by train, and in connection with it is the "parc de comptage," m, or counting barriers. The

arrangement of these is similar to those at La Villette, being in wood with lozenge-shaped recesses in which the men stand to count the animals. The central portion is covered by a wooden roof.

ABATTOIR FOR HORSES.

It is proposed eventually to erect the abattoir for horses on the elevated portion of the site adjoining the railway.

The buildings will consist of—o, octroi; p, caretaker; q, sanitary inspector's office; r, condemned meat; s, echaudoirs with lofts over and court in centre; t, stables with lofts over; u, tripery; v, open court approached by sloping road.

As will be seen from the photo illustrations, the whole of the buildings are treated simply and are excellent in design. By a judicious use of the materials employed, Mons. Moreau has obtained an effect which compels admiration. It is a striking illustration of the way in which strictly utilitarian buildings can be made not only expressive of their use, but at the same time excellent examples of architecture.

At the Sanitary Congress recently held at Birmingham, Mr. E. Parkes, M.P., read a paper on "Municipal Authorities and Public Slaughter-houses," in the course of which he urged that the existence of private slaughter-houses, often in a very insanitary condition and in the midst of a dense population, constituted a great source of danger. Unfortunately, at present, Parliament is unable to cope with the evil, but it is to be hoped that the report of the Royal Commission will have the effect of the matter being given careful attention. We have recently lost one of the most enthusiastic champions of the abattoir movement in the death of Sir Benjamin Ward Richardson. It is, perhaps, not widely known that he was president of a small society known as the "London Model Abattoir Society," the object of which was not only to secure sanitary conditions in these buildings, but less cruelty and pain to the animals about to be slaughtered. Herewith I append a few extracts from a pamphlet issued by this society, in which it will be seen how greatly advanced are our Continental neighbours in the humane side of the question.

"In Germany the majority of abattoirs are built and administered by the town parishes—very few of them by the Butchers' Guilds. With very few exceptions they are presided over by a certificated veterinary surgeon, who generally has also the charge of examining the meat. In most parts of the German Empire there have been regulations issued to prevent cruelty, by stunning all animals before the bleeding. In a great many of the slaughter-houses cattle are killed by means of masks, some of them arranged for shooting, but most of them by means of the hammer or the axe."

In Paris "the inspection of meat is entrusted to veterinary doctors, appointed after severe competition. They are under the jurisdiction

of the Prefecture of Police, which sees with jealous care to the strict application of the laws and regulations. Animals intended for food are visited and inspected, without any exception, before, during, and after slaughter. No meat can be introduced into Paris without having in the first place been stamped by the inspectors of butchery."

In conclusion, one can only hope that within the next few years, the abattoir system will become as general in England as on the Continent, that trade opposition will be successfully overcome, and that the slaughtering of cattle will be conducted under humane and sanitary conditions.

PRACTICAL CARPENTRY AND JOINERY.

By GEORGE ELLIS.

XII.—SHAPED OR CURVED WORK.

(Continued from page civ.)

THE methods used in the construction of curved surfaces in joinery may be classified under five heads, viz., bending in the solid by the aid of steam or moist heat; bending veneers by dry heat; cutting out in the solid; building up in sections; bending in the solid by kerfing. Of these, undoubtedly the first method is the best in regard to appearance and strength, as to bend the piece in its

FIG. 180.

FIG. 181.

DRUM FOR BENDING STEAMED WOOD.

entirety will ensure continuity of fibre and regularity of surface. But this process, if applied to stuff of considerable substance, necessitates a somewhat more extensive plant, and consequent space than is available in the average builder's workshop. Where, however, steam is at hand, a steam chest suitable for the manipulation of stuff of small scantling, say up to 2 in. thick, may be constructed without much trouble, of $\frac{1}{2}$ in. iron plate riveted to $1\frac{1}{2}$ in. internal angle pieces; about 10 ft. long by 10 in. square will be found a useful size. The door should be at the opposite end to the supply pipe, and be easily accessible; it should be of stout iron plate, hinged at the bottom. Two ears, bolted to the sides, provide key-

FIG. 182. A "BUILT-UP," CURVED IN LENGTH.

way for a cotter to secure it to its seating, which should be of rubber. The chest should be given a fall of 2 in., and a waste pipe should be provided at the lower end; a blow-off cock near the door and several cross bearers of deal, with waterways cut through, should be placed

FIG. 183. A "BUILT-UP," CURVED IN WIDTH.

at the bottom to keep the material free from the water.

The wood to be bent must be placed in the chest and the steam turned on for a time, dependent upon the sectional area of the piece treated, and the initial heat of the steam. If it is merely exhaust steam, double the time will be required to that for high pressure steam; in this latter case a quarter of an hour may be allowed for each square inch of section in hard wood, and a little less for soft wood; this will give sufficient time for the wood to become thoroughly permeated with the steam and rendered very pliable; longer than this will impair its strength, by dissolving the cell walls in the softer parts. A drum similar to Figs. 180 and 181 should be prepared, of somewhat quicker sweeps than is required for the work in hand, to compensate for the slight springing open that always occurs when the stuff is released; this drum is provided with a saddle lever working on the centre of the curve, and carrying a small adjustable roller between its arms, arranged to keep the work pressed tightly to the periphery of the drum. The piece to be treated is taken quickly from the steam chest, one end is secured by a handscrew to the drum, as shewn in the sketch, a length of galvanised hoop iron is then introduced between the material and the roller, and the lever is brought round steadily, and not too rapidly; for if the fibres are stretched suddenly they will rupture. When the end of the piece has been reached, the lever should be secured in position with a handscrew, and left for several hours for the piece to get set to the shape; and this may be further assisted by filling the pores on the convex side with hot glue. Any moulding, such as a bead, that does not differ greatly in the thickness of its parts, may be worked in the straight, and then bent;

FIG. 184. A "BUILT-UP," CURVED IN WIDTH.

FIG. 185. SOFTWOOD "CORE," VENEERED.

but otherwise, the safer plan is to bend first and work afterwards.

The next best and most economical method of obtaining curves of complex flexure or where the desired piece is of considerable width is by the "building up" process. This consists of the cutting of comparatively narrow pieces, to the required curve, or portions thereof, and fastening them together, over each other by means of glue and screws as shewn in Fig. 182. The heading joints may be made either butt or bevelled; the latter makes the stronger work, but in either case they should be ploughed and cross tongued. So far as possible, the grain of the rings should be crossed in direction, but the pieces composing each ring should run in the same direction, more especially at the butt joints where shrinkage will be most apparent. Two methods of building up work curved in the direction of its width are given in Figs. 183 and 184. The former is the more likely to keep its true shape after working, but the numerous joints are a possible source of weakness. Some of the material might be saved by cutting the planks down the middle with a bevel cut approximating to the curve.

In such work that has to be polished or varnished, the many joints, and crosscut grain, inseparable from these methods, prove serious blemishes in its finished appearance, and in these cases the *veneer* method is usually adopted. This is illustrated in Fig. 185. It consists of a core of non-resinous wood, such as American pine or Basswood, thoroughly dried, built up accurately to the curve, gauged to a suitable thickness, then sized, toothed, and veneered. If the veneer is of the "knife-cut" description, which is about $\frac{1}{16}$ in. thick, and is confined to the more valuable woods, it will be laid with the veneering hammer. This tool, of which a sketch is given in Fig. 186A, consists of a stout piece of steel with a rounded edge about 5 in. long by 3 in. wide, mounted in a deal headstock, with a short stout handle, set at an angle with the head of about 98 deg. It is used as follows: The veneer having been cut a trifle larger all round than the core, is toothed on the back, then wetted on the face with hot water, to counteract the swelling caused by the application of the glue to the back. The face of the core and the back of the veneer are then rapidly covered with boiling glue, the veneer is placed in position, and the superfluous glue squeezed out with the hammer. This is accomplished by rapid and heavy scraping strokes, from the centre towards the outsides of the veneer, the blade of the hammer being kept well soaked in hot soapy water during the operation.

"Saw-cut" veneers vary from $\frac{1}{16}$ in. to $\frac{1}{4}$ in. in thickness, and are much to be preferred to "knife-cut" as giving more substance for working and wear. These are laid by first steaming, or well wetting them in boiling water, then floating in glue, and fixing in position with handscrews, placed as closely together as possible. If the contours of the piece do not lend themselves to the application of handscrews, a caul, or reverse of the curve is made, and heated by gas or fire; its surface is then oiled and applied to the veneer, where it is firmly fixed with cramps or wedges, whichever proves more convenient, until the glue is dry.

Another method of forming a veneered curved surface has been referred to in the article upon Stairs in a previous number; that of *Staving* which may be briefly described as the backing of a veneer previously bent upon a "cylinder" with narrow staves in a cross direction; its application to a Soft lining is shewn in Fig. 186.

Kerfing is a very inferior method of obtaining a curved surface, and should only be used for unimportant work, that has to be painted; it consists in running a number of saw cuts nearly through the piece to be bent, on its concave side, filling the cuts with glue, and then bending the stuff to the sweep, and nailing it in position. Of course the curve is formed very crudely by a series of short facets, which are brought to something like a regular curve with glass-paper; but the marks of the cuts can seldom be entirely obliterated. A method of bending a bead or similar moulding, used by

the writer, may be found of service; a piece of stuff of the required width is cut in the direction of its length into a number of thin strips about an eighth of an inch in thickness; these are bradded or screwed together from the back, the edge is worked to the desired section, the pieces are then separated, and glued singly in position, and when dry any slight irregularity is removed with glass-paper.

(To be concluded.)

THE London United Tramways Company seek power to work their tramways in Surrey by mechanical power over the whole of their

FIG. 186A. A VENEERING HAMMER.

FIG. 186. METHOD OF STAVING A VENEER.

existing or authorised system, including the tramways of the Company in the County of London.

HAVANA is already starting on the work of improvement. The Municipal Council has approved the expenditure of £2,400,000 for sewage and paving, the contract having been given to a former chairman of the Republican Campaign Committee of Brooklyn.

THE Local Government Board, in reference to the application by Truro Rural District Council for sanction to borrow £5000, since increased to £5150, for works of water supply at St. Agnes, have informed that authority that the side wall of the two service tanks must not rest on the concrete floors as proposed, but must have independent foundations carried below the floor level. The Board also require that the pumping machinery be provided in duplicate. An amended plan is to be submitted with the necessary alterations.

A LOCAL GOVERNMENT BOARD inquiry took place at Manchester respecting the application of the Corporation for power to borrow £160,000 for purposes of sewerage and sewage disposal. The sewage of the city amounts to about twenty-three millions of gallons a day, and at the present time it is treated chemically and the effluent runs into the Ship Canal. Of late, experiments have been conducted for the Corporation by sanitary experts with a view to discovering a more effective system, and they advise bacterial purification by means of contact beds. The Corporation desire to establish that system, and the money sought to be borrowed is to construct the necessary works for carrying it out. After the hearing of expert evidence, the enquiry was adjourned for three months to allow of plans and sections being prepared and further experiments being made.

THE PLASTERERS' STRIKE.

SERIOUS CRISIS IN THE BUILDING TRADE.

A TRIFLING dispute which has arisen between a few London plasterers and their employers threatens to have very serious consequences for the building trade generally. On January 9th about 140 plasterers struck against the employment of non-union foremen. The firms involved are Messrs. Higgs and Hill, Messrs. Bywater, and Veronese Limited. These are not particularly bad firms from the workman's point of view; on the contrary, the Labour correspondent of the Daily Chronicle declares that they are noted as the three best shops in London, where the men have always received the best treatment and where the conditions of work have always been the fairest. Their only offence is that they employ foremen who are not members of the Plasterers' Union. What makes the demands of the men the more unreasonable is that by the rules of their society foremen are not allowed to take any part in the business of their branch.

All the men who left their work (with the exception of ten engaged as pickets) at once obtained employment elsewhere. But the serious element in the situation lies in the fear that the masters may retaliate by instituting a general lock-out, unless the men withdraw their demands. There have been rumours for some time past of the existence of a gigantic federation of employers having for its object the smashing of trade unions, and it is further stated that the boiler makers and the plasterers are the two unions specially marked out for attack. On the other hand, Mr. T. Costigan, the Secretary of the Master Builders' Association, said recently in the course of a press interview: "We have no desire to fight. We would gladly avoid it. The contest is being thrust upon us. In fact, we have already offered, some time ago, to form a joint conciliation board. The plasterers' union simply laugh at us. They will have nothing to do with it. They do not even come to discuss disputed points. In a word, their conduct has become so outrageous and intolerable that there is nothing for us but to take action. We are reluctant to do so, but there is really no help for it. The fight is being thrust upon us whether we like it or not." We hope this represents the real mind of the majority of employers, and that there will be no attempt to meet the ill-advised action of a few hot-headed and irresponsible members of local branches by an act of aggression against thousands of trade unionists, who have no part nor lot in the foolish action of their fellow workmen. For nothing is clearer in connection with this strike than that it is brought about by the action of a few, and that it meets with the strongest disapproval, not only of employers and their organs, but of the great bulk of trade unionists, including a large number in the Plasterers' Union itself.

The opinion of Mr. John Burns, M.P., may be quoted as an example of the way the strike is condemned even by the friends of the workmen:—"If they won, he told the men, it would be worse for them in the long run. The best thing that could happen would be for them to withdraw from the dispute, as he was certain it did not command the support of the majority of the plasterers themselves, and from all he could gather it was not likely to receive the recognition of the kindred building trades. It was the opinion of many trade unionists that foremen ought not to be subject to the same rules as men. Given that the foreman question was worth fighting for, it was certain they ought not to go the length of a strike that would probably involve all the building trades in London in a long and bitter conflict.

There is not likely to be any fresh development until after the employers' meeting, which takes place this week. Meanwhile there is hope that the wiser members of the Plasterers' Union, who disapprove of the present course of action, may take steps to make their objections effective.

Surveying and Sanitary Notes.

At a recent meeting of the Linlithgow Commissioners a discussion took place on the proposed drainage scheme for the town. A deputation was appointed to see the agents for the trustees of the late Duke of Hamilton, on whose land it is proposed to construct sewage works. A difference of opinion has arisen as to whether the international system or the septic principle should be adopted in the treatment of the sewage.

An infectious diseases hospital is to be erected at Vineyard Hill, Over, near Gloucester. The site was some time ago purchased by the Council. The cost of the hospital building (a contract for which has been provisionally accepted) will be £9588; roads and improvements to the estate bring the amount up to £13,634. It was estimated that the furniture, &c., would cost £1182; fencing round site, £112; re-erecting old fence, £72; total, £15,000.

READERS interested in the examinations of the Surveyors' Institution would do well to obtain the pamphlet issued by the Institution on the Rules of Examination; this contains a great deal of information likely to be of use to intending candidates. The temporary address of the Surveyors' Institution is Savoy Street, Victoria Embankment, W.C.

REFERENCE was made in this column a fortnight ago to the present position of the work in connection with the Panama Canal. A few particulars concerning the rival scheme—the Nicaragua Canal—will probably be of interest. The proposed route is from Greytown on the Atlantic to Brito on the Pacific, a total distance of about 170 miles. Twenty-seven miles will be excavated canal. Lake Nicaragua will be connected with the Pacific by two sections of canal and by the Tola basin. With the Atlantic it will be united by slack-water navigation through the valley of the river San Juan and a series of basins in the valleys of the San Francisco and Desealo, connected by short sections of canal. The sea-level on each side is reached by three locks, which have been located as near as possible to the extremities of the Canal, thereby giving a clear summit level of 154 miles in extent out of the total length. The advocates of this scheme maintain that it presents fewer difficulties than the alternative route via Panama. The Nicaragua Canal has an admirable natural reservoir in the lake. It passes through a region capable of great development, and offering none of the unhealthy features of the Panama route. There is, moreover, no Chagres river problem to solve. On the other hand, it is not without difficulties of its own, but these are said to be easily surmountable, and it is thought that the time allowed for completion, six years, is amply sufficient.

THE opposition on the part of Welsh farmers and land owners to the London County Council's Welsh water scheme seems to be not quite so spontaneous as at first appeared, but to have been diligently worked up by the London water companies. A number of witnesses from Wales who have come to London to give evidence at the hearing of the allegations of non-compliance with the Standing Orders in respect of the London County Council's Bill are having all their expenses (and something beyond) paid by the water companies. One of these witnesses, in reply to a Daily Chronicle interviewer, said that he and his friends "would not have made any objection to coming to London to give evidence for the County Council if they had been paid for it. All they wanted was proper notice, and when they had got that they would readily sell out to the County Council at a reasonable price. There was plenty of

water in Wales, and if London wanted it, she could have it for all they cared, so long as they got proper compensation." Another of the Welsh witnesses, in reply to a question, said that he would be perfectly willing to sell his land if he got his price. "London wants water," he said, "and may have it. We have plenty for ourselves and for London too." If these gentlemen may be regarded as expressing the general views of the Welsh farmers, it would seem that they are not anxious to prevent the carrying out of the proposed scheme, but merely to secure reasonable compensation for themselves.

SIR WILLIAM CROOKES and Professor Dewar have been giving their views on bacteria and filtration to the members of Lord Llandaff's commission on the water supply of London. According to Sir William Crookes, the chemical character of the Thames water has improved very much of late years. At times when the water was low in the river, microbes in the filtered water increased. In the raw water there were more microbes in the water when in flood than when not in flood, but whatever the number of microbes might be in the unfiltered water, it was got rid of by filtration. Proper filters turned the water out practically pure. It was much better to have water in an exposed reservoir than in an enclosed aqueduct. He found that water taken from standpipes contained more bacteria than the water in the reservoirs of the Companies, and this generation of microbes took place to a much larger extent where water had to be taken for hundreds of miles through aqueducts. There were more bacteria in the water of Manchester and Birmingham after it had passed through the aqueducts than when it left the lakes. In Sir William's opinion the whole question of microbes was sentimental rather than practical, and for his own part he would have no objection to drinking Thames water unfiltered. The microbes that were to be found in Thames water were perfectly harmless. Professor Dewar went a step further and asserted that microbes were not only harmless but, in some cases, useful. We had a great many in our bodies, all doing beneficent work. He did not approve of private filtration. In fact, he said, private filters were utterly useless, and were often the means of introducing deleterious material into the water, especially charcoal filters. Of course, the microbes were destroyed by boiling the water.

THE Committee of the Birmingham Drainage Board, charged with the duty of considering the question of the disposal of the sewage, has presented its report. The main feature of it has reference to the report of Mr. Hawksley and Professor Dewar, together with their recommendations on the question of the Board's sewage works. Briefly, the recommendations were that the farming interests should be a secondary consideration, and nothing should be allowed to stand in the way of making the best use of the land from a sewage-disposal point of view, such crops only being cultivated as were found to be compatible with that object; that the sewage should be distributed at regular and short intervals over the whole farm, the area under irrigation being changed daily; that such portions of the existing farm as were in such a boggy state from the excessive application of sewage should be deep-ploughed and have a liberal dressing of lime; that the tank connections should be rearranged so as to allow of the systematic use of both sets to the best advantage; that a more liberal allowance of lime should be added to the sewage before it enters the tanks; that the supervision of the farm should be entrusted to the engineer so far as regarded the distribution of the sewerage, &c., the farm manager having charge of the farming operations; and that simple experimental artificial filters should be constructed, in order that the Board might be in a position to form an opinion as to the expediency of adopting, if circumstances required it, artificial filtration as a supplementary or relief process, or as an aid to land treatment.—The report was adopted.

Builders' Notes.

Trade and Craft.

THE process of glazing bricks with the use of lead has been declared by a Home Office order, dated December 17th, 1898, to be a process dangerous or injurious to health within the meaning of Section 8 of the Factory and Workshop Act, 1891.

FROM April 1st, 1899, the painters of Edinburgh and Leith will receive an advance in wages from 8d. to 8½d. per hour, with an increase from 10d. to 10½d. for overtime. In Glasgow, Greenock and Paisley, the current rate since the beginning of the year has been 9d. per hour.

IN the National Telephone Company's extensive new premises at Belfast, after special consideration, the system of "Combined Warming and Ventilation," of John King, Limited, Liverpool, has been decided on, the Rajah ventilating radiators and Rex electric air propellers being employed for removing foul air, and supplying fresh air, warmed in winter, cooled in summer.

THE new Temporary Fever Hospital, Knutsford, is being warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

THE report issued by the Labour Department of the Board of Trade on the state of trade in December, 1898, shows that the building trades generally were in a flourishing condition, though painters and decorators and plumbers were not so busy as a little while ago. The percentage of unemployed members of trade unions which make reports to the Department was 1·8 as compared with 2·8 in December, 1897. This is a much lower percentage than that in many other trades, and it may be taken as a fairly reliable indication of a brisk state of trade. Taking the year 1898 as a whole, the building trades may be said to have been in a satisfactory condition. The number of men affected by changes of wages during the year was 72,000, or about nine per cent. of the whole number employed. The changes were equivalent to an increase of 1s. 11½d. per week in the wages of all the workmen affected.

THE report presented at the annual meeting of the Bristol Master Builders' Association on the 18th, states that the work performed by the association during the past year alone has

been sufficient to justify its existence. It was only too certain that whilst the builders of this country had been content to remain unorganised for the purpose of protecting themselves and their trade interests, others, whose interests were unfortunately somewhat opposed to them, had been attacking, with ever-increasing vigour, many branches of the trade which legitimately belonged to the builders of this country; but it was gratifying to know that the trade generally was at last arousing itself to the importance of establishing local associations, and being affiliated to federations in the various districts. During the past year there had been increased prosperity in the building trade of Bristol, though there had been greater competition. Reference is made to the demand made by the men in March for an advance of wages and sundry alterations in the working rules and to the arbitration proceedings which followed. The effects of the Workmen's Compensation Act upon the trades are also passed in review, and it is maintained that the members of the association, after investigation and consultation, were enabled to secure very favourable rates and policies to cover not only the Workmen's Compensation Act, but also Employers' Liability and Common Law. In opposing the Plumbers' Registration Bill the committee was of opinion it had acted in the interests of the public and the building trade generally, and it intended to persevere in its efforts in that direction. Numerous trivial disputes as to the interpretation of rules and other points were continually receiving consideration at the hands of the Conciliation Board, but it was satisfactory to know that invariably the true spirit of conciliation prevailed, and that the points at issue were disposed of in a most amicable manner.

THE Tiverton Town Council have decided to apply for permission to borrow £6750, for Westex sewer (£4050) and sewage disposal works (£2700). The essence of the scheme was to carry on the present system of irrigation assisted by lifters.

THE English Delaval Steam Turbino Company Limited, which was registered a few weeks ago with a nominal capital of £100,000, intend to start business in Leeds. A site has been secured in Armley Road, New Wortley, upon which it is intended at once to erect large works for the manufacture of the Company's speciality. It is anticipated that employment will be found for several hundreds of hands, and as the business develops other engineers will be engaged.

GRAHAM, MORTON AND CO. LTD.

We have received from Messrs. Graham, Morton and Co. Ltd., Black Bull Street, Leeds, their illustrated catalogue of Labour Saving Appliances. The appliances illustrated cover a very wide range, and exhibit astonishing ingenuity in the application of mechanical principles to the lessening of manual labour in many directions. Loading and unloading ships; carrying coal, sand, gravel, &c.; elevating ashes from cellar to cart or van; conveying broken stone, &c. to the opposite side of a river; carrying small packages and boxes at fancy box, tin plate or bottling works; raising casks, pottery, pipes, blocks of ice, flour, grain, &c.; these are but a few of the purposes to which Messrs. Graham, Morton and Co.'s machinery is applicable. There are many alternative appliances so as to suit all manner of circumstances, and in many cases the work is done almost automatically and with extraordinary rapidity. The firm also manufacture in great variety appliances for breaking ores, stones, coal, &c., screening plant, disintegrators, weighing machines, wire ropes, gas and steam engines, lubricators, boilers, &c.

W. DUNCAN TUCKER.

Little attention is now generally devoted by architects to the subject of gardening and the relation of the garden to the house, and a lamentable want of knowledge is shown in building for horticultural purposes. We suppose that in these days of town buildings, or, as we heard it expressed recently, days of which the chief features are the building of public-houses and underground conveniences, it is thought unnecessary to consider the garden of a dwelling. Mr. W. Duncan Tucker is a fellow of the Royal Horticultural Society, and is a specialist in this matter. In his most recent catalogues various horticultural buildings in the most improved system of construction are enumerated, strength and lightness appearing to be the principles aimed at, the old-fashioned heavy timbers being entirely dispensed with and superseded by principal rafters and intermediate roof-bars; the former are strengthened at mullions by ornamental cast-iron spandrels to eaves and ridge. The principal rafters in the longer lengths are trussed with round iron rods, and roof bars are supported by the rods, with king and queen post to roofs. By this system the greatest amount of light is procured. Mr. Tucker uses the improved new system of glazing on bottom putty only. His address is Lawrence Road, Tottenham, N.

March 16th	July 20th	November 2nd
April 6th	August 3rd	November 16th
April 20th	August 17th	December 7th
May 4th	September 7th	December 21st
May 18th		

Offices, 6, Poultry, London, E.C. Telephone No. 999
Bank.

SURREY.—Choice BUILDING ESTATE.

—In a charming district, two miles from Horley
station (L.B. and S.C. Ry.) under one hour from
London and adjoining a village where are church, shops,
and post-office; two miles from Roman Catholic Church.

FOR SALE, a compact and valuable **FREEHOLD**
PROPERTY of 53 acres, with a frontage to the main
Brighton road of 2000ft., and perfectly ripe for develop-
ment, with residences of a good class. Prettily timbered.
Gas and water mains along the frontage. Would be
divided.

Plans and full particulars of the owner's agents,
Messrs. GREEN and SIMES, Auctioneers and Estate
Agents, Blenheim Mansions, Queen Anne's-gate,
London, S.W.; or Mr. W. M. LEACH, Auctioneer and
Estate Agent, Crawley, Sussex.

FAIRMILE PARK, near Cobham, Surrey.—A **FREE-
HOLD BUILDING ESTATE** of about 40 acres, with
possession.

MESSRS. DRIVER and CO. have received
instructions to offer to **AUCTION** at the **MART**,
Tokenhouse-yard, Lothbury, **NEXT SPRING** (unless
previously sold by private contract), the above property,
situate in a favourite residential district, about a
quarter of an hour's walk from the Oxshott and Fair-
mile Station, and about a mile and a half from Cobham
Station. The estate comprises Building Land, ripe for
development, the higher portion (sloping to the south)
possessing charming views over the intervening country
to Epsom Downs; and a Residence known as "South
Lodge," with stabling and garden; Eight small Villas,
some Cottages, and the "Griffin" Beerhouse. On a
portion of the estate brickearth is being worked, and
will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of
CHARLES JUPP, Esq., Solicitor, 43, Lime-street, E.C.;
and of Messrs. DRIVER and Co., 23, Pall Mall, S.W.

By order of Trustees.—Preliminary Advertisement.—
Freehold Building Estate, Streatham, near West
Norwood Railway Station.

MESSRS. FIELD and SONS, and Messrs.
WALFORD and WILSHIN, who are jointly
concerned, will **SELL by AUCTION**, at the **MART**, at
an early date, a valuable **FREEHOLD BUILDING**
ESTATE, known as High View Park, comprising 16a.
1r. 10p., lying immediately at the rear of and with
approach from Leigham Court-road; also a contiguous
Freehold Building Site of 2a. and 5p. in a new road
intended to connect Canterbury-grove with Thurlby-
road.

Particulars and plan, in due course, of Messrs. **KINGS-
FORD, DORMAN**, and Co., Solicitors, 23, Essex-street,
Strand; of Messrs. **WALFORD and WILSHIN**, Auc-
tioneers, Anerley, S.E.; and of Messrs. **FIELD and SONS**,
as above.

LEA VALLEY, PONDER'S END, and **BROX-
BOURNE**.—Freehold Wharf and Building Land, the
latter with possession, some of which has been
included in the schedule of the land required by the
East London Waterworks Company.

MESSRS. NORTON, TRIST, and **GILBERT**
will **SELL by AUCTION**, at the **MART**,
Tokenhouse-yard, London, E.C., on **TUESDAY, FEB-
RUARY 28th**, 1899.

LOT 1.—8 acres 0 rods 11 perches of Land, with a
frontage of 500ft. to the Lea and Stort Navigation
Canal, also bounded on the north and east sides by the
stream. This land is situate immediately opposite the
Corticine Floor Covering Works, Ponders End, and is a
fine site for the erection of a factory requiring waterside
accommodation. It is in the occupation of Mr. Ives.
This land has been scheduled to be acquired for the
New Reservoir for which the East London Waterworks
Company are applying for Parliamentary powers.

LOT 2.—144 Acres of Freehold Building Land, with a
frontage of 1080ft. to the road, close to Dobbs Weir,
and within one and a half miles of Broxbourne Town
and Station, now ripe for building purposes, possession
of which can be given on completion of the purchase.

Particulars and conditions of Sale may be obtained
from the Senior Official Receiver in Bankruptcy; of
Messrs. **CLARKE, RAWLINS**, and Co., 66, Gresham House,
London, E.C.; at the **MART**; and of the **AUCTIONEERS**,
70, Queen-street, Cheapside, London, E.C.

To Land Syndicates, Building Societies, Capitalists, and
others.

PINNER.—Important Freehold Building Estate of over
47 acres, with residence, known as Barrow Point,
occupying a beautiful position close to the quaint old
village of Pinner, within five minutes from the railway
station on the Metropolitan line, and extending to
within about 1/2 of a mile of Pinner Station on the
London and North-Western Railway, having easy
access from the West-end and City. The whole ripe
for immediate building operations, and admirably
adapted for villa residences of a superior class.

MESSRS. FAREBROTHER, ELLIS,
EGERTON, BREACH, GALSWORTHY, and
CO. beg to announce that the above valuable
PROPERTY, which they recently offered for Sale by
Auction, may now be treated for privately.
No. 29, Fleet Street, Temple Bar, and 18, Old Broad
Street, E.C.

The Society of Architects.

FOUNDED 1884: INCORPORATED 1893.

THE SOCIETY OF ARCHITECTS, St.
James' Hall, Piccadilly, W., WILL HOLD AN
EXAMINATION in Architecture and Construction on
APRIL 12th, 13th, and 14th, 1899, in the following
subjects:—

Section I.—ARCHITECTURE. Subject (a). Planning and Design. Subject (b).
Architectural History.

Section II.—BUILDING CONSTRUCTION AND
MATERIALS.

Subject (a). Construction. Subject (b). Materials.

Section III.—PRACTICE.

Subject (a). Specifications. Subject (b). Measure-
ment and Valuation. Subject (c). Contracts.

Section IV.—SANITARY SCIENCE.

The latest date for entering for the Examination is
March 23rd, 1899. Syllabus free. Copies of the last
Examination Papers one shilling.

To that Candidate who shall pass the Highest Exami-
nation, the **GOLD MEDAL** of the Society will be
presented, a **SILVER MEDAL** to the second in merit,
and **BRONZE MEDAL** for special excellence.

ELLIS MARSLAND, Hon. Sec.
C. McARTHUR BUTLER, Secretary.

R. I.B.A. EXAMS.

MR. W. CHURCH HOWGATE hereby an-
nounces that he has taken **MR. ALEXANDER G.
BOND**, B.A. Oxon., A.R.I.B.A., into PARTNERSHIP,
and that in future all applications should be made to
MESSRS. HOWGATE and BOND.

R. I.B.A. EXAMS. PREPARATION,
personally or by correspondence, in three, six,
nine, or twelve months' courses. Architectural
Lending Library. Special three months' finishing
courses.—For full particulars apply to Messrs.
HOWGATE and BOND, Associates R.I.B.A., Perchard
House, 70, Gower-street, W.C. (close to the British
Museum)

R. I.B.A., SOCIETY of ARCHITECTS, and
**CIVIL SERVICE TECHNICAL EXAMINA-
TIONS**. Preparation by correspondence, in residence,
or personally.—**MIDDLETON and CARDEN**, 19, Craven-
street, Strand, W.C.

PREPARATION for R.I.B.A. by correspon-
dence.—Papers personally corrected; special
terms for June and November Exams.—"Architect," 7,
London-road, St. Albans.

PERSPECTIVES.

E. BECKITT LAMB,
31, Craven-street, Charing Cross, W.C. 1

APPOINTMENTS VACANT.

The charge for Advertisements under this heading
is 1s. 6d. per insertion not exceeding four lines, and
6d. per line afterwards, prepaid. Three insertions
may be had for the price of two.

WANTED, an experienced ASSISTANT.—
Apply by letter, stating terms and qualifications,
Messrs. **GRAYSON and OULD**, Architects, 31, James'
street, Liverpool. 1

APPOINTMENTS WANTED.

An Architectural Causerie.

The Soane Medallion Award. THE award of the Soane Medallion at the R.I.B.A. has given rise to much justifiable complaint. The subject set was a large concert hall, and one of the conditions was that the designs must conform to the regulations of the L.C.C. applying to buildings of this class. The Council has awarded the prize to a design which ignores this condition.

tions to the promoters of competitions, and has a standing committee to deal with the subject. What should be the attitude of that committee towards this case? And with what influence or authority can the Institute intervene, in the interests of its members, in an outside competition, while its own competitions are conducted on the same lines? It is not necessary to enlarge on the injustice to the other competitors involved in such an award. The L.C.C. regulations are a great restriction on the designer, and possibly many of the other competitors could have produced designs even more admirable in the eyes of the Council, if they had felt themselves at liberty to ignore these regulations. And this prompts the obvious question—Why did the Council include this condition, that the L.C.C. regulations should be adhered to? The L.C.C. is no authority on Architecture, its regulations are not founded on the immutable principles of Art. They are merely strictly local and temporary rules, forming a rough-and-ready way of guarding against the worst results of the possible blunders of the ignorant. There is nothing final about them; there is no need to treat them with such an exaggerated respect, or to exalt them into a fetish.

site has been improved, but the building has been crippled by the L.C.C. regulations. Would it be too much to hope that next year the Council will wipe away temporary and local restrictions of all kinds, and give the students a chance to show—just for once—what a concert hall should be like. It is probably no small part of the secret of the success of Continental architects with their public monuments that, from their earliest days, they are taught what such buildings should be like, and how they should be treated. When they come to deal with practical affairs they know how the building should be done, and are able to bring it as near perfection as the particular circumstances will allow, and even in the worst cases to give at least a suggestion of a fine building. With our method of education the mind gets accustomed to meanness and distortion, and the imagination is dwarfed, so that when we do get a chance to do something fine we are unable to rise to the occasion. And, apart from this, the fact remains that to confront the enthusiastic student with the regulations of the L.C.C. is cruel; it destroys his youthful illusions and makes him old before his time. A.R.J.

R.I.B.A. PRIZE AWARDS: INSTITUTE MEDAL AND £5 5s. SOUTHWOLD CHURCH: SOUTH ELEVATION. DRAWN BY E. F. KNIGHT.

Apart from the requirements of the L.C.C., this design has some grave faults, both of construction and arrangement, but it is beside the point to take exception to these, as the Council is the judge, and it has set the seal of its approval upon them. But such faults tend to show that the Council was hardly led away by a momentary enthusiasm for a design of superlative architectural merit into forgetting the condition it had itself laid down. It is possible that on its merits—and it has merits, disregarding the L.C.C. regulations—this design may, in the opinion of the Council, be the best, but this is not the point. The point is, that all the designs should have complied with these regulations, and that none of those which did not do so should have been admitted to the competition. We are continually hearing complaints of the way in which municipalities and local authorities conduct competitions, and but lately two or three glaring instances have arisen in which the conditions have been ignored. The Institute has framed sugges-

While many of these regulations are sensible enough, more of them are quite the reverse, and place unnecessary and unreasonable difficulties in the architect's path. In fact, the more practical experience we have of them, the more we are inclined to the opinion that it is rapidly becoming impossible to produce Architecture (distinct from building) in any district where these rules are in force. From this point of view, then, it does seem unnecessary for the Council to needlessly complicate the programme by the introduction of restrictions, few of which are necessary to a good building, most of which are fatal. To design a building such as a large concert hall is sufficient of itself to tax the ability of the student, even when free from restrictions of all kinds. To do so under the L.C.C. regulations, and still to produce Architecture, is a problem for a master. It will be remembered that this same subject was set last year, only in that case the site was deformed, against which site a protest was entered in these columns. This year the

On Reflection.

A School Board Competition. PROTEST against the conduct of competitions has become almost a staple item in our weekly commentary upon Architectural affairs. A correspondent, referring to the remarks on the Dartford Board School competition which appeared in this column in our issue of the 18th inst., sends us the conditions of a competition, organised by the Middlesbrough School Board, for proposed new schools in Parliament Road. Although the competition assumes to be public, we believe that no advertisement of it has appeared in the professional journals, nor anywhere but in the local daily press. The Board undertakes to appoint an architect of "recognised position" to assist it "in judging the merits of the plans"; but although it is clearly implied that the members of the Board will act at their

own descretion, and not by the advice of the professional Assessor, they frankly admit that they offer *no premium*, and the inducement to compete is simply their promise to employ the successful competitor to execute the work at a commission of 4 per cent. The value of the proposed building, which will be about £13,500, would not justify such a reduction in any case, and this unreasonable demand is made the more intolerable by the preliminary gratuitous labour, and risky investment of time and money which are demanded of the architect before the commission is placed with him. Moreover, although in about 15 per cent. of public competitions special and extraordinary services are included in the 5 per cent. commission, it is quite exceptional for the amount of this commission to be reduced. We suggest, with confidence, that the Board named 4 per cent. because it was 1 per cent. less than architects are entitled to ask and usually receive for their

like an accessory instead of an essential part of the building. Besides this the Abbey, so far as its exterior is concerned, is vastly more estimable as a relic of antiquity and for its intimate associations with the history of our race, than for any primal beauty in its design. To build a spire now, to commemorate only the progressivist policy of the London County Council, would be an intolerable desecration which nothing could excuse. But if there should be any real fear of popular insensibility reaching to such an extreme as would sanction the building of a spire at Westminster, the impracticability of the act would settle the question. Six hundred years have not passed without leaving their mark upon the Purbeck piers, and though the Clerk of Works of the Abbey proudly told us some years ago, that if the building was neglected and allowed to fall to natural decay it would yet stand for a thousand years, some of the arches near the

perpetrated a delicious irony on the subject of his erudition and his accomplishments in Architecture which he was concerned to demonstrate and establish. An article had appeared in a professional journal criticising some late work of his at St. Albans with special regard to some panels he had introduced. The noble lord replied, with that inimitable bad taste which we have learned to expect from him, by abuse and recriminations of architects in general, and a pompous justification of his panels in detail. Unfortunately, however, he spelled the word "panel" with two n's throughout.

Plumbers' Registration. WE have reason to believe that the Worshipful Company of Plumbers are about to approach the President of the Local Government Board with a view to inducing him to move the Government to take some step towards enforcing the registration of plumbers.

R.I.B.A. PRIZE AWARDS: INSTITUTE MEDAL AND £5 5s. SOUTHWOLD CHURCH: PLAN. DRAWN BY E. F. KNIGHT.

work. We can only say we commend the sturdy business instinct developed by the Middlesbrough School Board, but regret that it has not been applied to a more profitable end than to depreciate and impoverish the art of Architecture. The just and proper course, both for the credit of the Profession and the welfare of the practitioner, is for architects to abstain in such cases as these. This was lately done by the architects of Plymouth on the occasion of just such another imposition by the Plymouth Corporation.

Why Not! "WHY NOT?" exclaims the Daily Mail in large ornamental head lines. "Why not finish the Abbey now?" and the enterprising paper accompanies the enquiry with an accurately finished drawing showing the Victoria Tower of the Houses of Parliament upon the left hand, and upon the right our well-loved Abbey tittivated up and tricked out with a central tower and spire, which confess, with brazen candour, to a near kinship with that of Salisbury Cathedral. Personally and upon the question of the design alone, we do not at all like our Abbey in the guise imposed upon it by the Daily Mail. The central spire of a Gothic church must predominate the whole or it becomes weak and foolish, and the spire here drawn merely looks

crossing have shown signs of spreading, and have been braced with iron ties, and it is evident the church could not support the weight of a completed tower and a spire of adequate dimensions without partial reconstruction.

In the Pillory. LORD GRIMTHORPE has alienated himself so effectually from all lovers and students of architecture by the ignorance and pomposity with which he set about his gratuitous "Restorations" at St. Albans, that we confess it to be with a somewhat unfriendly glee that we find him pilloried in the pages of Punch in his rôle of writer of letters to the newspapers. The Times, which is always willing to lend itself to the expression of ponderous commonplaces above the signature of hereditary greatness, has been of late beset with Lord Grimthorpe's performances on the big drum. This noble letter-writer's inanity, his confusion of ideas, his illiterate methods, his rambling relative clauses and parentheses, and his school-boy disregard for punctuation are most happily and wittily travestied by Punch in a letter on "The Weather." Lord Grimthorpe, however, has a happy knack of discrediting himself, and we remember an instance, on the occasion of one of his last effusions on the subject of his work at St. Albans, when he

The scheme of registration and certificates which was inaugurated by the Plumbers' Company ten or more years ago, has for a long time been favourably regarded by the Local Government Board, no doubt on its merits as a contributory safeguard to the public health. It is, of course, unreasonable to regard the company as having any special care for the public health, or any other serious motive than to raise the status of the trade. Nor does the fact that plumbers have widely availed themselves of the theoretic and practical test examinations which the Company has instituted in London and other centres show that the scheme is popular or beneficial to the plumbers as a whole. The struggle for existence assures that any opportunity, just or unjust, which enables one man to become privileged above his fellow will be sought after. It is, of course, true that a very small flaw in plumbers' work may occasion a great evil, and that much harm is occasioned by incompetent workmen; but it is also true that the careless or lazy workman is a commoner and a far more dangerous enemy to sound sanitation, and legislation is a measure which is only justified by the extremest need. We should like to hear from any of our readers who have special opportunities of knowing what is the feeling among the plumbers themselves.

R.I.B.A. PRIZE AWARDS: THE SOANE MEDALLION. DESIGN FOR A CONCERT HALL. BY W. A. MELLON.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

R. I. B. A.

THE PRIZE DESIGNS AND DRAWINGS.

IN our last issue we dealt with Mr. Mellon's design for which he was awarded the Soane Medallion, and of the work of the other ten competitors there is little to be said. The subject demanding at once qualities of utility and a monumental expression in the design, and involving complicated questions of acoustics upon which little is definitely known, and beset in all directions by the minute and often tiresome and unnecessary restrictions of the London County Council, seems, in spite of the number of competitors who submitted designs, to have been a difficult one to handle, and altogether beyond the scope of the young architects under the age of thirty

the way he has expressed the dome within the building, and the exterior design, although deformed by certain affectations, and despite the fact that the five leaded ogee domes are not well knit and combined with the bulk of the edifice, yet harmonises well with the idea of a palace of music, if it does not actually suggest it. "Itinerant Architect's" design, on the other hand, which is also of the "Romantic" order, and is more simply and less ostentatiously composed than the last described, does not associate itself readily with the idea of a concert hall.

The designs and drawings submitted in the other competitions are unusually numerous and in some instances of extraordinary merit; but it is rather in drawing than in design that special excellence is to be noticed. Anyone who viewed the late exhibition must have remarked how much more attention, both in the list of prizes and the contributions of competitors, was bestowed upon the subject of

Royal mausoleum were submitted, the award—a certificate and £30—being made to Mr. James B. Fulton, a special medal and five guineas being allotted to Mr. Alexander M. Gardiner, and a certificate of honourable mention to Mr. Ernest Jago. Mr. Fulton's design has not quite such an imposing air as one would expect to find in a Royal mausoleum; it is, in point of fact, considerably the smallest of the whole group. This lack of grandeur is particularly noticeable as Mr. Fulton's beautifully drawn perspective shows only the building itself, and not the approach and flight of steps upon which it stands. The design has considerable merit. It expresses, as far as its exterior is concerned, exactly what its author meant. It says one thing in a finished and complete way. Within it is less successful. The building is too lofty in relation to the dimensions of the plan for the dome to be entirely satisfactory, and the whole has a stilted look. Mr. Fulton's internal perspective

R. I. B. A. PRIZE AWARDS. THE GRISSELL COMPETITION. HON. MENTION. DESIGN FOR FRUIT, FLOWER AND VEGETABLE MARKET: CONSTRUCTIONAL DETAILS. BY CHARLES A. DAUBNEY.

years, to whom the prize is confined. In most cases the opportunities for a plan that should lend itself to impressive internal treatment had been frittered away by the practical needs of the subject, and in point of external design the whole group was disappointing. As presenting some points of exception from these general remarks we may mention "Civitali," "Swan," and in particular "Lohengrin" and "Itinerant Architect." These last two have affected a style, or rather a method, of design now growing yearly in popularity, which may in the future possibly be known as "early twentieth century," but which for want of a better name may now be called "Romantic." It consists in giving expression to a building not in accordance with the rules and forms of the traditional styles, but merely in recognition of those subtle rules of proportion, texture, superimposition, colour, light, and shadow, which constitute the primal elements of beauty in all styles and dates of architecture. "Lohengrin's" plan, which indicates rather a theatre than a concert hall, seems to have been laid out very scientifically on some one of the many theories of acoustics, and in other particulars appears to have been suggested by the Wagnerian Theatre at Bayreuth. We like

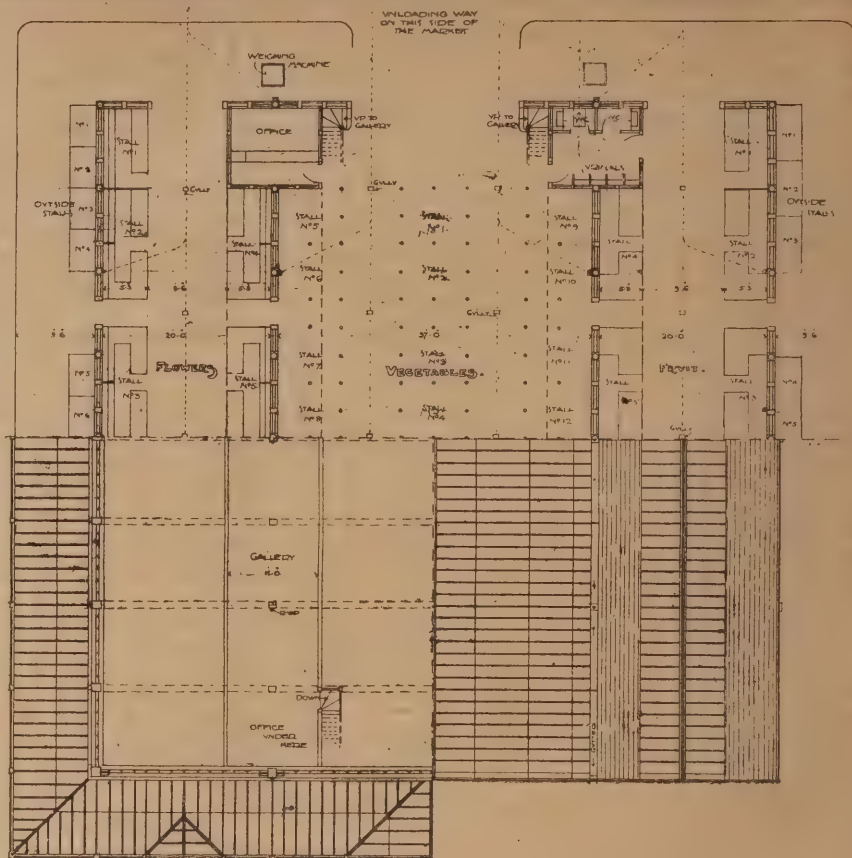

drawing than that of design. The drawing at these exhibitions becomes year by year more marvellous—there is no other word—and the Pugin Studentship this year has, in the opinion of the prizes committee, produced a larger competition and better work than has been shown in any previous year, in spite of the remarkable excellence of the work submitted for this prize during the past ten years. It cannot, however, be said that the quality of the designs of the rising generation of our architects bears any comparison in point of excellence with that of their drawings, and it is to be regretted that so much attention should be given to drawing by the aspirants to fame in an art which demands scientific knowledge, imagination, and original thought, but in no case an extraordinary skill in draughtsmanship. The group submitted by aspirants to the prize endowed by Sir William Tite, to promote the study in England of Italian architecture, is only one of many instances which may have been remarked of late years, in which the merits of the design are entirely subservient to the remarkable ability of the draughtsmanship. The Tite Prize this year has, however, produced a better competition than usual. Eight sets of designs for a

is, however, one of the most able and forcible line drawings, sketchy though it is, that we have ever seen, though in point of style this design can hardly be considered Italian—free Renaissance, or late Renaissance best describes it. All competitors for the prize have introduced one form or another of dome into their compositions, except "Endeavour," who has reverted to a classic order of design, consisting in a pseudo-peryteral rectangular building, with a pediment at either end, surmounted by a pyramidal scheme of receding courses suggested by the famous Mausoleum at Halicarnassus, which is supported on the colonnade within the building. The Grissell Prize, for the encouragement of the study of construction, produced four designs for the fruit, flower, and vegetable market which was the subject set. Mr. G. Gardner Wallace won this prize—a gold medal and ten guineas—with a market consisting of two rectangular wings with a central dome over the intersection of the two axes of the building. All competitors used glass and iron roofing supported on iron columns, which was one of the conditions of competition. Both the winner of the award and "Artichoke" succeeded in producing designs of architectural

merit with a difficult and rather uninteresting subject.

Of the prizes for Studies and Drawings, the Owen Jones Studentship, as usual, was not distinguished by a numerous entry; in spite of the value of the prize, which is £100, only three sets of drawings were submitted. Those handed in by Mr. John Stewart are studies made strictly in accordance with the object of the founder of the prize, who established it to promote the study of colour decoration. Too often the drawings do not fulfil the intention of the donor; and students are apt to forget that a study of a sunset, for instance, is not a study in the decorative value of colour. Mr. E. T. A. Wigram has somewhat fallen into this error, and many of his beautiful drawings and water-colour sketches belong too nearly to the domain of the mere water-colour artist to recommend them to the prizes committee. Mr. John Stewart has made excellent studies of painted mosaic, majolica, marble, and stained-glass decorations, chiefly from the towns of Northern Italy. The only fault we find are that his colour lacks brilliancy and is muddy, and that he has been too accurate in exactly reproducing the accidental blemishes, and the stains of time, which occur upon the originals of his various subjects.

The ever-popular Pugin Prize we have already alluded to. Mr. J. Hervey Rutherford has won this prize with a large number of accurate, vigorous coloured drawings and sketches. He includes some admirable studies of coloured glass from King's College Chapel, Cambridge. Mr. E. H. Bennett has been awarded a special medal and five guineas for some wonderful studies of the west and north porches of Chartres Cathedral. He has more than one study of each subject, and has drawn a detail of one jamb of the west porch both in sepia and in line. These are such works as Mr. Ruskin would admire. They are most valuable records, besides being drawings of very remarkable merit. We hope that their author will be able to dispose of them to some public gallery

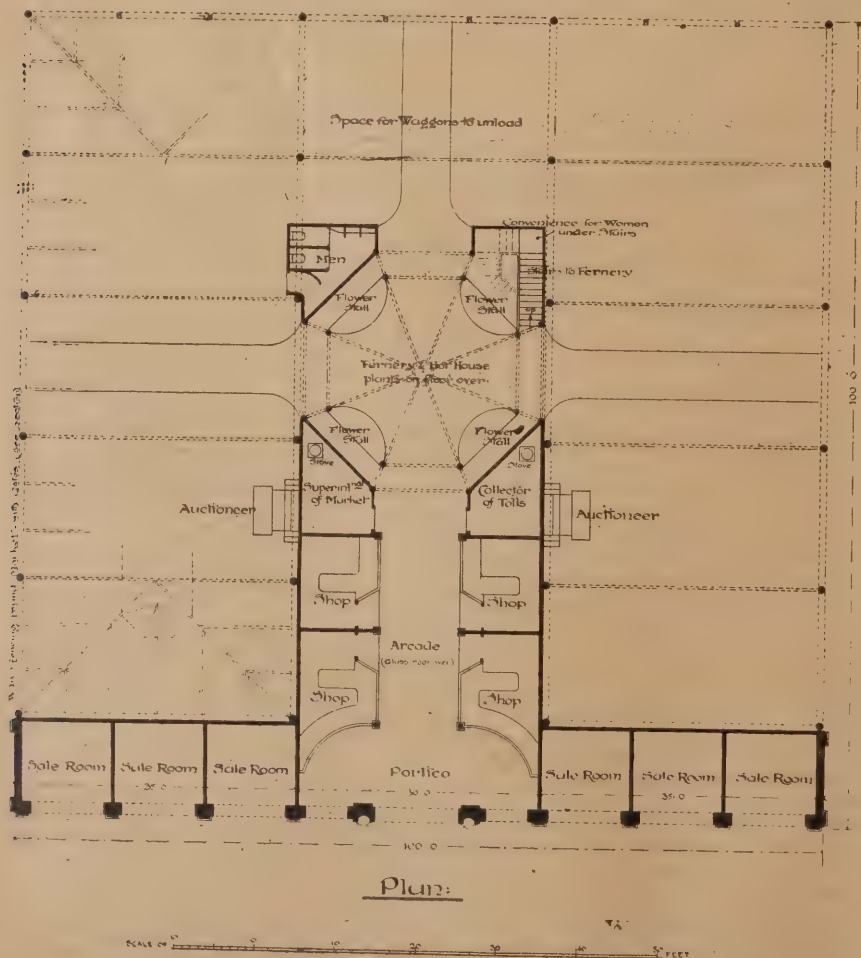

R.I.B.A. PRIZE AWARDS: THE GRISSELL COMPETITION, HON. MENTION. PLAN OF FRUIT, FLOWER, AND VEGETABLE MARKET. BY CHARLES A. DAUBNEY.

or museum, for they are a great deal too good to be relegated to the great limbo of students' drawings. The whole set of contributions to the Pugin competition is, as has been said, of

extraordinary merit, but we particularly notice the pencil studies of Mr. Albert Herbert, who has won with them a certificate of honourable mention. He gets a wonderful softness and variety of light and shadow and of texture into his pencil work. We think he would have won a higher recognition if he had submitted some good measured drawings, and not confined himself to sketching bits and corners of buildings.

The measured drawing prize has produced a remarkably fine example of architectural draughtsmanship, in the drawing of the north porch of St. Paul's. The subject is not a large one, but Mr. H. E. Kirby has made a lot of it. We never saw better architectural drawing in point of mechanical accuracy, and equality and precision of line. Mr. Heaton Comyn, who, with Mr. E. F. Knight, has won a special prize with his drawing of St. Catherine's, Cambridge, has rather spoiled his set by back-lining—a vicious accomplishment at the best. His drawing, however, is strong and bold, and it is perhaps a pity that his subject was not one of greater architectural interest. In contradistinction to him, Mr. Knight errs somewhat in the extreme minuteness of his methods. In his one-eighth inch scale drawing of Southwold Church he has shown as much as most draughtsmen would attempt in a quarter-inch scale drawing. This extreme minuteness is a mistake; small ornament cannot be properly or clearly shown to so small a scale, and for architectural purposes a few details to a larger scale are of greater value.

Among these prize drawings was exhibited the work done by the Pugin and Aldwinkle students, Mr. De Gruchy and Mr. Fulton, on their studentship tour. We notice the Pugin student is developing a freer style and a personal and characteristic touch in which we have hitherto found his drawing sadly lacking. Mr. Fulton has added to the reputation he won with his drawings submitted for the Pugin Prize last year. Whatever he draws is presented in his own quaint individual style. He includes among his studies some drawings of plants after the manner of those which will be remembered in last year's exhibition. They are of their kind as good as anything we have ever seen.

R.I.B.A. PRIZE AWARDS: THE GRISSELL GOLD MEDAL. PLAN OF FRUIT, FLOWER, AND VEGETABLE MARKET. BY G. GARDNER WALLACE.

Mr. H. H. Statham on the Planning of Concert Halls.

AT the meeting of the Royal Institute of British Architects on January 23rd, Mr. H. H. Statham made some remarks, as stated in our report of the meeting in last week's issue, on the planning of concert halls, with special reference to the Soane Medallion designs. In view of the extraordinary interest excited by the Institute's award in this competition, an extended report of Mr. Statham's speech will probably be read with interest.

With regard to the designing of concert rooms in general, Mr. Statham remarked that unless it was stated in the conditions that the hall was to be used also for other purposes, such as dancing, it was desirable to have the floor slightly rising from front to back. A large expanse of smooth wall was generally a danger in the case of echo. The object was for the sound to get to the ears of the hearers, but not to be brought back to them again; a large expanse of wall became a reflecting surface which required to be broken up. It was more difficult to extinguish echo

always required and were always placed in that position, so as to be just opposite the conductor and therefore directly under his control. The reason being that if the drums were the least bit out of time the effect would be disastrous. Wherever possible it was best to have the passage from the green-room to the orchestra on a level; at all events there should be no

STEPS IN UNEXPECTED PLACES.

To trip up while making his way to the platform was very disconcerting to a singer. Speaking of the arrangement of the organ Mr. Statham said that most of the competitors seemed to have no idea of the size of a modern concert-organ, of which an average specimen would require about 300 square feet of area, and the pipes and soundboards would weigh over twenty tons. An organ was not, therefore, a thing that could be hung up on the wall where they pleased. For a first-class concert-organ height was required for a 32ft. pipe, which meant 3ft. or 4ft. in addition to the 32ft. The system of carrying the organ on girders over the heads of the chorus got it out of the way, no doubt, but it was a very bad position for the effect of the instrument; it

ANCIENT & MODERN BUILDINGS IN PALESTINE.

(Continued from page 394.)

MR. A. C. DICKIE opened the discussion, which followed Mr. Pite's lecture, reported in our last issue, and proposed a vote of thanks to the lecturer. Mr. Dickie stated that the modern part of Jerusalem is interesting only in the way that it illustrated the great increase of Jewish population there. Outside the walls a new city had sprung up, and seemed to have arranged itself in a irregular and wriggling manner. Most of the modern building was uninteresting, and it was a pleasure to come upon Mr. Pite's hospital. When he was last at Jerusalem some of the finest buildings had been painted a sickly pink in honour of the German Emperor's visit, and the beautiful grille in the Mosque of Omar had been painted yellow. The report that the streets and walls had been cleaned was only partly true, for the filth had been removed from the main streets and deposited in the side alleys, and had doubtless been

in the case of curved walls than of smooth ones. With reference to the

POSITION OF THE ORCHESTRA,

Mr. Statham remarked that he had noticed on one, if not more, of the competition designs the chorus seats were put straight across. That was bad. The seats for chorus and band were always placed on a curve for practical reasons. It was desirable that the chorus, when standing, should turn as much as they could towards the conductor, so that they could the more easily follow his directions, while at the same time attending to their music. A still more important point was that the two sides of the chorus should be able to hear each other; if they were put partially facing each other they were able to do so, and that was a great assistance in

KEEPING TIME.

It did not do, however, to arrange the seats in a horseshoe form, because then the audience could not hear so well. In more than one of the designs the orchestra was placed to stand on a flat floor at the base of the chorus. That was a bad arrangement, because those behind would be shut out from view of the conductor. The orchestra should be placed on steps which should follow the same curve as the chorus. The chorus could do with 2ft. 6in. steps, the band required broader ones, say about 3ft. 2in., because room must be allowed for the players of bow instruments to move their arms backwards and forwards. Mr. Statham proceeded to explain, with the aid of a diagram, the best positions for the different instrumentalists. The centre portion of the top tier, for a width of about 6ft., should be projected outward to form a platform for the kettledrums, which were

should be brought down as low as possible. If the organ were built on the floor so as to project into the chorus seats, that was a good position for the instrument itself, but bad for the chorus, as a certain proportion of them were isolated in a bay on each side of the organ. He considered the best

POSITION FOR THE ORGAN

was at the back of the chorus, utilising the space not required at each side for the chorus stairs. Above the ceiling of the staircase the sides of the organ would stand free. The bellows for a large organ ought to be provided for in the vaults. In recent times the management of long movements (electric or pneumatic) between keyboard and organ had become so easy that there was no excuse for placing the organist near the organ. His position should be near the front of the orchestra and facing the conductor. The player could then hear the effect of the organ in combination with band and chorus, which he could not do when sitting close under it. There should be a definite line of demarcation between the chorus and band; this was seldom done (he had never seen it except at the Albert Hall), but it was a great deal better to divide them up than to let instrumentalists get mixed up with the chorus singers.

GRANITE columns, in memory of the late Prince Bismarck, are to be erected in 200 cities and towns of Germany. An urn or brazier will be placed on top, and from this fire will burn every first of April. Such, at any rate, is the scheme of commemoration which the University students hope to see carried out, and they are inviting designs for a column,

distributed again. The Jaffa Gate was thought scarcely the sort of entry for the Kaiser, on account of its crooked nature, so a breach was made for him to the left of it. He considered, with Mr. Pite, that St. Mark's was nowhere in comparison with the Mosque of Omar. The toughness of the natives to encounter infectious stench had been strikingly evidenced at the Pool of Siloam, when they begged the Palestine Exploration Fund to stop throwing down carbolic acid, which it had been thought would relieve the natives, as it had such a nasty smell. The method of constructing a dome was as follows: After the four walls had risen to a certain height the centering of the roof was modelled in brushwood; on this brushwood a layer of lime and earth was put, with another similar layer on top. The dome was made above this, and consisted of muddy lime and stones, the lime concrete being rapidly conveyed up gangways, and the whole of the dome was built in such a short time that the construction settled naturally, so that after weeks of rain the domes were not found to let the water through.

Mr. Alex. Payne, in seconding the vote of thanks, said that Mr. Pite had resisted a great temptation in not dealing more fully with ancient buildings, for the country was covered with them. Mr. Pite had done them a great service in giving them his experience, and it would be a benefit to any architect who might have to carry out work there. The speaker had given the whole of his time to the old building, and had not troubled about the hideous modern German buildings in Jerusalem. He said that Palestine was a very expensive country to travel in. One could only make twenty miles a day, and could only travel in the interior of the country on horseback. An immense retinue had to be engaged,

MOSAICS AND MOSAIC WORK.

BY mosaics, in the widest sense of the word, is to be understood the art of producing a design or painting by the joining together of small pieces of hard substances, either naturally or artificially coloured, and hard stones, marbles, and glass are the materials most frequently used in this description of work. Two subdivisions may be made, according to the nature of the process. One, mosaics, properly so called, the combination of many pieces by which a decorative surface is constructed; the other, inlays, in which various figures or spaces are cut out of a ground, and filled in with another substance, or with different tints of the same material. There are almost endless varieties of both kinds.

Descriptions.—A very learned Italian writer has divided Roman mosaics into four classes, namely, *tesselated* and *sectile*, applied to pavements generally; and *ficile* and *verminulated*, or pictorial, applied to walls and vaults. Of

ments, and pictures, the entire subject being portrayed in its true shades and colours, by a judicious arrangement of small cubes of different coloured marbles, and where extreme brilliancy was required by the aid of gems and pieces of *ficile* work. This kind of mosaic may be divided into three sub-divisions, not of difference of work, but of scale. The largest kind was generally employed for large pavements or ceilings, and represented figures of gods or curtains and the like. In this work, though the stones used are not always of a regular shape, they more nearly approach the square than in any of the smaller styles. The *medium* or middle was a much finer kind of work, and such subjects were generally executed in it as demanded greater delicacy in the treatment and softness in the shades and tints—cupids and children, flowers and festoons. This medium mosaic was employed chiefly for the decoration of walls, and it is this method which has virtually come down to our own times.

The modern process of making mosaics commonly employed at Rome is this: A plate,

CENTRAL PUBLIC LIBRARY
COMPETITION.

KINGSTON-UPON-HULL.

THE competition instituted by the Hull Public Libraries Committee has just been brought to a conclusion. Their assessor, Mr. Sydney R. J. Smith, who adjudicated on the designs, has awarded the first premium of £50 to Mr. James S. Gibson, 11, Gray's Inn Square, London; the second premium to Mr. Henry F. Williams, 149, Fleet Street, E.C.; the third to Mr. Edwin J. Sadgrove and Alfred A. Webbe, joint architects, 22, Surrey Street, Strand, W.C.

Fifty-one sets of drawings were submitted, out of which number only two or three were from local architects. Considerable skill and ingenuity was displayed in dealing with the subject on a somewhat inconvenient site. The site has frontages to two streets—Albion Street and Baker Street—and it was suggested in the conditions issued that no room should,

R.I.B.A. PRIZE AWARDS: SOANE MEDALLION. DESIGN FOR CONCERT HALL: SECTION. BY W. A. MELLON.

these the *tesselated* is probably the most ancient, and consisted of small cubes of marble, seldom averaging more than three quarters of an inch square, worked by hand into such simple geometrical figures as, when combined, would best compose a large figure equally geometrical, but, of course, more complex. The first contrasts employed were black and white. The *sectile*, or sliced work, was formed of the different slices of marble of which figures and ornaments were made, and the most notable example is to be found in the splendid pavement of the Pantheon at Rome, where the principal marbles are arranged in alternate round and square slabs. The *ficile* work was composed of small portions of mixed silice and alumina, coloured by the addition of one of the metallic oxides. The principal advantages offered by this material were that it could be obtained of any variety of colour, from the most delicate to the most intense; that it could be easily reduced to any given form; that it was far less costly than the precious marbles; and, lastly, that it could be covered with an untarnishable gilding. The following was the process for producing this gold ground *tesserae* existing at Pompeii. On a piece of vitreous compound—in shape and size a thin tile and unburnt—a sheet of glass was laid, and over that a piece of gold leaf covered by another sheet of very fine glass; the whole being then placed in a kiln was burnt to such a point as to render the union of the parts perfect, and to make the whole tile homogeneous in substance. It was then broken up into the required sizes. The *verminulated* work, the most elaborate of the four varieties was supplied to the direct imitation of figures, orna-

generally of metal of the required size, is first surrounded by a margin rising about three quarters of an inch from the surface. A mastic cement, composed of powdered lime, stone, and linseed oil, is then spread over as a coating a quarter of an inch in thickness. When set this is again covered with plaster of Paris to the level of the margin; upon this is traced a very careful outline of the picture to be copied and just so much as will admit of the insertion of the small pieces of *Smalto* glass is removed from time to time by a fine chisel. The workman then selects from the trays, in which are kept thousands of varieties of colour, a piece of the tint which he wants, and carefully brings it to the necessary shape. This piece is then moistened with a little cement, and embedded in its proper situation, the process being repeated till the picture is finished, when the whole being ground down to an even face and polished, becomes an imperishable work of art. The Florentine mosaic, which is chiefly employed for altars, tombs, and coffers, is composed of materials in veneers, the expense and the labour being both very great. None but the hardest stones are employed, every separate piece must be backed by thicker slices of slate or marble to obtain additional strength, and every minute portion must be found till it exactly corresponds with the pattern previously cut.

W. N. B.

PLANS for the erection of sixty-three houses and a higher grade Board School were passed at last week's meeting of the Ilford Urban District Council.

if possible, be a passage way to any other room; and this appears to have been the crux of the whole problem, whether to carry a corridor right through from one street to the other, and, if so, whether to put it on the side of the Church Institute or the opposite side.

In the first premiated design the corridor has been placed upon the opposite side, and carried through to Albion Street, forming a central entrance. The news and magazine rooms are placed on the Baker Street portion of the site, the lending library occupying a central position. Next the Church Institute, the ladies' room and dining room, entered therefrom by the staff, are placed on the Albion Street front. On the other side of the corridor, which is 13ft. 3in. wide, are the librarian's office on Albion Street front, the work room, and public stairs to reference room.

The reference room, 30ft. 6in. by 44ft. 9in., occupies the Albion Street front, with book store attached next Church Institute. No staff entrance is provided, and the two w.c.'s on either side of the principal entrance does not seem a happy arrangement. The design has, however, been carefully thought out; the plan is simple and compact; all the public rooms are well arranged, and under the control and supervision of the staff.

The exterior is treated in a somewhat severe manner, and may be called a free adaptation of Georgian. The centre portion is stone with pilasters at the angles and columns with deeply recessed arch in the centre. The wings are of brick, with stone window dressings. A turret occupies the angle next Hull Church Institute, which, however, does not appear to group very happily with the rest of the elevation. The

composition of Albion Street front does not appear to have been so well considered as other features of the design, and we fear, with tall buildings on either side of it, the new library will look rather in a hole.

The second premiated design places the corridor next Church Institute, and the whole of the accommodation on the opposite side, with Lending Library on Albion Street. The ladies' room placed on Baker Street front appears very ill-considered, in respect of supervision and service. This design has a very ordinary rusticated elevation.

The third premiated design has a peculiar Renaissance front, three arches on the ground floor, with columns and groups of three windows above each, and a large tower which appears somewhat inappropriate. The iron cresting on the roof is not a success. On the plan the hall and corridor occupy too

conditions of the competition, is not to exceed £7500, which includes warming, ventilating, lighting, sanitary work, and fire appliances.

All the drawings were on exhibition in the banqueting room of the Town Hall on Friday, the 20th, and Saturday, the 21st of January, when a considerable number of those interested inspected the designs.

LEEDS HOUSING SCHEME.

LEEDS Corporation has a large housing scheme on hand which is giving it a good deal of trouble. An insanitary area has been cleared and the people displaced have to be rehoused. One of the reasons why the area in question—the York Street area—was con-

the local enactments during a transitional period, in the confidence that the Corporation would carry out the general sanitary law as rapidly as possible. The Board do not regard the decision of the Committee as expressing or implying any approval of the principle of back-to-back houses." The letter from the Local Government concludes thus:—"Under these circumstances, and having regard to the fact that this proposal would be altogether in contravention of principles which, after mature consideration, have been adopted and maintained by the Board for many years, the Board are not prepared to accede to the proposals which were submitted on behalf of the Town Council." The Sanitary Committee of the Corporation have received this communication with a good deal of dissatisfaction. It is contended that the type of building condemned was very

PLAN OF STREET FLOOR

R.I.B.A. PRIZE AWARDS THE SOANE MEDALLION. DESIGN FOR CONCERT HALL: PLAN. BY W. A. MELLON.

much valuable space; indeed, the whole scheme requires a good deal of pulling together.

It has undoubtedly been a very keen competition, as six out of the fifty-one designs sent in show a very high standard of excellence both in plan and elevation. We understand that some were thrown out on account of expensive fronts, others on account of the size of the perspective drawings.

A very beautiful design shows a columnar treatment carrying an eaves cornice on the first floor, with gables at either end, and a turret next Church Institute. The plan is distinctly good, but fails in not giving the passage through to Baker Street; it, however, provides a fine lending library and good scheme for future extension. A fine perspective drawing, one of the best in the room, shows the design to advantage.

The materials proposed for carrying out the successful design are local pressed brick and white Ancaster stone, the main roof to be covered with green Westmoreland slates. The ground floor public rooms will have wood block floors, and entrance hall and vestibules laid in mosaic. The walls internally of corridors and hall will have dadoes of glazed bricks or tiles.

The cost of the building, according to the

demned as insanitary was that the houses were chiefly of the kind known as "back to back" houses. Yet, strange as it may seem, the Corporation has proposed to re-erect dwellings of the same class. But the Local Government Board has put its foot down on the proposal. It was contended by the Corporation that Parliament specially recognised the erection of back-to-back houses; but to this the Local Government Board replies:—"The Board do not consider that the practice of erecting back-to-back houses was approved by Parliament in 1893. It will be seen from the evidence of the proceedings before the Police and Sanitary Committee on the Leeds Improvement Bill of 1893 that the Committee were asked to sanction the clause—now Section 7 of the Act—as the effect of it would be to prevent or supersede the worst forms of back-to-back houses which the then local legislation of Leeds allowed or tolerated, and because in the event of that legislation being repealed without the substitution of the new clause it would be necessary to make temporary arrangements until building by-laws could be obtained under the general law; and the Board regard the Committee's decision—which will be found at page 218 of the evidence—as being directed to mitigate the evils existing and allowable under

different from that which it is proposed to erect. In the words of one member, a back-to-back house of the improved type is far superior to any tenement dwelling. However, the Committee has now no option but to amend its scheme.

THE rising generation ought to grow up with an appreciation of beauty in form and colour to which their parents in many instances are strangers. For the past two years an interesting experiment in the development of artistic taste and love of colour in elementary school children has been in progress in the boys' department of the Alma Board School, Bermondsey. Instead of the children being taught the old freehand system of drawing, beginning with lines, angles, and parallels, they are supplied—in accordance with the alternative syllabus of drawing issued by the Education Department—with watercolours and brushes, and trained to make original designs in colours. Many of the boys even in the lowest class—children seven and eight years old—produce with their brushes and watercolours, without any model to copy from, pretty designs, which show a real sense of form and colour.

KEYSTONES.

A NEW Wesleyan Chapel was opened last week at Horfield. The total cost of the building is about £3000.

THE Essex County Council has resolved to oppose the London County Council's Water Bills in the coming session.

HANDSOME new premises are being built in Glasgow for Messrs. Stewart and McDonald. The entire front is to be built fire-resisting.

THERE is great need for a new infirmary in County Tyrone, and strong efforts are being made to obtain the necessary funds. The cost of the proposed building will be about £10,000.

THE result of the first two weeks' working of the London County Council's tramway showed an increase in the takings of £176 as compared with those of the two corresponding weeks last year.

THE group of Vienna artists known as Secessionists have opened their third exhibition in that city. Only foreign works are on view; these include a number of watercolour drawings by Mr. Walter Crane.

MANCHESTER CORPORATION has been summoned by the Mersey and Irwell Joint Committee for polluting the Ship Canal and the river Mersey. The hearing was, at the county police court last Wednesday, adjourned for three months.

A SYNDICATE has acquired for 1,472,000 dollars the entire street railway system and street railway concessions in Havana, Cuba. The city will have, it is said, one of the finest street railway systems in the world. Work is expected to be commenced in the spring.

A MEMORIAL window to the late Captain Trotter, a popular Worcestershire huntsman, has been unveiled in the Church of Martin Hussingtree. The window, which is of bold design and rich colouring, depicts St. Michael and the Dragon, and is placed on the west side of the church.

MR. T. BUTLER WILSON informs us that he has taken into partnership Mr. Robert P. Oglesby, who has been associated with him for the past fifteen years. The style of the firm will in future be T. Butler Wilson and Oglesby, architects, 72, New Bond Street W., and at Harrogate.

THE Building Act Committee of the London County Council has rejected the plans submitted on behalf of the Industrial Dwellings Company for erecting a block of working-class dwellings in New Church Road, Camberwell. The reason for the refusal was not stated in the committee's resolution.

THE Natural History Museum at South Kensington is to be lighted by electricity. The electric light will be gradually introduced into the various parts of the large building—first of all into the offices and studies of the staff and the workshops in the basement, then into the various public galleries.

THE Parish Church of St. Nicholas, Strood, which recently sustained serious damage by fire, has met with another misfortune. During a gale, a portion of the tower has been blown down. A heavy piece of masonry crashed through the roof and fell on the floor of the church, narrowly missing the font.

IN connection with the Edinburgh Architectural Society, prizes of £3 3s. and £2 2s. are offered for competition amongst members. The subject for the first prize is a set of working drawings for a small hotel at a Scottish summer resort on the coast, and for the second a design for the treatment of a classic room after the style of Wren or Gibbs.

A SERIES of lectures on matters connected with building is being delivered on Monday evenings at the Carpenters' Hall, London Wall, E.C. On Monday evening Professor Banister Fletcher is to lecture on "Ornament;" and he will be followed on February 13th by Mr. Basil Mott on "Building an Underground Railway," on the 20th by Professor Roger Smith on "Terra-cotta," and on the 27th by Mr. William Poll, on "English Playhouses in the Sixteenth, Seventeenth, and Eighteenth Centuries." The lectures will be illustrated with photographs, specimens, and lantern slides. Admission is free.

SOME discussion took place at last Thursday's meeting of the Corporation of the City of London on the subject of the bridge which Messrs. Faudel-Phillips have thrown across Queen's Head Passage to connect their two warehouses. The legality of the proceeding was questioned, but it was decided that the bridge should be allowed to remain during the pleasure of the Corporation.

AN interesting find is reported to have been made in Norwich Cathedral. While excavations were being made in the neighbourhood of the Lyhart screen the grave was discovered of the bishop who, it was stated, caused the present organ to be placed in the church. Several indications were found in the soil and upon the masonry of the fire which wrought such dire havoc in the Cathedral.

A CORRESPONDENT of the Municipal Journal suggests that in view of the high price of bricks municipalities should undertake brick-making for themselves. If the London County Council adopted this course it would, he says, by using the best modern appliances, save much in the cost of house construction, for bricks now are being retailed at enormous profits by the makers, and at a price far above their real cost of production.

EVERY freight-carrying wagon on every Russian railway is to be equipped with the Westinghouse brake. No other country in Europe has taken such a step or contemplates it. In the United States, however, all freight trains are being equipped with these automatic air-pressure brakes. The Russian Government has insisted that the brakes shall be made in Russia, and an important factory is now being erected in St. Petersburg.

DURING the ten years 1889-98, over 1200 students have attended the Building Construction Classes at the City of London College under Prof. Henry Adams, and nearly one half have sat for the Science and Art Department Examination, with a resulting success averaging 50.28 per cent. in the elementary stage, 91.32 per cent. in the advanced stage, and 28.57 per cent. in the honours stage. This is believed to be a record achievement.

THE Hungarian Government has expressed a wish to purchase three works of the students of the Glasgow School of Art. These works are among a selection of gold, silver, and bronze medal drawings, recently on view at Buda-Pesth, and now on exhibition at Vienna. The works indicated are:—Gold medal design for wall paper by James Grimstone, silver medal design for a printed silk by Archibald Gibson, and silver medal design for a wall paper by Emmet Brady.

A DISCUSSION at the last meeting of the Poplar District Board elicited some remarkable facts. One of the insanitary courts consists of ten so-called houses, which were recently bought for £65. The new landlord at once raised the rents from 2s. 6d. each house to 5s. Within thirty years the property has changed hands no less than twenty-two times. In another case the Sanitary Committee had to light matches when they went into the rooms, although it was broad daylight.

MESSRS. LANCHESTER, STEWART, AND RICKARDS, the architects for the new Town Hall at Cardiff, have amended the plans they originally submitted. The amended design shows an increase of 6ft. in the height of the building. The front has also been extended by something like 21ft., and this allows of additional accommodation, but it also means that the expenditure will be increased by £30,000. Several internal alterations have been made on recommendations submitted to the architects by the committee.

LAST Saturday afternoon over forty students of the High School Building Construction classes visited the Glasgow Art Galleries, Kelvin Grove. The buildings are now well advanced; the steel roofing in many parts is being proceeded with; the sculptors are also busy, so that every effort is being made to enhance the appearance of the building. The interior is especially good, and when the shields of the various counties are represented on the spandrels of the arches, the effect should be magnificent. Messrs. Simpson and Milner Allen are the architects. Mr. George Monteith Fry kindly conducted the students over the huge edifice.

ENLARGEMENT

OF THE

Builders' Journal

AND

Architectural Record.

For the past four years one of the most attractive features of

THE BUILDERS' JOURNAL

has been the Art Supplement which has been issued weekly as an inset sheet. From time to time this Supplement has been increased by the addition of a second Double-Page Inset Sheet.

We have now pleasure in announcing that, in consequence of the continuous increase in circulation, the management have decided to make this a permanent feature. From the beginning of the new volume, which starts with next week's number, each issue of THE BUILDERS' JOURNAL will contain

Two Double-Page Plates as Inset Sheets.

In addition to this permanent enlargement, we shall introduce with next week's issue, dated February 8th, a number of improvements and new features, which will, we think, substantially increase the value and attractiveness of THE BUILDERS' JOURNAL and ARCHITECTURAL RECORD, and cannot fail to extend its already wide popularity.

Readers having friends amongst Architects, Builders, Contractors, or Craftsmen engaged in the Building Trades, who are not already subscribers to THE BUILDERS' JOURNAL and ARCHITECTURAL RECORD, may be doing them a service, as well as advancing the interests of the Journal, by introducing to their notice

NEXT WEEK'S ISSUE,

No. CCIX., dated February 8th, the first number of the enlarged and improved series, and of a new volume.

Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,
February 1st, 1899.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slats; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble church for every town in England; such a church as it should be a joy and a blessing ever to pass near in our daily ways and walks, as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

IN our report of last week's meeting at the R.I.B.A., reference was made to the way in which the dissatisfaction caused by the Soane medallion award was treated by the authorities. It appears that a more formal protest than that made at the meeting had already been presented. This took the form of a written document addressed to the Council. The method adopted by the sixty-five dissentients who sign the document is that known as the "deadly parallel" and certainly it proves very deadly in this case; by setting forth in parallel columns the requirements of the London Building Acts and the ways in which these requirements were treated in the winning design, the memorial shows them to have been contravened in no less than eighteen instances. No direct reference was made to this memorial at the meeting last week, the authorities having apparently decided that a hushing-up policy was the most prudent to adopt.

WHILE we agree with the criticisms passed on the action of the judges in the matter of this award, we gladly recognise that the prize design is a work of great promise and full of interesting points. We make no apology, therefore, for reproducing this much discussed design in our pages this week. We deal with the subject from another point of view in our leading columns, and we would call attention also to a letter in our correspondence columns referring to the conditions laid down in the case of last year's competition for the Soane Medallion. We shall give in our next two issues a further selection from the more interesting of the prize-winning drawings.

THE old Bargate at Southampton, which was threatened with destruction, is to be preserved after all. This is matter for sincere congratulation, for the structure is one of great historic interest, besides being a picturesque feature of the town. The Daily Chronicle of last Saturday contained a very fine drawing of the gate by Mr. Hedley Pitton, together with some interesting historical particulars. From these it appears that the Bargate is supposed to have been erected soon after the Conquest, and was added to in various reigns, until it was completed by Edward III. It apparently formed one of the principal fortifications of the old town wall, of which there are still many curious remains tucked away out of sight. The dingy rooms over the arches are now used for the holding of the Quarter Sessions, but in the Middle Ages they were used as the meeting place of the all important guilds of the town. As one might suppose, it was also the headquarters of the old Southampton municipal fathers, and is still used for the safe keeping of a number of quaint and interesting records, in which Southampton is rich.

THE reason for the proposed demolition of the Bargate was that—like the old Temple Bar in London—it obstructed the traffic. It stands on the route of a projected electric tramway, and is too narrow to allow of more than one tram passing through at the same time. One way out of the difficulty that has been suggested is that the Corporation should buy property on either side of the gate and create a circus for the tramway. Whether or not this plan is adopted, the Corporation—yielding to strong pressure both from the citizens of Southampton and from artists, architects, and archaeologists throughout the country—has definitely decided that this fine old relic shall still adorn its ancient site.

THE students of the Royal Academy have had the privilege of listening to "a straight talk" by Sir William Richmond. Lecturing last Thursday on "Character in Portrait Painting," he remarked that he saw signs that vicious principles of workmanship were getting hold of them, which, if not arrested, would deter their growth as artists and diminish their final chances of success. It was strange that, while the sculptor students steadily advanced, gained in style, in design, and technique, the painters' work deteriorated. They were going the wrong way to attain excellence, and if they persisted in the manner of their going they would make it difficult for themselves, when they wished to do so, to recover lost ground. When they desired to gain restraint and dignity of workmanship it would be too late. Slovenly habits were not easily eradicated, and to slovenly habits it was only too easy to arrive. If the student of painting was ever to become a master he must learn his trade, and it was a very difficult one; a carpenter had to learn his, a bootmaker his, and they must learn theirs. To the elastic and rather flighty mind of the modern student severe training was apt to be a dull operation, but to learn a difficult trade, and one which combined so many qualities, a severe training was necessary. Great art was always highly finished, always complete, always workmanlike; never ephemeral or hasty. The real artist was modest and searching, not self-assertive or vain; he hated tricks; he feared the peril of facility; he cultivated patience and yearned more and more deeply to learn ever more and more of Nature's mysteries. Let them study the great masters, give up trying to be clever, learn to draw and paint well, and not smear.

THE Richmond Town Council has issued a very useful report on the Housing of the Working Classes. It has been prepared by Alderman Thompson, the originator of the Richmond housing schemes. In addition to a full description of the Richmond Municipal Cottages, it gives particulars as to cost of site and buildings in other similar cottages, and it deals fully with the questions of rents, repairs, working expenses, losses of rent, and other financial aspects of municipal housing. Suggestions are given on rural housing, standard rentals, grants in aid of cottage rates, utilisation of surplus middle-class houses for workmen's dwellings, and the provision of old-age pensions from the rents of municipal cottages. There are also plans and illustrations of municipal dwellings at Hornsey, Birmingham, Liverpool, West Ham, and Salford. The Richmond housing scheme seems to have been singularly successful, for we are told that a large number of the working classes are getting better and healthier and cheaper accommodation than they used to have. At the same time the scheme has not, and will not, cost the ratepayers a single penny.

IN view of the resolution with respect to the design for the new Vauxhall Bridge, passed at the last meeting of the Architectural Association, and recorded in our columns last week, a statement by the president of the Association, Mr. G. H. Fellowes Prynne, as to the grounds on which the design is objected to will be of interest. "The original design," said Mr. Prynne, in reply to an interviewer, "was

prepared by Mr. Ernest George, but the County Council decided to accept the design of their engineer-in-chief, Sir Alexander Binnie. We do not in the least find fault with the structural features of the bridge, but there is a unanimous feeling among artistic men that the design is inappropriate. It is not ornamental, and what we desire is to see beauty combined with strength and stability. The ornamentation of the bridge, as at present designed, is vulgar and altogether out of character, and we strongly suggest that the County Council should consult with the members of the Institute of Engineers and the Institute of Architects in order to obtain a combination which will be at least happy in its results. The bridges over the Thames have been so badly cared for in the past that it seems a great pity that the grand opportunity which now presents itself of building a bridge worthy of London should be thrown away. Of course, we have no personal feeling in the matter at all, as we fully appreciate the great engineering skill of Sir Alexander Binnie. But it is perfectly possible to combine the artistic features of Mr. George's design with the structural features in Sir Alexander Binnie's."

SOME interesting finds have been made during the excavation of Tell Zakariya, which there are reasons for supposing is to be identified with Gath of the Old Testament, the City of Goliath the Philistine. The finds include stone implements, such as corn-grinders, hammer-stones, pestles, and mortars; iron and bronze arrows, chisels, and needles; a jar containing a number of beads and scarabs; also a few coins. The work of excavation is described in detail in the quarterly statement of the Palestine Exploration Fund; the operations now in hand include a contoured survey of the Tell, and the excavation of a large building on its summit.

SOME slight alterations are in progress at the Tower of London. The building which stands on the right-hand side of the way just before one reaches the steps leading to the Tower green is being demolished. The structure is not part of the ancient castle; it was only put up eighty years ago, and has been used as a guard room. It has become almost dangerous, and when it was last occupied, for the purposes of a treat to the children of the garrison, the floor had to be strongly propped for fear of a disaster. The Royal Engineers are superintending the work, and it has been found necessary to dig the new foundations much deeper, and make changes in the drainage. All the soil removed is being carefully sifted for discoveries of antiquarian interest. The new building, which will be erected on the site of this old guardroom, will be in the fullest harmony with the rest of the fortress, but will afford greater accommodation and comfort to those who will occupy it.

AT last week's meeting of the London County Council the Works Department was again under discussion. As one explanation of the fact that on certain jobs undertaken by the Department, the expenses exceeded the estimate, Mr. John Burns put forward the theory that these men who are paid good salaries harass the workmen by their excessive interference. A correspondent of the Municipal Journal writing over the signature "A Twenty-two Years Foreman" endorses this view:—"The consequence, he says, is that the men get blamed for delay which is not their fault. He adds: "Works are done better now than ever they were, and workmen also are better." We are afraid this is not quite a universal truth, though we are quite prepared to believe that many of the charges made against workmen of laziness and incompetence are greatly exaggerated.

BATH ABBEY is the latest of our great churches to pass into the hands of the restorer. There is every probability, however, that the restoration will be carried out in a careful and conservative spirit. It is the famous west front which is chiefly in need of restoration.

An influential meeting, presided over by the Bishop of Bath and Wells was held last week at the Guildhall, Bath, to consider the question. A resolution authorising the Rector and Churchwardens to take the necessary steps was passed, and committees were appointed. The Bishop said they aimed more at the repair of what already existed than restoration with a free hand.

AFTER much discussion the Town Council of Aberdeen has decided to remove Greyfriars' Church from the quadrangle of Marischal College in order to facilitate the extension of the University buildings. This decision is to be deplored on more grounds than one. As was pointed out by Dr. Ferguson in a paper read before the Aberdeen Ecclesiological Society, Greyfriars' Church is a unique specimen of Gothic pre-Reformation Architecture, and is in fact the only remaining relic left in Aberdeen of a style of Architecture that seems to have become an unknown art. Dr. Ferguson thought the retention of this venerable and beautiful church would add immensely to the interest of the extended University buildings; and he expressed a hope that even yet the sacrilegious act might be prevented, and the city spared the disgrace of destroying so old and so interesting a building. Another reason which makes the "removal"—which probably means destruction—of the old church a matter for sincere regret is that it is the only remaining part of the buildings that originally belonged to the University.

THE extensive repairs to Winchester Cathedral which were commenced in April, 1896, are approaching completion, but the funds subscribed for the work fall short by about £4400 of the £12,000 required. The Dean of Winchester has written to the Times appealing for further contributions. The work at present completed, says the Dean, includes the whole of the main roof of the nave, and the stone vaulting which was in a critical and dangerous condition, the north transept and its aisles, the choir and the south aisle of the same, together with some repairs to the timber of the central tower. The further repairs not yet begun include the roof of the south aisle of the nave, the large flat roof of the retrochoir and its aisle, and the roof of the eastern aisle of the south transept. When these are finished the whole of the main fabric of this vast cathedral will have been put into a state of such sound and solid repair as will, it is hoped, secure its stability for many generations to come.

At the annual meeting and distribution of Prizes of the Glasgow School of Art, held last week in the Corporation Art Galleries, the fifty-sixth annual report was submitted. The work of the School during the session has been very satisfactory. For the second year in succession the school has taken the first place in national competition, having been awarded the greatest number of medals—thirty-two in all—given to any School of Art in the kingdom. In addition, a great number of other distinctions have been gained. The number of students enrolled was 618, an increase of twenty-four on the enrolments of the previous session. A new Art school is now being built, and when this is completed the School will be able to develop its operations in several directions, and will, it is hoped, accomplish even better work than it has done hitherto.

A MEMORIAL window of stained glass has been placed in the gable of the western transept of West St. Giles', Meadows, Edinburgh. The window is one of three lights, with tracery openings above, and the bulk of the space thus afforded for decorative treatment is occupied by a subject, "Christ blessing little children," which fills the main portion of the three lights. The principal panels in the tracery contain small figures of angels in attitudes of prayer and praise. The composition, containing upwards of twenty figures, is well balanced both as regards colour and design. The scheme of colouring adopted is one which will not darken the church too much.

Professional Items.

BRADFORD.—The new Empire Theatre at Bradford was opened for the first time last Monday week. The whole work has been carried out from the plans of Mr. W. G. R. Sprague, of London. The general style of decoration used throughout is Arabesque, and the colours employed are a delicate light blue, red, and gold. The vestibule is handsomely ornamented on this principle, and with the vestibule is connected a foyer or crush-room, 40ft. square, in which there are ninety arches, supported by thirty-two pillars; in numerous places appear the Arabic words "Behold the Temple of the Gods;" the illumination is by twenty Oriental electric lamps. Leading out of the foyer are various retiring-rooms and the entrances to nearly all parts of the music-hall. From the side opposite to the vestibule a marble staircase, with ferneries, ascends to the grand circle. The design of the auditorium is one more familiar to London than to provincial theatre-goers. There are no pillars in the building, and the grand circle and balcony come forward so as to completely cover the pit and part of the stalls. The total sitting accommodation is for 2000 persons. The stage is 60ft. wide and 40ft. deep, with a proscenium of 30ft. There is a fireproof curtain, and throughout the building the amplest provision is made to secure the safety of the public and of the artistes in case of fire. The contractors who have been engaged are—builders, Messrs. Howe, West Hartlepool; plastic decoration and artists' work, Messrs. De Jong, London; furnishing and upholstery, Messrs. Cranston and Elliott, Edinburgh; steel construction, Messrs. Bladen and Co., Glasgow; electric lighting, Messrs. Sax Slatter, London; gas arrangements and heating, Messrs. Vaughan and Brown, London; fire curtain, hydrants, &c., Messrs. Shand and Mason, London; and stage, Mr. Wood, London; while Mr. Swain has acted throughout as clerk of works.

DERBY.—A new Board school was opened last week by Sir Henry Bemrose, M.P. The building forms part of a scheme which, when completed, will accommodate 1800 children, and will eventually cover an area of about three acres. It will include a school for manual instruction and a cookery school. The block now built is two stories in height, with heating chamber in the basement, and is arranged to accommodate 720 children. It is planned with a large hall on each floor in the centre, with classrooms opening directly out of it, and is a combination of the central hall and corridor systems. Externally, the whole of the buildings are of brick, with terra-cotta dressings, and with Hopton stone sills and steps. The architects were Messrs. Naylor and Sale, Irongate, Derby. The builder was Mr. Alfred Smith, of Gordon Road, Derby. The lighting and wrought ironwork was done by Mr. E. Haslam, St. Helen's Street, Derby; the heating by Messrs. Jerram and Co., Babington Lane; and the ventilation by Messrs. Cousland and Mackay, of Glasgow. The cost of the present building, with the furniture, is £11,500.

EBBW VALE.—The foundation stone of St. Mary's Church, Victoria, in the parish of Ebbw Vale, was laid last week by the Bishop of Llandaff. The church will consist of a nave, chancel, and south porch, with small vestry on the north side of chancel. The style is a simple one of Early English character; lancet windows with red brick arches and quoins, the general walling being of local grey stone. The roof is of deal, open timbered and covered with green slates, finished by a red terra-cotta ridge, crest, and gabled crosses. The interior affords accommodation for 256 persons, and is furnished with deal open seats, stalls, and pulpit. The heating is effected by hot air apparatus. The church has been designed with the greatest simplicity of detail and economy of cost consistent with sound construction and correct ecclesiastical character. Mr. Bruce Vaughan, F.R.I.B.A., of Cardiff, is the architect, and the

contract has been taken by Mr. S. D. Davies, builder, Ebbw Vale.

LEITH.—Leith Hospital is to be enlarged in commemoration of the Queen's Diamond Jubilee. The elevation of the new building shows a frontage to King's Street on the lines of the existing elevation to that street, but it is treated in a less severe style, and terminates with an ornamental gable and oriel window, with balustrading. Besides providing further accommodation for patients, the additions will include a new kitchen, laundry, and nurses' home. Plant for steam power will be put down for the kitchen and laundry, and it is intended to provide an installation of the electric light and motive power for lifts. The total cost of the new buildings, including machinery and plant, is estimated at between £17,000 and £20,000. The plans have been prepared by Mr. W. N. Thomson, architect, Leith.

NOTTINGHAM.—The Nottingham and County Constitutional Club was formally opened on January 25th by the Duke and Duchess of Portland. The building has been about two years in course of erection. The competitive design has been practically carried out in its entirety, and includes the following accommodation:—On the ground floor: Ladies' room, entered from the first vestibule and divided from the club proper by an entrance screen overlooked by the porters' room, smoke room, and billiard room for three tables, with large lantern light over, and bar serving room. On the first floor: Dining room, with large circular Oriel window and balconies, which occupies the whole of the Market Street frontage, private dining room, committee room, writing room, reading room, and two card rooms, with serving room and butler's pantry. On the second floor: Five members' bedrooms, stewards' rooms, secretary's office, kitchen, scullery, and servants' hall. Servants' bed and bath rooms occupy the third floor. Connected with the club, but divided from it by two doors, is a large assembly hall which has a special entrance and emergency exit into the street at the back, and will accommodate about 250 people. The main entrance hall measures 26ft. by 25ft., and is well lighted with a large lantern (15ft. square) of stained glass. The main staircase, 6ft. wide, is built of yellow Mansfield stone with York stone steps; a circular Oriel balcony, with carved panels and Royal Arms over an elliptical arch carried on Fuglevik granite columns and pedestals with Ionic caps, is a feature of the hall. Three large sets of lavatories and conveniences are provided, and a skittle alley, 50ft. long, under the entrance hall is reached by a staircase under the main stairs. The front entrance porch is panelled with black Kilkenny and Languedoc marbles. The frontage is built of Derbyshire stone from Darley Dale in the Renaissance style, treated with one bold and massive gable, which rises to a height of about 70ft. The principal entrance has a carved hood, supported on massive corbels; a special feature has been made with a large circular Oriel window on the first floor, with balconies on each side, commanding an excellent view up and down the thoroughfare. The contractor for foundations was Mr. W. Woodsend, and for the upper portion, Mr. J. Hutchinson. The architect is W. A. R. Calvert, F.S.I., of Nottingham, who won the work in competition, assisted by Mr. W. R. Gleave, A.R.I.B.A., who has also acted as the Clerk of Works.

MR. C. D. RUDD'S Ardnamurchan Estate in Argyleshire is being extensively improved. Sheilbridge Lodge—a somewhat antiquated building—has been pulled down, and is being replaced by a much more commodious and slightly structure. Glenborrodale Castle, erected about forty years ago, has been razed to the ground, and the contracts have been placed for a splendid mansion-house on its site, at a cost of something like £37,000. Certain additions and alterations are also to be carried out in connection with Kilchoan shooting lodge. A rich stratum of iron ore has been found on the estate, and mining work will begin in a few weeks.

Views and Reviews.

CABINET-MAKING FOR AMATEURS.

This is the latest addition to the extensive series of "Handbooks for Amateur Mechanics," emanating from the well-known offices of The Bazaar, Exchange, and Mart. This house has long made a speciality of catering for that numerous body of people, drawn from all classes of society who seek to dabble in the mysteries of trades, callings, and crafts widely differing from their ordinary occupations. Strange indeed must be the requirements of the "hobbyist" that Mr. Upcott Gill cannot meet—from stamp collecting to stud farming, from conjuring to cucumber culture—all tastes are duly considered. The editor of the work with which we have to deal takes the embryo cabinet-maker figuratively speaking by the ear, and initiates him into the secrets of furniture making—fancy, and otherwise. We must confess, however, that the manipulations and material described approximate more nearly to the productions of Curtain Road than to those of our Gillows, Hamptons, and Waring's. The ways and means to the conversion of egg-boxes into fashionable wardrobes, washstands and what-nots, may possibly afford a welcome distraction to the struggling young architect anxiously awaiting, with that sickness of heart, that comes of hope long deferred, the decision of the "Competition Committee" relative to his last Set: or if he be already the happy possessor of abundant commissions, he may obtain some mental relief and bodily exercise in the attempt to transform an empty beer or soda barrel into a cosy arm chair! How this, and some sixty other pieces of house furniture, can be manufactured at home, by persons of ordinary intelligence and some little leisure, may be discovered in these pages; the explanations are comprehensive and lucid, and are copiously illustrated. The chapter on "Tools and their Selection" is much above the average in point of quality, and is evidently the work of an expert; much useful information is set down, and the amateur woodworker will do well to make himself master of its contents before making his purchases. The article on glue is also worthy of careful attention, and whilst we cordially agree with the writer's remarks upon the ill results of using unseasoned wood, we think his instance of the drawer bottom scarcely a happy one; for the front edge of a drawer bottom should most certainly be fixed; it is the sides and back edge that it is requisite to leave with freedom of movement. We may also remark that, in these days of universal elementary education, it should not be possible, even in a work intended for amateurs, to confound pine with spruce.

"Cabinet Making for Amateurs," by J. P. Arkwright & L. Upcott Gill, 170, Strand. Price 2s. 6d.

PERSPECTIVE DRAWING.

This book deals exhaustively with the methods of perspective, as it is understood and practised in schools of art. The author states that the design of the work is to provide information on perspective to every class; to those who require the rudiments of the subject, as well as to those who desire a complete course of instruction. For this purpose the book has been divided up, so that those wishing to obtain a general knowledge of the subject, without going deeply into detail, may find what they want without working through the whole book. At the end we find chapters dealing with Aerial Perspective, Perspective Hints to Artists (i.e., Painters), Perspective for Architects and Engineers, Photographic Perspective. It also contains the necessary information for the Science and Art examinations, the Oxford and Cambridge examinations, and for those of the College of Preceptors.

We must say that, so far as we know, this book does give most complete information for these examinations; but, as a complete work on Perspective, it seems to fall short in this essential point, that a student might have the

contents of this book at his fingers' ends, might even know it all by heart, and yet might have no true conception of what perspective is, or where it begins and ends, or under what conditions these methods are true, or how very limited is their practical application.

For instance, we find numerous little problems in which a single object, such as a cube, is shown so many feet to the left or right of the centre of vision, or so much above or below, but the author does not explain that when the average man—not being a professor of perspective—wants to know what a thing looks like, he looks straight at it, not so many feet to left or right, or above, or below, but straight at it; and that although it is most ingenious to be able to explain what a thing is like when you carefully avoid to look at it, yet this is of no particular use to anyone. What you want to know is what a thing looks like when you *are* looking at it.

By-the-way, the author demonstrates that a sphere is not a sphere, but an ellipse, when you do not look at it, which is interesting but not very helpful.

In the chapter on Perspective for Architects we notice that the author has observed the ordinary architect's curious habit of looking straight at anything he wishes to see, and rebukes it. The effect is more pleasing, he considers, when you look at it obliquely. Fix your eye, for instance, on the nearest angle of a long façade, if you want a pleasing general view, do not look at the centre.

Again, "bird's-eye views, we are told, are simply perspective views drawn with a very high horizon line," and to illustrate this a view is given of a track of country with a church, from a height of 500ft., with a centre of vision on a distinct horizon line. Now if anyone takes the trouble to get to a height like this—by balloon or otherwise—to obtain a general view of a group of buildings with their surroundings, he does not proceed to fix his eye on the distant horizon in order to see what the buildings look like, he does something much simpler, he just looks down, regardless of the methods of Science and Art perspective, and totally unconscious of the fact that by doing so he is taking unwarrantable liberties with his horizon line, and making the tower of the church look bigger at the top than at the bottom. As the author remarks elsewhere, *apropos* of towers, "these misconceptions are great stumbling-blocks to the proper appreciation of perspective," and the author might have given them more attention. In short, we find this system of perspective well developed, but not sufficient explanation of its value or its limitations.

While it is necessary to practical success that students should pass such examinations as those of the Science and Art Department and the Oxford and Cambridge Local Boards, and while this subject continues to be handled in the way it now is for the purposes of these examinations, those desiring to pass them will find this book of great value and assistance, but the architect must approach it from a different point of view. A. R. J.

"Complete Perspective Course," By J. Humphrey Spanton. Macmillan and Co. Limited, 1898.

TWO CATHEDRALS.

Here we have two of Messrs. Bell's "Cathedral Handbooks," some of which have already been reviewed in these pages from time to time. While, of course, the series is written for the general public, rather than for the architect, the illustrations and the industrious compilation evident throughout render the pages interesting even to members of the profession who may almost be said to know our English cathedrals by heart; while in the condensed form in which the story of the various minsters is presented, a general view of their career may be readily gained—a thing not to be done in the reading of the more ponderous works of Professor Willis, Rickman, and others who have set out to treat of each individual cathedral *in extenso*.

While we can say thus much for the convenient and portable form of these handbooks, we cannot say that the architect, glancing over their pages, will find much that is new,

nor will he discover in the architectural pronouncements the voice of an authority on the art of Architecture.

Mr. Sergeant's work in the book on Winchester now before us exemplifies these remarks to the full. His 132 pages are a maze of quotations from the many persons who, from Willis and Britton downwards, have written on this magnificent fane. The fact testifies to his industry and the extent of his reading, even if at the same time we find the obvious fault of haphazard plan as the result. You cannot quote continually, and string your quotations together with a few undistinguished and non-committal phrases, and yet produce a book that shall be eminently readable.

Winchester Cathedral is, as is proper in a minster that was once the cathedral church of the Capital of England, the longest ecclesiastical building in the kingdom: measuring, as it does, from the west front to the eastern wall of the lady chapel, no less than 556ft. This great length is the more apparent to the exterior view than it would otherwise be, on account of the long, severe, almost unbroken skyline, resulting from Winchester lacking a central tower of any striking height. The existing tower at the crossing is an example of late Norman work, plain and massive, and with a flat skyline that cannot by any stretch of imagination be termed picturesque. Thus we find Mr. Sergeant echoing the disappointment of many writers who at Winchester expect to find the "picturesqueness" that the three grouped towers of Canterbury Cathedral, for instance, give. There is no need for this feeling. Indeed, the history of this sturdy severe tower, gives it a picturesqueness all its own, when the facts are known—how, fourteen years after its predecessor was built (in 1093) it fell suddenly in utter ruin, because, as some were found to believe, the body of the wicked Red King had been buried beneath it. The superstitious folk of those times knew nothing of foundations, or of piers insufficiently strong to stand the crushing weight of masonry. Rufus, "whom God abhorred," was buried at the crossing, and therefore, as a judgment upon this sacrilege, the tower fell upon his grave. The builders, however, knew better, for they kept the grave of the unshriven king there, and they rebuilt the tower with more substantial piers, putting, at the same time, less weight upon them than they had formerly to bear.

The writer of this review finds it a somewhat singular fact that, in these two handbooks on Winchester and Lichfield Cathedrals, one has, side by side, perhaps the most uncompromising sternness and the most delicate beauty of exterior to be found among the Cathedrals of England.

If Winchester presents certain masculine and rugged qualities above all others, Lichfield must certainly be regarded as almost feminine in its graceful beauty, with its gloriously tabernacled west front, and those three needle spires that form a lovely composition, from whatever quarter they are viewed. It is possible not to read, in the course of Mr. A. B. Clifton's account of this Cathedral Church of St. Chad, a certain enthusiasm he must possess for his subject; for the story moves as a well-ordered whole; comparable, it may be said, to a close-coupled express train, as against the loosely-bound-together "slow goods" of Mr. Sergeant's account of Winchester.

Lichfield Cathedral, as against the bulk of Winchester, is Early English versus Norman; for although Winchester is a compendium of the architectural periods from Norman to Perpendicular, and though Lichfield is in great part Decorated, we must needs take the heaviness of the former and the light and graceful style of the latter to stand for all that was solemn in Romanesque, and all that was gracious and aspiring in First Pointed. We have not the space here to follow the fortunes of Lichfield Cathedral from its foundation to the severe handling it underwent in the times of the struggle between King Charles and his Parliament, when the great central tower and spire were thrown down. Mr. Clifton tells the story very

ably, and we commend to architects what he has to say respecting the replacing of that feature. Also let it be said that he shows a healthy (though perhaps over-guarded) criticism of Sir James Wyatt and Sir Gilbert Scott. Wyatt has been dead very many years, and his work has long since been the laughing-stock or the despair of succeeding generations; and in this year of grace it is surely needless to hesitate before criticising Scott, for at this lapse of time no one could be pained, while his architectural enormities are no new-found things.

Correspondence.

THE SOANE MEDALLION AWARD.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—May I be allowed to refer to your criticism in THE BUILDERS' JOURNAL of last week, on the R.I.B.A. award. You there call attention to the poverty of design exhibited by the competitors last year. This, you may not be aware, was not their fault entirely. The conditions for the competition were framed to require a concert hall for 3000 persons and a chamber concert hall, each with separate stairs, &c., &c., all on a site only 100ft. by 160ft., only two frontages of which were available for windows. The result was that when all the conditions were adhered to the building took a very simple utilitarian form with little or no chance for artistic feeling. In fact, the site was far too small, and no doubt the R.I.B.A. Council recognised their blunder and this year asked for a concert hall on a site 200ft. by 120ft., with four available frontages for 2500 persons. Your remark that the R.I.B.A. gave this year a similar subject to that of last year might, I would suggest, need amplification.—I am, Yours truly,

CHAS. A. DAUBNEY.

Peckham, S.E.

Enquiry Department.

BOOKS ON SURVEYING.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I am desirous of getting a recent work on levelling and surveying, and shall be glad to know what are the best on those subjects, together with the price and when published. I do not want anything too expensive, but something that will give the latest methods in use. You had some very interesting articles on the subject in your valuable paper some time ago.—Yours, &c.,

"UP-TO-DATE."

The author of the articles on surveying, which we have published, has written a book on the subject—"Surveying and Surveying Instruments," by G. A. T. Middleton, price 4s. 6d. Baker's "Surveying" is also a well-known and cheap book, a new edition of which has recently been reviewed by us; while Usill's "Land Surveying" deals more than either of these with trigonometry as applied to surveying work.

SOOT COMING THROUGH PLASTER.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I have just pulled two large chimneys down in an old house covering about 14ft. of each gable. As the new chimneys will cover the whole of the space, I must do something to prevent the soot coming through the plaster. Can you tell me of anything I can do to prevent this.—Yours truly,

J. W. N.

Baconsthorpe.

The only safe method of preventing the soot from striking through the plaster is to chip or cut away the entire surface of the old flues.

Under Discussion.

HINTS TO YOUNG ARCHITECTS.

The opening meeting and lecture under the auspices of the Dundee Institute of Architecture, Students' Section, was held last Saturday week, when Mr. T. Martin Cappon, F.R.I.B.A., delivered the opening address. In the course of his remarks, Mr. Cappon impressed upon the students the great importance of the architectural art, the magnitude and extent of its influence and bearing upon the history of humanity. Architecture, in the general sense of the word, was the art of erecting durable, commodious, beautiful, and handsome buildings of all kinds. Architecture could be divided into civil, military, and naval classes, any one of which gave scope for endless study and instruction. Architecture had become by degrees a fine art, differing from the other fine arts in the respect that it was based upon utility, and that it elevated mathematical laws to rules of beauty. Painting and sculpture were only the expression of the feeling of the beautiful, and any creation of Architecture must appear to have utility in view. Every feature should have a meaning, and every part of a building ought to show the purpose for which it was designed. Architecture was a development of constructive art, with nature as its ideal for proportion and beauty, and each nation had interpreted the art according to its climatic conditions, the materials found in it its natural characteristics, and such other influences as colonisation, commerce, or conquest brought to bear upon them. No one would deny that a very great improvement had taken place in the character of Architecture during the last century. They must place their whole heart in their Profession, work hard, and be determined to succeed.—Mr. Cappon devoted the remainder of his address to giving practical hints on different branches of the architect's work.

ELECTRIC LIGHTING AND MOTOR CARS.

Mr. W. H. Preece, the engineer, of the General Post Office, took the chair at the Automobile Club last week, when a paper on "Accumulators" was read by Mr. Northey. During the discussion various comparisons were made as to the charges by electric lighting companies for power, which, it appeared, was usually 3d. a unit, though the Shoreditch and St. Pancras Vestries charged one penny less. Mr. Preece, however, informed the members that Edinburgh was the ideal place for the electric motorcar, for in that city the Corporation would supply any quantity of electricity for 1½d. per unit. Mr. Preece added that the proprietors of the Scotsman intended to work the whole of their printing presses by electric motors. The progress made by the Post Office in dealing with the question of the supersession of horse traction by automotors was touched upon by some officials of the department, and one of the members of the committee appointed by the Postmaster-General to consider the question, stated that, as soon as anyone could offer to do the work at the present cost, the better they would be pleased. They were willing to give every encouragement to inventors, and they had an open mind as to whether the vehicles should be propelled by oil, gas, steam, or electricity. Already several types had been tested, and one at least worked very well.

THE CAUSES OF LEAD POISONING.

At the annual meeting of the Yorkshire Branch of the Sanitary Inspectors' Association, held at the Halifax Town Hall, on January 21st., Mr. W. Ackroyd, F.I.C., read a paper on "Lead Poisoning, its Causes and its Prevention." He said all the waters reported to have plumbo-solvent properties in the West Riding of Yorkshire were derived from moorland gathering grounds. For years he had regarded the acidity which was derived from peat as the cause of the action of the water on lead.

Samples collected from the various Halifax reservoirs showed that a very acid water acted quickly on lead, and that waters of slight acidity acted only slowly. The acidity was an extremely weak one even in the strongest cases. The sense of taste did not detect it. An analysis of the causes of the comparative immunity from plumbism in the Calder Valley and Halifax was of hygienic importance, especially as the water was not filtered. The water at its source was not much over one unit in acidity, the black sheep in the system, Fly Flats, being excluded. Numerous springs mixed with the water on its way to the centre of distribution, lessening its plumbo-solvent action, and lead piping was kept down to its minimum length. The length of lead piping from the iron main to the house was an important point. Mr. Ackroyd urged that the quality of all moorland waters should be examined often; indeed, the importance of the subject was sufficient to warrant daily observations being made by all great water-trading Corporations. He had recently proved that the configuration of a gathering ground might be conducive to the plumbo-solvent quality of water collected on it. The very acid water reached one of the Halifax reservoirs by an incline of 1 in 40, and in another of one-fifth the acidity by slopes of not more than 1 in 12. A common-sense inference in the former case would be that the lessening of the length of ground or peat through which the water passed would reduce the acidity to a proportionate degree, or, in other words, two or more parallel catchwater drains instead of one would lessen the plumbo-solvent quality of the water. Filtration on a large scale might lessen the acidity of water if the construction of the filter beds was based on the results of previous experiments in the chemist's laboratory. On the other hand, there were advocates of the less expensive course of simply adding precipitated calcium carbonate to the slight extent of about two grains per gallon, with a rough filtering afterwards. Sanitary authorities ought to prevent the use of lead pipes in wells of plumbo-solvent water, just as decisively as they prohibited the use of lead cisterns in some places for storage purposes.

HOW COAL GAS IS MADE.

Mr. William M. Thomson read a paper on January 19th to the members of the Dundee Institute of Engineers, in Lamb's Hotel, on "The Manufacture of Coal Gas." Mr. Thomson outlined the early history of gas manufacture, giving due prominence to what the world owed to William Murdoch, whom he described as the inventor of gas lighting, and, next to Burns, Ayrshire's greatest son. Not only did he take the initiative in employing gas as an illuminant, but to a certain extent he was the discoverer of the basis of the long series of aniline dyes which form so valuable a part of the bye-products of the distillation of coal. Mr. Thomson then proceeded to describe the plant employed in gas works, his remarks being elucidated by diagrams showing the various processes involved from the moment of carbonisation to the point when the gas passes from the gasometer to the consumer the bye-products and the uses to which they are applied being enumerated. At present 80 millions of capital was represented by the gas-producing plant of the country, and, notwithstanding the employment of electricity as an illuminant, a great future lay before the industry in its relation to motive power.

ARTISTIC HANDICRAFT.

The second of a series of lectures on "Some of the Arts and Crafts" was given at Manchester last week by Mr. C. R. Ashbee, of London. Mr. C. Rowley presided. Mr. Ashbee is the founder of the Guild and School of Handicraft at Essex House, and his lecture was on its work and methods. He said the work at Essex House was an experiment in the application of old-world methods in handicrafts to modern artistic and utilitarian requirements. There were two departments, the productive workshop and the department which concerned

itself with education in handicraft. Their aim was to turn out work that was not, so to speak, ear-marked with commercialism, and they were inspired very largely by the teaching of Ruskin. For the most part they produced things which might be described as subordinate to Architecture—objects of decorative art in the largest acceptance of the term, such as work in gold and silver and yellow metal, smith's work, the setting of precious stones, leather work, furniture and other internal fittings, and, in general, such things as could be done without the assistance of the machine. He did not decri machinery, but when it was introduced into a workshop it was apt to get out of control and destroy the possibilities of individual work. Machinery should be the slave and maid-of-all-work, but as a matter of fact it had made itself the master. The Guild had been carried on on the principle of an industrial partnership, but last year it had been made into a limited liability company, without, however, materially altering the old conditions. The three things they aimed at were—first, artistic quality in their work, then the quality of joy in production, which was dependent on the first condition; and, third, what he would call the human quality, which followed as a necessary consequence on number two.

A SINGLE RAIL EXPRESS ELECTRIC RAILWAY.

Under the auspices of the Liverpool Chamber of Commerce, Mr. F. B. Behr, A.I.C.E., described in detail his proposal to construct a single rail electric railway between Liverpool and Manchester, and pointed out the adaptability of the scheme for the rapid and safe transit of passengers. There were, he said,

comparatively few difficulties in connection with the construction of such a railway. The gradients between Liverpool and Manchester were specially suitable for attaining a very high speed with a moderate expenditure of electricity. He had made a very liberal estimate of the cost of constructing the line, which would be under £40,000, exclusive of the cost of the land and the entrance into Liverpool. If they put these two items down at, say, £1,000,000, which seemed to be ample, the total cost would be £1,400,000. If arrangements could be made with the Lancashire and North-Western, or the Lancashire and Yorkshire Railway, to enter Liverpool over their line, which could easily be done without interfering with the existing traffic, the cost would be materially reduced. He proposed that there should be 132 trains per day in both directions, and the journey would be performed in about eighteen minutes. This would be the cheapest railway which could be built as a practical test between two great towns. His idea was that one need only build this line to practically demonstrate the advantages resulting from the system, not only to the public, but also to the existing railway companies, for by freeing the existing railways from all express passenger trains the gain to these companies would be enormous, both financially and administratively. They would immensely increase the express passenger traffic by adding one of his lines to the present system, and at the same time they would be enabled to extend with perfect safety and economy their system of local trains, as well as their goods traffic. They would thereby also remove the principal cause of accident on their lines, the inter-mixture of high speed trains, with ordinary shunting and goods train operations.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

The fourth meeting of the session was held at the rooms in Sackville Street on January 18th, Mr. C. H. Compton, (vice-president), in the chair. Mrs. Collier exhibited some interesting drawings of pre-historic animals scratched upon reindeer horns, found at Perigord, in France. The first paper was contributed by the Rev. Arthur Courtenay Roberts, vicar of Dunmow, upon "An Essex Church Tower," and was read in his absence by Dr. Winstone. This tower belongs to the church of Great Dunmow, not the Dunmow of fitch of bacon celebrity. The church is of fine proportions, and possesses a very large chancel, the author's theory being that the chancel was built for right of sanctuary—the nave and tower being added later. A partial restoration was commenced in August last, when the plaster was removed and the original flint work exposed. This restoration has brought to light many interesting features, including the exterior of the old turret staircase, similar to those at Hadleigh, Ingatstone, and other churches in the eastern counties. The second paper was by Dr. W. de Gray Birch, F.S.A., entitled "Historical Notes on Ramsey Abbey MSS." The Benedictine Abbey of Ramsey, in Huntingdonshire, is believed to have been founded in or about A.D. 969 by Alwinus, a duke or earl of the East Anglians, at the instigation of Oswald, one of the most active archbishops who ever occupied the provincial chair of York Cathedral. The abbey stood at the upper end of the town, toward the south, at a little distance from the present church. The only remains existing are the ruined gateway, a rich specimen of florid Gothic, and some much older work in the kitchen of Lord de Ramsey's house.

CONTRACTS OPEN.

WILLESDEN DISTRICT COUNCIL.
TO BUILDERS.

The Willesden District Council are prepared to receive TENDERS for the EXTENSION of PUBLIC OFFICES in Dyne-road, Kilburn.

Plans and specification may be seen, and all further particulars obtained upon application to Mr. O. CLAUDE ROBSON, M.Inst.C.E., Engineer to the Council, Public Offices, Dyne-road, Kilburn, N.W.

Quantities, to be obtained from the Offices of the Council, will be supplied to competing builders upon the payment of £10 per copy, which sum will be returned upon receipt of a bona-fide Tender.

Tenders, endorsed "Public Offices," to be delivered at the Offices of the Council not later than FOUR p.m. on TUESDAY, FEBRUARY 14th, 1899.

The Council do not bind themselves to accept the lowest or any Tender.

By order,

STANLEY W. BALL,

Clerk to the Council.

Public Offices,

Dyne-road, Kilburn, N.W.

January 25th, 1899.

RUGBY URBAN DISTRICT COUNCIL.
PROPOSED PUBLIC OFFICES.
TO BUILDERS AND CONTRACTORS.

The Urban District Council of Rugby invite persons desirous of TENDERING for the ERECTION and COMPLETION of PUBLIC OFFICES on a site in High-street, Rugby, to send their names and addresses to the undersigned, when a copy of the bill of quantities, conditions and form of Tender will be forwarded on or about the 31st inst.

A deposit of Two Guineas, in cash or money orders, to be made at the same time to the Clerk of the Council as a guarantee of the bona-fides of the application, which sum will be returned on the receipt of a bona-fide Tender.

Sealed Tenders, endorsed "Public Offices," to be sent to Mr. T. M. WRATISLAW, Clerk to the Council, Windmill-lane, Rugby, on or before FEBRUARY 15th next.

The Council do not bind themselves to accept the lowest or any Tender.

By order,

D. G. MACDONALD, Assoc. M.Inst.C.E.

Surveyor to the Council.

Rugby,

January 9th, 1899.

Binding Cases may be had on application to the Manager. Price 1s. 9d. each.

Trade and Craft.

GENERAL ELECTRIC COMPANY LIMITED.

We have received from the General Electric Company the ninth edition of their comprehensive catalogue of electrical fixtures and glassware. This catalogue, which runs to over eight hundred large quarto pages, exemplifies the enormous variety of the work turned out by this branch of the Company's business, and well illustrates the vast scope of its field of manufacture and the wide range of the markets which it supplies. Although, compared with other businesses, the Company has been started at a relatively recent date, it has won a great success due to the fact that while it employs only experienced artists in procuring its many designs, the practical needs of each particular piece are held always in view, and no pains are spared to procure that it shall not only serve its purpose, but stand the rough usage which it is likely to receive at the hands of careless or ignorant cleaners and house-servants.

of the Company. We notice some ingenious devices in the way of cord shorteners, and also some detachable ball fittings, which seem to be admirably contrived. The Company, besides an enormous variety of pendants, counterweight fittings, electroliers and standards, both simple and ornate, show also a large selection of shop window and picture reflectors and outside brackets, and standards for incandescent and arc lamps. They exhibit, among others, some pieces which combine the purposes of a bracket for a hanging-lamp, and a sign, very aptly, and the opportunity for really effective design in wrought iron has been availed of with great success. The list, indeed, contains a large selection of various designs enriched with leaf work of copper, brass, and iron, all English made and wrought by hand. Besides designs such as these, which belong distinctly to the nineteenth century revival of art metal work, there are also many examples in the traditional styles, and architects and decorators should be able to find patterns to match any style of ornamentation in the Company's showrooms.

1840-60 these quarries were largely worked, and during that time earned a great reputation for the excellence of their stone, its beauty and regularity of colour, and its great durability. A great number of important buildings throughout the country have been built with this stone, including the Albert Memorial in Hyde Park, King's College Hospital, the Royal Exchange of Manchester, the Municipal Buildings and Art Galleries of Birmingham, and many others. In 1854 Sir Joseph Whitworth purchased the estate on which these quarries were situate and converted them into enormous rock gardens. After the death of Sir J. Whitworth, the whole estate, comprising about 1000 acres, was purchased by two local gentlemen—Mr. J. H. Dawson and Mr. T. C. Drabble—who are again developing these once famous quarries. The stone from the quarries hitherto worked by Mr. T. C. Drabble which also are being taken over by the Company—has been most extensively used in the construction of important buildings in various parts of the country, and is specified by leading architects and engineers as being most suitable for trying

Fig. 187. Elevation of head.

Fig. 188. PLAN OF HEAD.

Fig. 191. METHOD OF OBTAINING TRUE SHAPE OF VENEER FOR SPLATED CIRCULAR LINING.

PRACTICAL CARPENTRY AND JOINERY.

Thus the Company's art metal works, which, though situated in Birmingham are operated from London, are already among the largest of their kind devoted exclusively to the manufacture of electrical fixtures, and their 1898-99 catalogue constitutes a useful guide and a reference-book for electrical engineers, contractors and architects, both in this country and abroad. The numerous illustrations appearing in the pages of the catalogue are either reproductions of photographs of the various patterns, or careful and exact drawings, which can be relied on to give a true idea of each subject. Here are described and illustrated electric fittings and fixtures, and accessories which each from the strong practical requirements of factory or workshop, to the rich and costly designs which are demanded by the luxurious taste of a modern London mansion or club. The needs of ships, yachts, shops, offices, factories, and even trams, besides the innumerable wants of every class of public building and private house, with numerous new and ingenious accessories and labour-saving appliances, are met by the manufactures

We cannot close this notice without referring to the handsome bronze standards of real and imitation bronze, composed with figure subjects. Many of these are very beautiful, and in designing some of them to serve as newel standards, the Company has been happily inspired. These bronzes seem particularly well adapted to this purpose. We noticed in particular a design "Nilus," in which the draped figure of a girl holds stems of bullrushes in her hand whose characteristic fruit is in each case an incandescent glow-lamp. There are others designed upon this same graceful idea. The catalogue closes with a large selection from the Company's silk, paper, china, and cut glass shades, globes and envelopes, which seem to include everything that utility or taste should suggest.

THE ORIGINAL DARLEY DALE STONE CO.

An important development, and one of great interest to the building trades, has recently taken place in the reopening of the famous Darley Dale stone quarries. In the period

atmospheres and where stone is required to bear great strain. Mr. Tanner, of H.M. Office of Works, has used the Farley-Darley Dale stone for post-offices in Nottingham, London, Sheffield, and elsewhere. This stone was also used in the building of the Claybury Asylum, the Blackwall Tunnel approach arches, Wellingborough Viaduct, and in many other important structures. The quarries now being worked by the Company are: Standcliffe (the original Darley Dale stone), Hall Dale, Darley Dale, Farley (Darley Dale), Bentley Brook (Mattock), Mattock Moor, Cronford and High Peak. The stone is supplied either in the rough or dressed ready for fixing.

BRITISH SAFETY WINDOW SASH AND CASEMENT CO.

The combined sash and casement of the British Safety Window Sash and Casement Company Limited, 39, Broad Street, Bristol, appears to possess considerable merit. It received the highest awards at the Royal Cornwall Polytechnic Exhibition, 1895, and the International Inventions Exhibition,

"ACME" HEATING AND VENTILATION.

A DISCUSSION which should prove specially interesting is announced for next Wednesday (February 8th), at the Sanitary Institute, Parkes Museum, Margaret Street, W. The subject is the "Supply of Water to London by the Welsh scheme," to be introduced by Mr. E. E. Middleton, M.I.C.E. The chair will be taken by Sir Douglas Galton at eight o'clock.

This image shows a blank, aged, cream-colored page, likely an endpaper or flyleaf of a book. The paper has a slightly textured appearance with some minor creases and discoloration, characteristic of old paper. The left edge of the page is bound, showing the stitching or glue of the book's binding. There is no text or other markings on the page.

PRACTICAL CARPENTRY AND JOINERY.

BY GEORGE ELLIS.

(Concluded from page cæcv.)

*All rights reserved by the Author.

Divide the soffit edge of the head (Fig. 187), into a number of equal parts, as in the points 1, 2, 3, 4, 5, 6, etc., and project them into the plan to intersect the great chord line, A-B, in points 1'-2'-3' etc. Draw at any convenient place the line M-N (Fig. 190), representing the stretch out of the soffit line 1-6-1; this is done by running the dividers around the curve in short steps and setting off the same number upon the straight line; next transfer the spaces 1, 2, 3, etc., to the line and erect indefinite perpendiculars therefrom, upon these set off the distances 1'-a, a', 2'-b, b', etc., as they occur in the plan; upon the corresponding lines, and through the points thus found, draw the curved lines a, b, c, d, e, f, which will give the shape of the mould. This mould must be made of thin stuff, so that it may be bent around the soffit, and its edges will then give the plan curves. If such a door frame as the above has to be fitted with a plain splayed lining, the head would have to be bent on a "cylinder," which would be the half of a truncated cone and staved at the back as shown in Fig. 186. To obtain the shape of the veneer to bend around the "cylinder," proceed as follows: let A-C, D-B (Fig. 191), be the plan of the lining; produce the faces of the jambs to meet in the point E; join A-B and describe the semicircle A, 9, B; the triangle A, E, B, represents the plan of the generating half-cone, and A, 9, B, its elevation

FIG. 190. SOFFIT MOULD FOR HEAD OF FRAME.

Next, to draw the stretch out of the semi-circle; from E as centre, with A-E as radius, describe the arc A, 9', E, divide the semicircle into a number of equal parts, and set off these upon the arc in the points 1', 2', 3', etc.; from these points draw lines to E, and from points 1-2-3, etc., in the elevation draw perpendiculars to A-B. From these intersections draw lines to E, and from where these lines cross the plan curves of the lining, draw lines parallel to A-B to meet the side A-E. From E as centre, with these intersections as radii, describe the series of arcs shown in dotted lines, and through the points formed by the intersections of the arcs with the corresponding radial lines from points 1', 2', 3', etc., draw the curved lines, A-e and C-d, which will be the true shape of the veneer developed.

Sprung Mouldings.—To obtain an upright mitre at the intersection of arch and other curved mouldings with straight portions, either in the same plane or at an angle with it in plan, requires that different sections should be worked in the two parts. To determine the section of the curved part when the straight is given, let A-B (Fig. 192) be the section of the level moulding, and B C the elevation of the curved part; divide the profile A-B into a number of parts, and describe arcs therefrom concentric with B C. From the same points in A-B draw perpendiculars to intersect the horizontal line D-E with E as centre, and the points 1, 2, 3, etc., as radii describe arcs cutting B-C in 1', 2-3, etc., from

PRACTICAL CARPENTRY AND JOINERY.

E' draw a line to the centre of the curved part, and at the points where this line cuts the arcs in the elevation erect perpendiculars to E'-X; draw lines from the points 2'-3'-4' parallel to E'-X, and the intersections of these lines with the perpendiculars from the corresponding divisions will give points in the required curve. The intersection of straight and curved mouldings, when both are of the same section and lie in the same plane, results in a carved joint at the mitre as shown in Fig. 193. This may be found by laying down a section upon the seats of the mouldings, and drawing lines parallel with the edges of each through points in the section until they intersect; a line joining the intersections will give the shape of the mitre. If a straight mitre is desired, the two mouldings must be of differing sections, which can be found thus:—let C-D, (Fig. 194) be the sections of straight moulding, draw lines from all the members, parallel with the edge, at the points where these cut the mitre line; draw concentric arcs to the radial line M, and draw the perpendiculars 1, 2, 3, etc. Make these the same in height as the corresponding perpendiculars in C-D, and draw the section through the points so found. Figs. 195, 196, and 197 are illustrations accidentally omitted from earlier chapters. References to them will be found in Nos. 151 and 182.

This chapter concludes the present series of articles upon Practical Carpentry and Joinery. If further explanation is required on any point, a question, addressed to the Editor, will receive attention in our "Enquiry" columns.

Surveying and Sanitary Notes.

IN the ventilation of the Cunningham Memorial Free Church, Glasgow, now in course of erection (architects, Messrs. H. and D. Barclay), "Cousland's Improved Climax" Patent Direct-Acting Invisible Roof Ventilators are being used, supplied by the Climax Ventilating and Heating Company, 93, Hope Street, Glasgow.

THE New Schools, Sandwich, and the new Board Schools at Carrisborough, are being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators and special inlet tubes, supplied by Messrs. E. H. Shorland and Brother, of Manchester.

THE Bradford Corporation has on hand a large scheme for new sewage works. The cost of the whole scheme, including the construction of the huge conduit from Bradford, is estimated at £345,000; it provides for the Shipley works being given up, and 12,000,000 gallons of sewage being received and treated at Esholt every day. The carrying out of the scheme involves the purchase of the Esholt estate, the owners of which, it is said, are

was expressed by several speakers. Lord Farrer thought it was clear that Surrey had a claim upon the Thames and upon the affluents of the Thames in the first instance, but they must remember what the condition of things was. There was a growing demand on the part of London for water, and there was a growing feeling that, as far as the present sources of supply were concerned, the supply must come from the Thames. That was to say, that all the counties around London were feeling that it was wrong for London or the London water companies to sink deep wells in those counties to pump them dry for the benefit of Londoners and for the benefit of the dividends of the water companies. The companies proposed to draw more and more water from the Thames. Would the Thames bear that? What would be the condition of the Thames in such a summer as the last if the companies were allowed to draw inexhaustible supplies from it? Either the companies must go to some enormous further expense of storing the winter water which was wasted, or they must bring in an additional supply of water to London from distant sources. The question was, how far the Thames can be relied upon to supply both the counties through which it runs and London with water without turning it into a stinking ditch?

THE ratepayers of Darnall are indignant at the bad state of their roads, and their defective tramway system, and sanitary arrangements. They have held an indignation meeting and addressed the following letter to the Mayor and Corporation:—"Gentlemen,—We, the ratepayers of Darnall, in public meeting assembled, respectfully draw your attention to the neglected and disgraceful state of the roads and streets in this district, and assure you that they are not only a menace to public health, but a positive danger to those compelled to live in them or travel over them. At the same time we earnestly request that you will use all the powers you possess to put an end to the vile stench which comes from the Nunnery Colliery tip; also that you will instruct the Tramways Committee to take immediate steps to complete the section of tramway to Darnall.—Signed on behalf of the meeting, etc." A committee was appointed to take steps to secure the objects named in the petition.

THE Town Council of Falmouth have applied for sanction to borrow £6500 for the improvement of the Market Strand and the construction of an intercepting sewer in connection therewith. The Local Government Board have declined the application, on the grounds thus set forth in the official letter:—"The Board learn that the proposed improvement of the Market Strand involves the carrying out of certain alterations to the sewage tank at that place, and that, in fact, the main object of the scheme is to abate the nuisance which is caused by the existence of the tank on the foreshore. The Board are advised that the scheme proposed would not remedy the nuisance arising from the sewage tank, and that no proposal which involves the retention of the tank for sewage purposes should receive their approval. Acting upon this advice, the Board must decline to comply with the application as regards the Market Strand improvement or to sanction any further loan for the works of sewerage until the arrangements for disposing of the sewage have been put on a satisfactory footing. The Board would strongly urge the Town Council to instruct a competent engineer, who has had practical experience in carrying out schemes of drainage, to enquire into the whole matter of the sewerage and disposal of the sewage of the borough, and to prepare a thoroughly comprehensive scheme suited to the actual requirements of the borough."

A COMPETITION for a new club-house centrally situated at Crewe has just been held, limited to architects invited from Crewe, Southport, Burslem, and Leek. The designs of Messrs. Wm. Sugden and Son, F.R.I.B.A., have been placed first, and will be carried out by them.

A CONFERENCE of local authorities was held at Guildford to consider the proposals of the Woking Water Company to obtain fresh supplies. The Company proposes to sink wells near Guildford and at Shere and Albury, in the valley of the Tillingbourne, as well as to take water from the Thames near Chertsey. Strong opposition to the Company's proposals

THE PLASTERERS' STRIKE.

THE plasterers' strike has not yet—up to the time of going to press—taken a decisive turn. It is still an open question whether the present dispute will be peacefully adjusted, or whether the building trades of the country are on the eve of a long and disastrous struggle. The master builders of London held a meeting on Jan. 24th, at which they passed a resolution to the effect that they should “adopt and carry into effect at the earliest possible moment the policy proposed by the National Association of Master Builders”—with which association the Central Association in London is affiliated. This is regarded as equivalent to an intimation that a general lock-out of plasterers may be instituted at any moment. The National Association had arranged to meet at Bradford on January 31st, and the whole question was to be dealt with then; the future course of the struggle depends largely on that meeting. Whatever settlement is now arrived at will deal not only with the question of non-union foremen—the original matter in dispute—but will cover a much wider ground. Had the issue been confined to the one question, it is likely that the members of the Plasterers' Union would have decided that the point was not worth fighting about; but there are other matters upon which disagreement has long existed, and on these neither side shows any disposition to give way.

The master builders have drawn up an ultimatum, which refers not only to the question of foremen, but to such matters as the limitation of apprentices, the boycotting of certain firms, refusal to work with non-union men, and disputes as to the kind of work to be done by plasterers. If this ultimatum is indorsed in its entirety by the National Association and presented to the Plasterers' Union, it is extremely improbable that it will be accepted. Its rejection would probably lead to very serious developments, for it is expected that other trades would support the plasterers, and the strike or lock-out might extend to the other building trades as well.

Meanwhile, the London plasterers are baling out on the question of foremen—a step they should have taken long ago. The papers are to be returned next Tuesday, and if—as is not unlikely—the decision of the majority is against compelling foremen to become members of the union, it ought still to be possible to avert a serious struggle.

Another hopeful sign is the moderate and reasonable attitude of the executive of the Plasterers' Union. Mr. Dan Hennessey, the organising secretary of the London district, spoke with both wisdom and courage when, in an address to the Edmonton branch of the union last Saturday evening, he condemned the apathy and indifference of the bulk of the members, which had allowed the affairs of the district to get into the hands of a clique of extremists.

He thought the time had arrived when these petty squabbles with employers should come to an end. The association had improved the position of its members enormously during the past few years, and it was a mistaken policy to pile on the last straw which would break the camel's back. Mr. Hennessey went on to express the opinion that the strike was a mistake. They were prepared, he said, to meet the employers on the one point at issue, but if they demanded anything else the members of the Plasterers' Association must decide. He asked his hearers to remember that trade unions were not formed to promote the private fads of a few of their members, but to secure justice as between employers and employed and a settlement of differences in a way which was honourable to both.

These remarks, it is gratifying to note, elicited “loud cheers” from an audience composed entirely of members of the Plasterers' Union.

Builders' Notes.

It is alleged that a builder, in erecting several houses on the Battery Estate, Sandylands, Morecambe, has not built them in accordance with the plans presented to the Lancaster Rural District Council, the building line having been overstepped to the distance of about 2ft. The matter has been in dispute some time, but the work of erection has proceeded. Accordingly the Rural Council instructed their surveyor to take a number of men and pull down part of the premises. The party proceeded to the place and commenced their work. This the builder resented, and ejected both the surveyor and men from the premises. A large crowd of persons assembled to watch the issue of the dispute. On the advice of the law clerk the surveyor eventually withdrew his men. The matter, therefore, remains in abeyance for the present.

SPEAKING at the Annual Dinner of the Bristol Master Builders' Association, Mr. A. Krauss, the President of that body, referred to the National Association and its work. Some years ago, he said, the builders felt the want of combination, hence the National Association was formed; there had been some good work done, and especially in the last three years, but there was plenty of room for improvement. For years the National Association had tried with the Institute of Architects to get fair and proper universal contract, but they had failed. From a builders' point of view there always should be an arbitration clause. The architect wanted an arbitration clause which would leave every dispute until the end of the contract, and that he thought was a misguided idea. The great thing was to settle disputes as soon as they arose. The framing of the Workmen's Compensation Act had been well watched by the association; it was an Act which threw on them a great responsibility, and the only safeguard for the builder was to insure himself, and include the charges on the contracts he was

carrying out. Trade unions had also brought unfair restrictions on them, which were very heavily felt in many towns, such as the limitation of apprentices, non-union labour, or who should be allowed to lay cement floors, &c. But he was glad to say that in Bristol they had gone on fairly well with their men. They would agree with him that unions were necessary and justified, and had done good for the working men, and they had no objection to unions; but let them be carried out so that they would give right and justice to all parties, and prevent strikes and lock-outs, as nothing was gained by these on either side. He trusted a Board of Conciliation would before long be formed, which might be able to settle any differences without going to the extreme, and he hoped the younger members in the building trade might see a better and more peaceful time than some of them had seen.

At the Surveyors' Institute, London, an arbitration was opened on Jan. 23, before Mr. Robert Vigers (the president of the Institute), between Messrs. Ford and Messrs. Bemrose (Limited), both of Derby. From the opening statement of counsel it appeared that in May, 1895, Messrs. Bemrose and Co. Limited, who are well-known printers, contracted with the claimants (builders at Derby), for the erection of certain buildings at Derby for the sum of £10,559. The architect was Mr. Ridgway, and the contract was drawn up without any detailed statement or specification, being based on eight plans and a bill of quantities, as is not unusual in the North of England. The builders, finding early in the contract that the quantities were insufficient, called in a surveyor, who, after January, 1896, measured up the work done, and rendered detailed statements to Messrs. Bemrose. In September, 1896, the works were completed, and the cost, according to the measurements of the surveyor, was £15,316 1s. 1d. The sum of £8750 had been paid on account, and the claimants now sought to recover £6566 1s. 1d. due on the contract. A great part of the question turned on the legal interpretation of the contract, which specially prescribed that no alteration or variation should invalidate the contract, and that at the conclusion the architect should certify the sums due for payment.—Counsel for Messrs. Bemrose and Co. contended that the claimants had, as a matter of law, proceeded altogether upon a wrong basis. They had measured up and charged for the whole building independent of the contract. At the very outside they were only entitled to the extras at the contract price.—Mr. Hudson, counsel for Messrs. Ford, said if there had been a proper specification that might be so; but the quantities given were not sufficient to erect the building.—Considerable legal discussion arose on this point.—Ultimately Mr. Hudson stated that, at the request of the arbitrator, Messrs. Ford would prepare an account showing the difference in the quantities in the contract and the work done, and all the alterations and variations, with any difference in the contract price; and for this purpose the proceedings were adjourned for one month.

COMPLETE LIST OF CONTRACTS OPEN.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—			
Feb. 3	Annfield Plain, Durham—Erection of House	T. Shreeve	J. Norman, 24, Bridge-terrace, Annfield Plain.
3	Great Yarmouth—Additions to Premises	Visitors' Committee	C. G. Baker, Architect, Town Hall-chambers, Yarmouth.
3	Lancaster—Asylum Wards	Darton School Board	Clerk of Works, County Lunatic Asylum, Lancaster.
3	Staincross, near Barnsley—Erection of School		Senior and Clegg, 15, Regent-street, Barnsley.
3	Thorhill, Dewsbury—Erection of Houses		Holtom and Fox, Architects, Westgate, Dewsbury.
3	Whitby—Erection of Ashpits	Rural District Council	J. Jackson, Inspector of Nuisances, East-row, near Whitby.
3	London, E.—Lavatory Accommodation	St. George's-in-the-East Guardians	G. A. Wilson, Vestry Hall, Cable-street, E.
3	Brackenthwaite—Erection of Two Bridges	Cockermouth Rural District Council	J. B. Wilson, Engineer, Court-buildings, Cockermouth.
3	Luddenden Foot, near Halifax—Stabling, &c.		J. F. Walsh, Architect, Lancs. Yorks Bank-chbrs., Halifax.
3	Mountain Ash, Wales—Rebuilding Public House	Mrs G. Kenshole	G. Kenshole, Duffryn House, Ystrad Mynach.
4	West Hampstead—School	Aske's Haberdashers' School Managers	Widnell and Trollope, 20, Tothill-street, S.W.
4	Carlton, Yorks.—Erection of Class-room	School Board	W. E. Richardson, 23, Bond-street, Leeds.
4	Kingston-upon-Thames—Dining Hall, &c.	Workhouse Guardians	W. H. Hope, Union Offices, Kingston-upon-Thames.
4	Lancaster—Alterations to Premises	F. Wolfenden	C. F. Thompson, Architect, The Arcade, Lancaster.
6	Leeds—Alterations, &c., to Public Baths	Baths Committee	W. Hanstock and Son, Architects, Branch-road, Batley.
6	Nelson—Chapel Alterations		H. Whitaker, 21, Market-square, Nelson.
6	Wilton, Wilts.—Alterations to Workhouse Wards	Union Guardians	J. Harding and Son, 53, High-street, Salisbury.

COMPLETE LIST OF CONTRACTS OPEN—continued.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
BUILDINGS—Continued.			
Feb. 6	Benlech, Anglesey—Chapel Extension	School Board	J. Owen, Architect and Surveyor, Menai Bridge.
" 6	Newcastle-on-Tyne—School Alterations, &c.	School Board	W. L. Newcombe, 89, Pilgrim-street, Newcastle-upon-Tyne
" 6	Normanton-by-Derby—School Alterations, &c.	Improvement Committee	Naylor and Sale, Architects, Iron-gate, Derby.
" 7	Halifax—Bridge Work	Corporation	E. R. S. Escott, Borough Engineer, Town Hall, Halifax.
" 7	Salford—Erection of Public Hall	Corporation	Borough Engineer, Town Hall, Salford.
" 7	Troutbeck, near Wiadernere—Erection of Bridge	Guardians of North Dublin Union	J. Bintlcy, 7, Lowther-street, Kendal.
" 8	Dublin—Erection of Labourers' Dwellings	Fulham Vestry	— Morris, 24, Cabra-parade, Dublin.
" 8	London—Refuse Destructor and Electricity Works	County Infirmary	C. Botterill, Town Hall, Waltham Green.
" 9	Pendleton, Salford—Canal Retaining Walls, &c.	Corporation	J. Holt, 6, St. Mary's-gate, Manchester.
" 9	Sligo—Surgery Alterations, &c.	Guardians	Secretary, Grand Jury Office, Court House, Sligo.
" 9	Tayvallich, Scotland—Erection of Church	T. and J. Askell	N. Gillies, Architect, Lochgilphead.
" 10	York—Erection of Fence Wall, Railing, &c.	Urban District Council	A. Creer, City Engineer, Guildhall, York.
" 11	Cardiff—Extension of Mortuary	Guardians	Edwin Seward, Queen's-chambers, Cardiff.
" 11	Swindon—Rebuilding Inn	Urban District Council	W. Drew, 22, Victoria-street, Swindon.
" 13	Wimbledon—Isolation Hospital	Willesden District Council	C. H. Cooper, Council Offices, Broadway, Wimbledon.
" 14	Leeds—Church Works	Urban District Council	H. Walker, 8, Upper Fontaine-street, Leeds.
" 14	London, N.W.—Extension of Public Offices	Guardians	O. C. Robson, Offices, Dyne-road, Kilburn, N.W.
" 15	Letterkenny—Plastering	Glasgow International Exhibition	W. Hague, 50, Dawson-street, Dublin.
" 15	Rugby—Public Offices	Gen. Accident Assurance Corporation, Ltd.	D. G. Macdonald, Council's Surveyor, Windmill-lane, Rugby.
" 16	Hastings—Erection of Workhouse Buildings		Jeffery and Skiller, 5, Havelock-road, Hastings.
March 15	Glasgow—Exhibition Buildings		F. A. Healey, 141, Buchanan-street, Glasgow.
No date.	Abergavenny—Erection of Hospital		E. A. Johnson, Architect, Abergavenny.
"	Perth—Erection of Offices		G. P. K. Young, 42, Tay-street, Perth.
"	Wrexham—Erection of Hotel		W. Slater, 8a, High-street, Wrexham.
ENGINEERING—			
Feb. 3	Brigham, Cumberland—Laying Water Main	Cockermouth Rural District Council	J. B. Wilson, Engineer, Court-buildings, Cockermouth.
" 3	Edinburgh—Iron and Steel Works at Electric Station	Magistrates and Council	J. Cooper, 1, Parliament-square, Edinburgh.
" 4	Wexford—Deep Well Force Pumps, &c.	Guardians	D. E. McCarthy, Engineer, Board Room, Wexford.
" 6	Buxton—Electric Lighting Works	Urban District Council	J. Taylor, Clerk, Town Hall, Buxton.
" 6	Newton, Scotland—Widening Railway	Caledonian Railway Company	G. Graham, C.E., Buchanan-street, Glasgow.

Offices, 6, Poultry, London, E.C. Telephone No. 999 Bank.

SURREY.—Choice BUILDING ESTATE.

—In a charming district, two miles from Horley station (L.B. and S.C. Rly.) under one hour from London and adjoining a village where are church, shops, and post-office; two miles from Roman Catholic Church.

FOR SALE, a compact and valuable FREEHOLD PROPERTY of 53 acres, with a frontage to the main Brighton road of 2000ft., and perfectly ripe for development, with residences of a good class. Prestily timbered. Gas and water mains along the frontage. Would be divided.

Plans and full particulars of the owner's agents, Messrs. GREEN and SIMES, Auctioneers and Estate Agents, Blenheim Mansions, Queen Anne's-gate, London, S.W.; or Mr. W. M. LEACH, Auctioneer and Estate Agent, Crawley, Sussex.

FAIRMILE PARK, near Cobham, Surrey.—A FREEHOLD BUILDING ESTATE of about 40 acres, with possession.

MESSRS. DRIVER and CO. have received instructions to offer to AUCTION at the MART, Tokenhouse-yard, Lothbury, NEXT SPRING (unless previously sold by private contract), the above property, situate in a favourite residential district, about a quarter of an hour's walk from the Oxshott and Fairmile Station, and about a mile and a half from Cobham Station. The estate comprises Building Land, ripe for development, the higher portion (sloping to the south) possessing charming views over the intervening country to Epsom Downs; and a Residence known as "South Lodge," with stabling and garden; Eight small Villas, some Cottages, and the "Griffin" Beerhouse. On a portion of the estate brickearth is being worked, and will be included in the sale as a "going concern."

Particulars and plans, when ready, can be obtained of CHARLES JUPP, Esq., Solicitor, 48, Lime-street, E.C.; and of Messrs. DRIVER and Co., 23, Pall Mall, S.W.

By order of Trustees.—Preliminary Advertisement.—Freehold Building Estate, Streatham, near West Norwood Railway Station.

MESSRS. FIELD and SONS, and Messrs. WALFORD and WILSHIN, who are jointly concerned, will SELL by AUCTION, at the MART, at an early date, a valuable FREEHOLD BUILDING ESTATE, known as High View Park, comprising 16a. 1r. 10p., lying immediately at the rear of and with approach from Leigham Court-road; also a contiguous Freehold Building Site of 2a. and 5p. in a new road intended to connect Canterbury-grove with Thurlby-road.

Particulars and plan, in due course, of Messrs. KINGSFORD, DORMAN, and Co., Solicitors, 23, Essex-street, Strand; of Messrs. WALFORD and WILSHIN, Auctioneers, Anerley, S.E.; and of Messrs. FIELD and SONS, as above.

LEA VALLEY, PONDER'S END, and BROXBOURNE.—Freehold Wharf and Building Land, the latter with possession, some of which has been included in the schedule of the land required by the East London Waterworks Company.

MESSRS. NORTON, TRIST, and GILBERT will SELL by AUCTION, at the MART, Tokenhouse-yard, London, E.C., on TUESDAY, FEBRUARY 28th, 1899.

LOT 1.—8 acres 0 roods 11 perches of Land, with a frontage of 500ft. to the Lea and Stort Navigation Canal, also bounded on the north and east sides by the stream. This land is situate immediately opposite the Corticine Floor Covering Works, Ponders End, and is a fine site for the erection of a factory requiring waterside accommodation. It is in the occupation of Mr. Ives. This land has been scheduled to be acquired for the New Reservoir for which the East London Waterworks Company are applying for Parliamentary powers.

LOT 2.—14½ Acres of Freehold Building Land, with a frontage of 1080ft. to the road, close to Dobbs Weir, and within one and a half miles of Broxbourne Town and Station, now ripe for building purposes, possession of which can be given on completion of the purchase.

Particulars and conditions of Sale may be obtained from the Senior Official Receiver in Bankruptcy; of Messrs. CLARKE, RAWLINS, and Co., 66, Gresham House, London, E.C.; at the MART; and of the AUCTIONEERS, 70, Queen-street, Cheapside, London, E.C.

To Land Syndicates, Building Societies, Capitalists, and others.

PINNER.—Important Freehold Building Estate of over 47 acres, with residence, known as Barrow Point, occupying a beautiful position close to the quaint old village of Pinner, within five minutes from the railway station on the Metropolitan line, and extending to within about ½ of a mile of Pinner Station on the London and North-Western Railway, having easy access from the West-end and City. The whole ripe for immediate building operations, and admirably adapted for villa residences of a superior class.

MESSRS. FAREBROTHER, ELLIS, MEGERTON, BREACH, GALSWORDY, and CO. beg to announce that the above valuable PROPERTY, which they recently offered for Sale by Auction, may now be treated for privately.

No. 29, Fleet Street Temple Bar, and 18, Old Broad Street, E.C.

HONOR OAK.—Important Sale of FREEHOLD BUILDING LAND, forming an appreciable portion of one of the most salubrious and rapidly-increasing suburbs of the City of London, with numerous railway facilities to all parts of the metropolis, and presenting admirable sites for the erection of private Residences.

MESSRS. FAREBROTHER, ELLIS, MEGERTON, BREACH, GALSWORDY, and CO. are prepared to SELL the few REMAINING LOTS of the above FREEHOLD BUILDING ESTATE, by Private Contract.

No. 29, Fleet-street, Temple-bar, and 18, Old Broad-street, E.C.
